

Package ‘gtsummary’

June 13, 2020

Title Presentation-Ready Data Summary and Analytic Result
Tables

Version 1.3.2

Description Creates presentation-ready tables summarizing data sets, regression models, and more. The code to create the tables is concise and highly customizable. Data frames can be summarized with any function, e.g. `mean()`, `median()`, even user-written functions. Regression models are summarized and include the reference rows for categorical variables. Common regression models, such as logistic regression and Cox proportional hazards regression, are automatically identified and the tables are pre-filled with appropriate column headers.

add_global_p	Adds the global p-value for a categorical variables
--------------	---

Description

This function uses [car::Anova](#) with argument type = "III" to calculate global p-values for categorical variables. Output from `tbl_regression` and `tbl_uvregression` objects supported.

Usage

```
add_global_p(x, ...)
```

Arguments

x	tbl_regression or tbl_uvregression object
...	Further arguments passed to or from other methods.

Note

If a needed class of model is not supported by [car::Anova](#), please create a [GitHub Issue](#) to request support.

Author(s)

Daniel D. Sjoberg

See Also

[add_global_p.tbl_regression](#), [add_global_p.tbl_uvregression](#)

```
add_global_p.tbl_regression
```

Adds the global p-value for categorical variables

Description

This function uses [car::Anova](#) with argument `type = "III"` to calculate global p-values for categorical variables.

Usage

```
## S3 method for class 'tbl_regression'
add_global_p(
  x,
  include = x$table_body$variable[x$table_body$var_type %in% c("categorical",
    "interaction")],
  keep = FALSE,
  terms = NULL,
  quiet = NULL,
  ...
)
```

Arguments

<code>x</code>	Object with class <code>tbl_regression</code> from the tbl_regression function
<code>include</code>	Variables to calculate global p-value for. Input may be a vector of quoted or unquoted variable names. <code>tidyselect</code> and <code>gtsummary</code> select helper functions are also accepted. Default is <code>NULL</code> , which adds global p-values for all categorical and interaction terms.
<code>keep</code>	Logical argument indicating whether to also retain the individual p-values in the table output for each level of the categorical variable. Default is <code>FALSE</code>
<code>terms</code>	DEPRECATED. Use <code>include=</code> argument instead.
<code>quiet</code>	Logical indicating whether to print messages in console. Default is <code>FALSE</code>
<code>...</code>	Additional arguments to be passed to car::Anova

Value

A `tbl_regression` object

Note

If a needed class of model is not supported by [car::Anova](#), please create a [GitHub Issue](#) to request support.

Example Output

Author(s)

Daniel D. Sjoberg

Examples

```
tbl_lm_global_ex1 <-
  lm(marker ~ age + grade, trial) %>%
  tbl_regression() %>%
  add_global_p()
```

```
add_global_p.tbl_uvregression
```

Adds the global p-value for categorical variables

Description

This function uses `car::Anova` with argument `type = "III"` to calculate global p-values for categorical variables.

Usage

```
## S3 method for class 'tbl_uvregression'
add_global_p(x, quiet = NULL, ...)
```

Arguments

<code>x</code>	Object with class <code>tbl_uvregression</code> from the <code>tbl_uvregression</code> function
<code>quiet</code>	Logical indicating whether to print messages in console. Default is <code>FALSE</code>
<code>...</code>	Additional arguments to be passed to <code>car::Anova</code> .

Value

A `tbl_uvregression` object

Example Output**Author(s)**

Daniel D. Sjoberg

See Also

Other `tbl_uvregression` tools: `add_nevent.tbl_uvregression()`, `add_q()`, `bold_italicize_labels_levels`, `inline_text.tbl_uvregression()`, `modify_footnote()`, `modify_header()`, `modify_spanning_header()`, `tbl_merge()`, `tbl_stack()`, `tbl_uvregression()`

Examples

```
tbl_uv_global_ex2 <-
  trial[c("response", "trt", "age", "grade")] %>%
  tbl_uvregression(
    method = glm,
    y = response,
    method.args = list(family = binomial),
    exponentiate = TRUE
  ) %>%
  add_global_p()
```

add_n	Add column with N
-------	-------------------

Description

For each variable in a `tbl_summary` table, the `add_n` function adds a column with the total number of non-missing (or missing) observations

Usage

```
add_n(
  x,
  statistic = "{n}",
  col_label = "**N**",
  footnote = FALSE,
  last = FALSE,
  missing = NULL
)
```

Arguments

x	Object with class <code>tbl_summary</code> from the tbl_summary function
statistic	String indicating the statistic to report. Default is the number of non-missing observation for each variable, <code>statistic = "{n}"</code> . Other statistics available to report include: <ul style="list-style-type: none">"{N}" total number of observations,"{n}" number of non-missing observations,"{n_miss}" number of missing observations,"{p}" percent non-missing data,"{p_miss}" percent missing data The argument uses glue::glue syntax and multiple statistics may be reported, e.g. <code>statistic = "{n} / {N} ({p}%)"</code>
col_label	String indicating the column label. Default is <code>"**N**"</code>
footnote	Logical argument indicating whether to print a footnote clarifying the statistics presented. Default is <code>FALSE</code>
last	Logical indicator to include N column last in table. Default is <code>FALSE</code> , which will display N column first.
missing	DEPRECATED. Logical argument indicating whether to print N (<code>missing = FALSE</code>), or N missing (<code>missing = TRUE</code>). Default is <code>FALSE</code>

Value

A `tbl_summary` object

Example Output**Author(s)**

Daniel D. Sjoberg

Examples

```
tbl_n_ex <-
  trial[c("trt", "age", "grade", "response")] %>%
  tbl_summary(by = trt) %>%
  add_n()
```

add_nevent	<i>Add number of events to a regression table</i>
------------	---

Description

Adds a column of the number of events to tables created with [tbl_regression](#) or [tbl_uvregression](#). Supported model types include GLMs with binomial distribution family (e.g. [stats::glm](#), [lme4::glmer](#), and [geepack::geeglm](#)) and Cox Proportion Hazards regression models ([survival::coxph](#)).

Usage

```
add_nevent(x, ...)
```

Arguments

<code>x</code>	<code>tbl_regeression</code> or <code>tbl_uvregression</code> object
<code>...</code>	Additional arguments passed to or from other methods.

`add_nevent.tbl_regression`*Add number of events to a regression table*

Description

This function adds a column of the number of events to tables created with `tbl_regression`. Supported model types include GLMs with binomial distribution family (e.g. `stats::glm`, `lme4::glmer`, and `geepack::geeglm`) and Cox Proportion Hazards regression models (`survival::coxph`).

The number of events is added to the internal `.$table_body` tibble, and not printed in the default output table (similar to `N`). The number of events is accessible via the `inline_text` function for printing in a report.

Usage

```
## S3 method for class 'tbl_regression'
add_nevent(x, ...)
```

Arguments

<code>x</code>	<code>tbl_regression</code> object
<code>...</code>	Not used

Value

A `tbl_regression` object

Example Output

Author(s)

Daniel D. Sjoberg

See Also

Other `tbl_regression` tools: `add_global_p.tbl_regression()`, `add_q()`, `bold_italicize_labels_levels`, `combine_terms()`, `inline_text.tbl_regression()`, `modify_footnote()`, `modify_header()`, `modify_spanning_header()`, `tbl_merge()`, `tbl_regression()`, `tbl_stack()`

Examples

```
add_nevent_ex <-
  glm(response ~ trt, trial, family = binomial) %>%
  tbl_regression() %>%
  add_nevent()
```

add_nevent.tbl_uvregression

Add number of events to a regression table

Description

Adds a column of the number of events to tables created with [tbl_uvregression](#). Supported model types include GLMs with binomial distribution family (e.g. [stats::glm](#), [lme4::glmer](#), and [geepack::geeglm](#)) and Cox Proportion Hazards regression models ([survival::coxph](#)).

Usage

```
## S3 method for class 'tbl_uvregression'
add_nevent(x, ...)
```

Arguments

x	tbl_uvregression object
...	Not used

Value

A tbl_uvregression object

Reporting Event N

The number of events is added to the internal `.$table_body` tibble, and printed to the right of the N column. The number of events is also accessible via the [inline_text](#) function for printing in a report.

Example Output

Author(s)

Daniel D. Sjoberg

See Also

Other `tbl_uvregression` tools: [add_global_p.tbl_uvregression\(\)](#), [add_q\(\)](#), [bold_italicize_labels_levels](#), [inline_text.tbl_uvregression\(\)](#), [modify_footnote\(\)](#), [modify_header\(\)](#), [modify_spanning_header\(\)](#), [tbl_merge\(\)](#), [tbl_stack\(\)](#), [tbl_uvregression\(\)](#)

Examples

```
tbl_uv_nevent_ex <-
  trial[c("response", "trt", "age", "grade")] %>%
  tbl_uvregression(
    method = glm,
    y = response,
    method.args = list(family = binomial)
  ) %>%
  add_nevent()
```

add_overall	<i>Add column with overall summary statistics</i>
-------------	---

Description

Adds a column with overall summary statistics to tables created by `tbl_summary`.

Usage

```
add_overall(x, last = FALSE)
```

Arguments

<code>x</code>	Object with class <code>tbl_summary</code> from the tbl_summary function
<code>last</code>	Logical indicator to display overall column last in table. Default is <code>FALSE</code> , which will display overall column first.

Value

A `tbl_summary` object

Example Output

Author(s)

Daniel D. Sjoberg

See Also

Other `tbl_summary` tools: [add_n\(\)](#), [add_p.tbl_summary\(\)](#), [add_q\(\)](#), [add_stat_label\(\)](#), [bold_italicize_labels.tbl_summary\(\)](#), [inline_text.tbl_summary\(\)](#), [inline_text.tbl_survfit\(\)](#), [modify_footnote\(\)](#), [modify_header\(\)](#), [modify_spanning_header\(\)](#), [tbl_merge\(\)](#), [tbl_stack\(\)](#), [tbl_summary\(\)](#)

Examples

```
tbl_overall_ex <-
  trial[c("age", "grade", "trt")] %>%
  tbl_summary(by = trt) %>%
  add_overall()
```

add_p	<i>Adds p-values to gtsummary table</i>
-------	---

Description

Adds p-values to gtsummary table

Usage

```
add_p(x, ...)
```

Arguments

x	Object created from a gtsummary function
...	Additional arguments passed to other methods.

Author(s)

Daniel D. Sjoberg

See Also

[add_p.tbl_summary](#), [add_p.tbl_cross](#)

add_p.tbl_cross	<i>Adds p-value to crosstab table</i>
-----------------	---------------------------------------

Description

Experimental Calculate and add a p-value comparing the two variables in the cross table. Missing values are included in p-value calculations.

Usage

```
## S3 method for class 'tbl_cross'
add_p(x, test = NULL, pvalue_fun = NULL, source_note = FALSE, ...)
```

Arguments

x	Object with class tbl_cross from the tbl_cross function
test	A string specifying statistical test to perform. Default is "chisq.test" when expected cell counts ≥ 5 and "fisher.test" when expected cell counts < 5 .
pvalue_fun	Function to round and format p-value. Default is style_pvalue , except when source_note = TRUE when the default is style_pvalue(x, prepend_p = TRUE)
source_note	Logical value indicating whether to show p-value in the {gt} table source notes rather than a column.
...	Not used

Example Output

Author(s)

Karissa Whiting

See Also

Other `tbl_cross` tools: [inline_text.tbl_cross\(\)](#), [tbl_cross\(\)](#)

Examples

```
add_p_cross_ex1 <-
  trial %>%
  tbl_cross(row = stage, col = trt) %>%
  add_p()

add_p_cross_ex2 <-
  trial %>%
  tbl_cross(row = stage, col = trt) %>%
  add_p(source_note = TRUE)
```

<code>add_p.tbl_summary</code>	<i>Adds p-values to summary tables</i>
--------------------------------	--

Description

Adds p-values to tables created by `tbl_summary` by comparing values across groups.

Usage

```
## S3 method for class 'tbl_summary'
add_p(
  x,
  test = NULL,
  pvalue_fun = NULL,
  group = NULL,
  include = everything(),
  exclude = NULL,
  ...
)
```

Arguments

<code>x</code>	Object with class <code>tbl_summary</code> from the tbl_summary function
<code>test</code>	List of formulas specifying statistical tests to perform, e.g. <code>list(all_continuous() ~ "t.test", all_categorical() ~ "fisher.test")</code> . Options include <ul style="list-style-type: none"> • <code>"t.test"</code> for a t-test, • <code>"aov"</code> for a one-way ANOVA test,

- `"wilcox.test"` for a Wilcoxon rank-sum test,
- `"kruskal.test"` for a Kruskal-Wallis rank-sum test,
- `"chisq.test"` for a chi-squared test of independence,
- `"chisq.test.no.correct"` for a chi-squared test of independence without continuity correction,
- `"fisher.test"` for a Fisher's exact test,
- `"lme4"` for a random intercept logistic regression model to account for clustered data, `lme4::glmer(by ~ variable + (1 | group), family = binomial)`. The `by` argument must be binary for this option.

Tests default to `"kruskal.test"` for continuous variables, `"chisq.test"` for categorical variables with all expected cell counts ≥ 5 , and `"fisher.test"` for categorical variables with any expected cell count < 5 . A custom test function can be added for all or some variables. See below for an example.

<code>pvalue_fun</code>	Function to round and format p-values. Default is style_pvalue . The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. <code>pvalue_fun = function(x) style_pvalue(x, digits = 2)</code> or equivalently, <code>purrr::partial(style_pvalue, digits = 2)</code>).
<code>group</code>	Column name (unquoted or quoted) of an ID or grouping variable. The column can be used to calculate p-values with correlated data (e.g. when the test argument is <code>"lme4"</code>). Default is <code>NULL</code> . If specified, the row associated with this variable is omitted from the summary table.
<code>include</code>	Variables to include in output. Input may be a vector of quoted variable names, unquoted variable names, or <code>tidyselect</code> select helper functions. Default is <code>everything()</code> .
<code>exclude</code>	DEPRECATED
<code>...</code>	Not used

Value

A `tbl_summary` object

Setting Defaults

If you like to consistently use a different function to format p-values or estimates, you can set options in the script or in the user- or project-level startup file, `'.Rprofile'`. The default confidence level can also be set. Please note the default option for the estimate is the same as it is for `tbl_regression()`.

- `options(gtsummary.pvalue_fun = new_function)`

Example Output

Author(s)

Emily C. Zabor, Daniel D. Sjoberg

See Also

See `tbl_summary` [vignette](#) for detailed examples

Other `tbl_summary` tools: [add_n\(\)](#), [add_overall\(\)](#), [add_q\(\)](#), [add_stat_label\(\)](#), [bold_italicize_labels_levels](#), [inline_text.tbl_summary\(\)](#), [inline_text.tbl_survfit\(\)](#), [modify_footnote\(\)](#), [modify_header\(\)](#), [modify_spanning_header\(\)](#), [tbl_merge\(\)](#), [tbl_stack\(\)](#), [tbl_summary\(\)](#)

Examples

```
# Example 1 -----
add_p_ex1 <-
  trial[c("age", "grade", "trt")] %>%
  tbl_summary(by = trt) %>%
  add_p()

# Example 2 -----
# Conduct a custom McNemar test for response,
# Function must return a named list of the p-value and the
# test name: list(p = 0.123, test = "McNemar's test")
# The '...' must be included as input
# This feature is experimental, and the API may change in the future
my_mcnemar <- function(data, variable, by, ...) {
  result <- list()
  result$p <- stats::mcnemar.test(data[[variable]], data[[by]])$p.value
  result$test <- "McNemar's test"
  result
}

add_p_ex2 <-
  trial[c("response", "trt")] %>%
  tbl_summary(by = trt) %>%
  add_p(test = response ~ "my_mcnemar")
```

add_q	Add a column of q-values to account for multiple comparisons
-------	--

Description

Adjustments to p-values are performed with [stats::p.adjust](#).

Usage

```
add_q(x, method = "fdr", pvalue_fun = NULL, quiet = NULL)
```

Arguments

x	a gtsummary object
method	String indicating method to be used for p-value adjustment. Methods from stats::p.adjust are accepted. Default is <code>method = "fdr"</code> .
pvalue_fun	Function to round and format p-values. Default is style_pvalue . The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. <code>pvalue_fun = function(x) style_pvalue(x, digits = 2)</code> or equivalently, <code>purrr::partial(style_pvalue, digits = 2)</code>).

quiet Logical indicating whether to print messages in console. Default is FALSE

Example Output

Author(s)

Esther Drill, Daniel D. Sjoberg

Examples

```
# Example 1 -----
add_q_ex1 <-
  trial[c("trt", "age", "grade", "response")] %>%
  tbl_summary(by = trt) %>%
  add_p() %>%
  add_q()

# Example 2 -----
add_q_ex2 <-
  trial[c("trt", "age", "grade", "response")] %>%
  tbl_uvregression(
    y = response,
    method = glm,
    method.args = list(family = binomial),
    exponentiate = TRUE
  ) %>%
  add_global_p() %>%
  add_q()
```

add_stat	Add a custom statistic column
----------	-------------------------------

Description

Experimental The function allows a user to add a new column with a custom, user-defined statistic.

Usage

```
add_stat(
  x,
  fns,
  fmt_fun = NULL,
  header = "**Statistic**",
  footnote = NULL,
  new_col_name = NULL
)
```

Arguments

x	tbl_summary object
fns	list of formulas indicating the functions that create the statistic
fmt_fun	for numeric statistics, fmt_fun= is the styling/formatting function. Default is NULL
header	Column header of new column. Default is "**Statistic**"
footnote	Footnote associated with new column. Default is no footnote (i.e. NULL)
new_col_name	name of new column to be created in .stable_body. Default is "add_stat_1", unless that column exists then it is "add_stat_2", etc.

Details

The custom functions passed in fns= are required to follow a specified format. Each of these function will execute on a single variable from tbl_summary().

1. Each function must return a single scalar or character value of length one.
2. Each function may take the following arguments: foo(data, variable, by, tbl)
 - data= is the input data frame passed to tbl_summary()
 - variable= is a string indicating the variable to perform the calculation on
 - by= is a string indicating the by variable from tbl_summary=, if present
 - tbl= the original tbl_summary() object is also available to utilize

The user-defined does not need to utilize each of these inputs. It's encouraged the user-defined function accept ... as each of the arguments *will* be passed to the function, even if not all inputs are utilized by the user's function, e.g. foo(data, variable, by, ...)

Example Output**Examples**

```
# Example 1 -----
# this example replicates `add_p()`

# fn returns t-test pvalue
my_ttest <- function(data, variable, by, ...) {
  t.test(data[[variable]] ~ as.factor(data[[by]]))$p.value
}
```

```

add_stat_ex1 <-
  trial %>%
  select(trt, age, marker) %>%
  tbl_summary(by = trt, missing = "no") %>%
  add_p(test = everything() ~ t.test) %>%
  # replicating result of `add_p()` with `add_stat()`
  add_stat(
    fns = everything() ~ my_ttest, # all variables compared with with t-test
    fmt_fun = style_pvalue,        # format result with style_pvalue()
    header = "**My p-value**"       # new column header
  )

# Example 2 -----
# fn returns t-test test statistic and pvalue
my_ttest2 <- function(data, variable, by, ...) {
  tt <- t.test(data[[variable]] ~ as.factor(data[[by]]))

  # returning test statistic and pvalue
  stringr::str_glue(
    "t={style_sigfig(tt$statistic)}, {style_pvalue(tt$p.value, prepend_p = TRUE)}"
  )
}

add_stat_ex2 <-
  trial %>%
  select(trt, age, marker) %>%
  tbl_summary(by = trt, missing = "no") %>%
  add_stat(
    fns = everything() ~ my_ttest2, # all variables will be compared by t-test
    fmt_fun = NULL, # fn returns and chr, so no formatting function needed
    header = "**Treatment Comparison**", # column header
    footnote = "T-test statistic and p-value" # footnote
  )
# Example 1 -----

```

add_stat_label	<i>Add statistic labels</i>
----------------	-----------------------------

Description

Adds labels describing the summary statistics presented for each variable in the [tbl_summary](#) table.

Usage

```
add_stat_label(x, location = NULL, label = NULL)
```

Arguments

x	Object with class <code>tbl_summary</code> from the tbl_summary function
location	location where statistic label will be included. "row" (the default) to add the statistic label to the variable label row, and "column" adds a column with the statistic label.
label	a list of formulas or a single formula updating the statistic label, e.g. <code>label = all_categorical() ~ "No. (%)"</code>

Value

A `tbl_summary` object

Example Output**Author(s)**

Daniel D. Sjoberg

tbl <- trial %>%
  dplyr::select(trt, age, grade, response) %>%
  tbl_summary(by = trt)

# Example 1 -----
# Add statistic presented to the variable label row
add_stat_label_ex1 <-
  tbl %>%
  add_stat_label(
    # update default statistic label for continuous variables
    label = all_continuous() ~ "med. (iqr)"
  )

# Example 2 -----
add_stat_label_ex2 <-
  tbl %>%
  add_stat_label(
    # add a new column with statistic labels
    location = "column"
  )
```

as_flextable

Convert gtsummary object to a flextable object

Description

Experimental Function converts a `gtsummary` object to a `flextable` object. A user can use this function if they wish to add customized formatting available via the `flextable` functions. The `flextable` output is particularly useful when combined with R markdown with Word output, since the `gt` package does not support Word.

Usage

```
as_flextable(x, ...)

## S3 method for class 'gtsummary'
as_flextable(
  x,
  include = everything(),
  return_calls = FALSE,
  strip_md_bold = TRUE,
  ...
)
```

Arguments

x	Object created by a function from the gtsummary package (e.g. tbl_summary or tbl_regression)
...	Not used
include	Commands to include in output. Input may be a vector of quoted or unquoted names. tidyselect and gtsummary select helper functions are also accepted. Default is everything().
return_calls	Logical. Default is FALSE. If TRUE, the calls are returned as a list of expressions.
strip_md_bold	When TRUE, all double asterisk (markdown language for bold weight) in column labels and spanning headers are removed. Default is TRUE

Value

A flextable object

Details

The `as_flextable()` takes the data frame that will be printed and converts it to a flextable and formats the table with the following flextable functions.

1. [flextable::flextable\(\)](#)
2. [flextable::set_header_labels\(\)](#) to set column labels
3. [flextable::add_header_row\(\)](#), if applicable, to set spanning column header
4. [flextable::align\(\)](#) to set column alignment
5. [flextable::padding\(\)](#) to indent variable levels
6. [flextable::fontsize\(\)](#) to set font size
7. [flextable::autofit\(\)](#) to estimate the column widths
8. [flextable::footnote\(\)](#) to add table footnotes and source notes
9. [flextable::bold\(\)](#) to bold cells in data frame
10. [flextable::italic\(\)](#) to italicize cells in data frame

Any one of these commands may be omitted using the `include=` argument.

Pro tip: Use the [flextable::width\(\)](#) function for exacting control over column width after calling [as_flextable\(\)](#).

Daniel D. Sjoberg

See AlsoOther gtsummary output types: [as_gt\(\)](#), [as_kable_extra\(\)](#), [as_kable\(\)](#), [as_tibble.gtsummary\(\)](#)**Examples**

```
trial %>%
  select(trt, age, grade) %>%
  tbl_summary(by = trt) %>%
  add_p() %>%
  as_flextable()
```

as_gt	<i>Convert gtsummary object to a gt object</i>
-------	--

Description

Function converts a gtsummary object to a gt_tbl object. Function is used in the background when the results are printed or knit. A user can use this function if they wish to add customized formatting available via the [gt package](#).

Review the [tbl_summary vignette](#) or [tbl_regression vignette](#) for detailed examples in the 'Advanced Customization' section.

Usage

```
as_gt(
  x,
  include = everything(),
  return_calls = FALSE,
  exclude = NULL,
  omit = NULL
)
```

Arguments

x	Object created by a function from the gtsummary package (e.g. tbl_summary or tbl_regression)
include	Commands to include in output. Input may be a vector of quoted or unquoted names. tidyselect and gtsummary select helper functions are also accepted. Default is everything().
return_calls	Logical. Default is FALSE. If TRUE, the calls are returned as a list of expressions.
exclude	DEPRECATED.
omit	DEPRECATED.

Value

A gt_tbl object

Example Output

Author(s)

Daniel D. Sjoberg

Other gtsummary output types: [as_flextable\(\)](#), [as_kable_extra\(\)](#), [as_kable\(\)](#), [as_tibble.gtsummary\(\)](#)

Examples

```
as_gt_ex <-
  trial[c("trt", "age", "response", "grade")] %>%
  tbl_summary(by = trt) %>%
  as_gt()
```

as_kable	<i>Convert gtsummary object to a kable object</i>
----------	---

Description

Function converts a gtsummary object to a knitr_kable object. This function is used in the background when the results are printed or knit. A user can use this function if they wish to add customized formatting available via [knitr::kable](#).

Output from [knitr::kable](#) is less full featured compared to summary tables produced with [gt](#). For example, kable summary tables do not include indentation, footnotes, or spanning header rows.

Usage

```
as_kable(x, include = everything(), return_calls = FALSE, exclude = NULL, ...)
```

Arguments

x	Object created by a function from the gtsummary package (e.g. tbl_summary or tbl_regression)
include	Commands to include in output. Input may be a vector of quoted or unquoted names. tidyselect and gtsummary select helper functions are also accepted. Default is everything(), which includes all commands in x\$kable_calls.
return_calls	Logical. Default is FALSE. If TRUE, the calls are returned as a list of expressions.
exclude	DEPRECATED
...	Additional arguments passed to knitr::kable

Details

Tip: To better distinguish variable labels and level labels when indenting is not supported, try [bold_labels\(\)](#) or [italicize_levels\(\)](#).

Value

A knitr_kable object

  tbl_summary(by = trt) %>%
  bold_labels() %>%
  as_kable()
```

as_kable_extra

Convert gtsummary object to a kableExtra object

Description

Experimental Function converts a gtsummary object to a knitr_kable + kableExtra object. A user can use this function if they wish to add customized formatting available via [knitr::kable](#) and kableExtra. Note that gtsummary uses the standard markdown ****** to bold headers, and they may need to be changed manually with kableExtra output.

Usage

```
as_kable_extra(
  x,
  include = everything(),
  return_calls = FALSE,
  strip_md_bold = TRUE,
  ...
)
```

Arguments

x	Object created by a function from the gtsummary package (e.g. tbl_summary or tbl_regression)
include	Commands to include in output. Input may be a vector of quoted or unquoted names. tidyselect and gtsummary select helper functions are also accepted. Default is everything(), which includes all commands in x\$kable_calls.
return_calls	Logical. Default is FALSE. If TRUE, the calls are returned as a list of expressions.
strip_md_bold	When TRUE, all double asterisk (markdown language for bold weight) in column labels and spanning headers are removed. Default is TRUE
...	Additional arguments passed to knitr::kable

Value

A kableExtra object

```

as_tibble.gtsummary	<i>Convert gtsummary object to a tibble</i>
---------------------	---

Description

Function converts gtsummary objects tibbles. The formatting stored in x\$kable_calls is applied.

Usage

```
## S3 method for class 'gtsummary'
as_tibble(
  x,
  include = everything(),
  col_labels = TRUE,
  return_calls = FALSE,
  exclude = NULL,
  ...
)
```

Arguments

x	Object created by a function from the gtsummary package (e.g. tbl_summary or tbl_regression)
include	Commands to include in output. Input may be a vector of quoted or unquoted names. tidyselect and gtsummary select helper functions are also accepted. Default is everything(), which includes all commands in x\$kable_calls.
col_labels	Logical argument adding column labels to output tibble. Default is TRUE.
return_calls	Logical. Default is FALSE. If TRUE, the calls are returned as a list of expressions.
exclude	DEPRECATED
...	Not used

Value

a [tibble](#)

Author(s)

Daniel D. Sjoberg

```
tbl <-  
  trial %>%  
    select(trt, age, grade, response) %>%  
    tbl_summary(by = trt)  
  
as_tibble(tbl)  
  
# without column labels  
as_tibble(tbl, col_labels = FALSE)
```

`bold_italicize_labels_levels`

Bold or Italicize labels or levels in gtsummary tables

Description

Bold or Italicize labels or levels in gtsummary tables

Usage

```
bold_labels(x)
```

```
bold_levels(x)
```

```
italicize_labels(x)
```

```
italicize_levels(x)
```

Arguments

x Object created using gtsummary functions

Value

Functions return the same class of gtsummary object supplied

Functions

- `bold_labels`: Bold labels in gtsummary tables
- `bold_levels`: Bold levels in gtsummary tables
- `italicize_labels`: Italicize labels in gtsummary tables
- `italicize_levels`: Italicize levels in gtsummary tables

Example Output

Author(s)

Daniel D. Sjoberg

Examples

```
tbl_bold_ital_ex <-
  trial[c("trt", "age", "grade")] %>%
  tbl_summary() %>%
  bold_labels() %>%
  bold_levels() %>%
  italicize_labels() %>%
  italicize_levels()
```

bold_p

Bold significant p-values or q-values

Description

Bold values below a chosen threshold (e.g. <0.05) in a gtsummary tables.

Usage

```
bold_p(x, t = 0.05, q = FALSE)
```

Arguments

x	Object created using gtsummary functions
t	Threshold below which values will be bold. Default is 0.05.
q	Logical argument. When TRUE will bold the q-value column rather than the p-values. Default is FALSE.

Example Output**Author(s)**

Daniel D. Sjoberg, Esther Drill

Examples

```
# Example 1 -----
bold_p_ex1 <-
  trial[c("age", "grade", "response", "trt")] %>%
  tbl_summary(by = trt) %>%
  add_p() %>%
  bold_p(t = 0.65)

# Example 2 -----
bold_p_ex2 <-
  glm(response ~ trt + grade, trial, family = binomial(link = "logit")) %>%
  tbl_regression(exponentiate = TRUE) %>%
  bold_p(t = 0.65)
```

combine_terms

Combine terms in a regression model

Description

Experimental The function combines terms from a regression model, and replaces the terms with a single row in the output table. The p-value is calculated using `stats::anova()`.

Usage

```
combine_terms(x, formula_update, label = NULL, quiet = NULL, ...)
```

Arguments

x	a tbl_regression object
formula_update	formula update passed to the <code>stats::update</code> . This updated formula is used to construct a reduced model, and is subsequently passed to <code>stats::anova()</code> to calculate the p-value for the group of removed terms. See the <code>stats::update</code> help file for proper syntax. function's formula.= argument
label	Option string argument labeling the combined rows
quiet	Logical indicating whether to print messages in console. Default is FALSE
...	Additional arguments passed to <code>stats::anova</code>

Value

tbl_regression object

Example Output**Author(s)**

Daniel D. Sjoberg

Examples

```
# Example 1 -----
# fit model with nonlinear terms for marker
nlmod1 <- lm(
  age ~ marker + I(marker^2) + grade,
  trial[c("age", "marker", "grade")] %>% na.omit() # keep complete cases only!
)

combine_terms_ex1 <-
  tbl_regression(nlmod1, label = grade ~ "Grade") %>%
  # collapse non-linear terms to a single row in output using anova
  combine_terms(
    formula_update = . ~ . - marker - I(marker^2),
    label = "Marker (non-linear terms)"
  )

# Example 2 -----
# Example with Cubic Splines
library(Hmisc, warn.conflicts = FALSE, quietly = TRUE)
mod2 <- lm(
  age ~ rcspline.eval(marker, inclx = TRUE) + grade,
  trial[c("age", "marker", "grade")] %>% na.omit() # keep complete cases only!
)

combine_terms_ex2 <-
  tbl_regression(mod2, label = grade ~ "Grade") %>%
  combine_terms(
    formula_update = . ~ . - rcspline.eval(marker, inclx = TRUE),
    label = "Marker (non-linear terms)"
  )

# Example 3 -----
# Logistic Regression Example, LRT p-value
combine_terms_ex3 <-
  glm(
    response ~ marker + I(marker^2) + grade,
    trial[c("response", "marker", "grade")] %>% na.omit(), # keep complete cases only!
    family = binomial
```

```

) %>%
tbl_regression(label = grade ~ "Grade", exponentiate = TRUE) %>%
# collapse non-linear terms to a single row in output using anova
combine_terms(
  formula_update = . ~ . - marker - I(marker^2),
  label = "Marker (non-linear terms)",
  test = "LRT"
)

```

gtsummary_logo

The gtsummary logo, using ASCII or Unicode characters

Description

Use `crayon::strip_style()` to get rid of the colors.

Usage

```
gtsummary_logo(unicode = 110n_info()$`UTF-8`)
```

Arguments

unicode Whether to use Unicode symbols. Default is TRUE on UTF-8 platforms.

Examples

```
gtsummary_logo()
```

inline_text

Report statistics from gtsummary tables inline

Description

Report statistics from gtsummary tables inline

Usage

```
inline_text(x, ...)
```

Arguments

x Object created from a gtsummary function
... Additional arguments passed to other methods.

Value

A string reporting results from a gtsummary table

Author(s)

Daniel D. Sjoberg

`inline_text.tbl_cross` *Report statistics from cross table inline*

Description

Experimental Extracts and returns statistics from a `tbl_cross` object for inline reporting in an R markdown document. Detailed examples in the [inline_text vignette](#)

Usage

```
## S3 method for class 'tbl_cross'
inline_text(x, col_level = NULL, row_level = NULL, pvalue_fun = NULL, ...)
```

Arguments

<code>x</code>	a <code>tbl_cross</code> object
<code>col_level</code>	Level of the column variable to display. Default is <code>NULL</code> . Can also specify "p.value" for the p-value and "stat_0" for Total column.
<code>row_level</code>	Level of the row variable to display. Can also specify the 'Unknown' row. Default is <code>NULL</code> .
<code>pvalue_fun</code>	Function to round and format p-values. Default is style_pvalue . The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. <code>pvalue_fun = function(x) style_pvalue(x, digits = 2)</code> or equivalently, <code>purrr::partial(style_pvalue, digits = 2)</code>).
<code>...</code>	Not used

Value

A string reporting results from a gtsummary table

See Also

Other `tbl_cross` tools: [add_p.tbl_cross\(\)](#), [tbl_cross\(\)](#)

Examples

```
tbl_cross <-
  tbl_cross(trial, row = trt, col = response) %>%
  add_p()

inline_text(tbl_cross, row_level = "Drug A", col_level = "1")
inline_text(tbl_cross, row_level = "Total", col_level = "1")
inline_text(tbl_cross, col_level = "p.value")
```

```
inline_text.tbl_regression
```

Report statistics from regression summary tables inline

Description

Takes an object with class `tbl_regression`, and the location of the statistic to report and returns statistics for reporting inline in an R markdown document. Detailed examples in the [inline_text vignette](#)

Usage

```
## S3 method for class 'tbl_regression'
inline_text(
  x,
  variable,
  level = NULL,
  pattern = "{estimate} ({conf.level*100}% CI {conf.low}, {conf.high}; {p.value})",
  estimate_fun = x$fmt_fun$estimate,
  pvalue_fun = NULL,
  ...
)
```

Arguments

<code>x</code>	Object created from tbl_regression
<code>variable</code>	Variable name of statistics to present
<code>level</code>	Level of the variable to display for categorical variables. Default is <code>NULL</code> , returning the top row in the table for the variable.
<code>pattern</code>	String indicating the statistics to return. Uses glue::glue formatting. Default is <code>"{estimate} ({conf.level}% CI {conf.low}, {conf.high}; {p.value})"</code> . All columns from <code>x\$table_body</code> are available to print as well as the confidence level (<code>conf.level</code>). See below for details.
<code>estimate_fun</code>	function to style model coefficient estimates. Columns <code>'estimate'</code> , <code>'conf.low'</code> , and <code>'conf.high'</code> are formatted. Default is <code>x\$inputs\$estimate_fun</code>
<code>pvalue_fun</code>	function to style p-values and/or q-values. Default is <code>function(x) style_pvalue(x, prepend_p = TRUE)</code>
<code>...</code>	Not used

Value

A string reporting results from a gtsummary table

pattern argument

The following items are available to print. Use `print(x$table_body)` to print the table the estimates are extracted from.

- `{estimate}` coefficient estimate formatted with `'estimate_fun'`

- {conf.low} lower limit of confidence interval formatted with 'estimate_fun'
- {conf.high} upper limit of confidence interval formatted with 'estimate_fun'
- {ci} confidence interval formatted with x\$estimate_fun
- {p.value} p-value formatted with 'pvalue_fun'
- {N} number of observations in model
- {label} variable/variable level label

inline_text_ex1 <-
  glm(response ~ age + grade, trial, family = binomial(link = "logit")) %>%
  tbl_regression(exponentiate = TRUE)

inline_text(inline_text_ex1, variable = age)
inline_text(inline_text_ex1, variable = grade, level = "III")
```

```
inline_text.tbl_summary
```

Report statistics from summary tables inline

Description

Extracts and returns statistics from a `tbl_summary` object for inline reporting in an R markdown document. Detailed examples in the [inline_text vignette](#)

Usage

```
## S3 method for class 'tbl_summary'
inline_text(
  x,
  variable,
  column = NULL,
  level = NULL,
  pattern = NULL,
  pvalue_fun = NULL,
  ...
)
```

Arguments

<code>x</code>	Object created from tbl_summary
<code>variable</code>	Variable name of statistic to present
<code>column</code>	Column name to return from <code>x\$table_body</code> . Can also pass the level of a by variable.
<code>level</code>	Level of the variable to display for categorical variables. Can also specify the 'Unknown' row. Default is NULL
<code>pattern</code>	String indicating the statistics to return. Uses glue::glue formatting. Default is pattern shown in <code>tbl_summary()</code> output
<code>pvalue_fun</code>	Function to round and format p-values. Default is style_pvalue . The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. <code>pvalue_fun = function(x) style_pvalue(x, digits = 2)</code> or equivalently, <code>purrr::partial(style_pvalue, digits = 2)</code>).
<code>...</code>	Not used

```

```
inline_text.tbl_survfit
```

Report statistics from survfit tables inline

Description

Experimental Extracts and returns statistics from a `tbl_survfit` object for inline reporting in an R markdown document. Detailed examples in the [inline_text vignette](#)

Usage

```
## S3 method for class 'tbl_survfit'
inline_text(
  x,
  time = NULL,
  prob = NULL,
  level = NULL,
  estimate_fun = NULL,
  pvalue_fun = NULL,
  ...
)
```

Arguments

x	Object created from tbl_survfit
time	time for which to return survival probabilities.
prob	probability with values in (0,1)
level	Level of the variable to display for categorical variables. Can also specify the 'Unknown' row. Default is NULL
estimate_fun	Function to round and format coefficient estimates. Default is style_sigfig when the coefficients are not transformed, and style_ratio when the coefficients have been exponentiated.
pvalue_fun	Function to round and format p-values. Default is style_pvalue . The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. <code>pvalue_fun = function(x) style_pvalue(x,digits = 2)</code> or equivalently, <code>purrr::partial(style_pvalue,digits = 2)</code>).
...	<code>tbl_survfit</code> used

inline_text(tbl2, prob = 0.5)

```

```
inline_text.tbl_uvregression
```

Report statistics from regression summary tables inline

Description

Extracts and returns statistics from a table created by the `tbl_uvregression` function for inline reporting in an R markdown document. Detailed examples in the [inline_text vignette](#)

Usage

```

## S3 method for class 'tbl_uvregression'
inline_text(
  x,
  variable,
  level = NULL,
  pattern = "{estimate} ({conf.level*100}% CI {conf.low}, {conf.high}; {p.value})",
  estimate_fun = x$fmt_fun$estimate,
  pvalue_fun = NULL,
  ...
)

```

Arguments

<code>x</code>	Object created from tbl_uvregression
<code>variable</code>	Variable name of statistics to present
<code>level</code>	Level of the variable to display for categorical variables. Default is <code>NULL</code> , returning the top row in the table for the variable.
<code>pattern</code>	String indicating the statistics to return. Uses glue::glue formatting. Default is <code>"{estimate} ({conf.level }% CI {conf.low},{conf.high}; {p.value})"</code> . All columns from <code>x\$table_body</code> are available to print as well as the confidence level (<code>conf.level</code>). See below for details.
<code>estimate_fun</code>	function to style model coefficient estimates. Columns <code>'estimate'</code> , <code>'conf.low'</code> , and <code>'conf.high'</code> are formatted. Default is <code>x\$inputs\$estimate_fun</code>
<code>pvalue_fun</code>	function to style p-values and/or q-values. Default is <code>function(x) style_pvalue(x,prepend_p = TRUE)</code>
<code>...</code>	Not used

Value

A string reporting results from a gtsummary table

pattern argument

The following items are available to print. Use `print(x$table_body)` to print the table the estimates are extracted from.

- `{estimate}` coefficient estimate formatted with `'estimate_fun'`
- `{conf.low}` lower limit of confidence interval formatted with `'estimate_fun'`
- `{conf.high}` upper limit of confidence interval formatted with `'estimate_fun'`
- `{ci}` confidence interval formatted with `x$estimate_fun`
- `{p.value}` p-value formatted with `'pvalue_fun'`
- `{N}` number of observations in model
- `{label}` variable/variable level label

  tbl_uvregression(
    method = glm,
    method.args = list(family = binomial),
    y = response,
    exponentiate = TRUE
  )

inline_text(inline_text_ex1, variable = age)
inline_text(inline_text_ex1, variable = grade, level = "III")
```

modify_footnote

Update gtsummary table footnote

Description

Update gtsummary table footnote

Usage

```
modify_footnote(x, update, abbreviation = FALSE)
```

Arguments

x	a gtsummary object
update	list of formulas or a single formula specifying the footnote update. The LHS selects the columns from x\$table_body whose footnote will be updated, and the RHS is the new footnote. For example, update = stat_0 ~ "New footnote!" or update = starts_with("stat_") ~ "New footnote!". To delete the footnote, update the text to NA.
abbreviation	Logical indicating if an abbreviation is being updated. Abbreviation footnotes are handled differently. See examples below.

Value

gtsummary object

Example Output**See Also**

Other tbl_summary tools: [add_n\(\)](#), [add_overall\(\)](#), [add_p.tbl_summary\(\)](#), [add_q\(\)](#), [add_stat_label\(\)](#), [bold_italicize_labels_levels](#), [inline_text.tbl_summary\(\)](#), [inline_text.tbl_survfit\(\)](#), [modify_header\(\)](#), [modify_spanning_header\(\)](#), [tbl_merge\(\)](#), [tbl_stack\(\)](#), [tbl_summary\(\)](#)

Other tbl_regression tools: [add_global_p.tbl_regression\(\)](#), [add_nevent.tbl_regression\(\)](#), [add_q\(\)](#), [bold_italicize_labels_levels](#), [combine_terms\(\)](#), [inline_text.tbl_regression\(\)](#), [modify_header\(\)](#), [modify_spanning_header\(\)](#), [tbl_merge\(\)](#), [tbl_regression\(\)](#), [tbl_stack\(\)](#)

Other tbl_uvregression tools: [add_global_p.tbl_uvregression\(\)](#), [add_nevent.tbl_uvregression\(\)](#), [add_q\(\)](#), [bold_italicize_labels_levels](#), [inline_text.tbl_uvregression\(\)](#), [modify_header\(\)](#), [modify_spanning_header\(\)](#), [tbl_merge\(\)](#), [tbl_stack\(\)](#), [tbl_uvregression\(\)](#)

Examples

```
tbl_summary <-
  trial %>%
  select(trt, age, grade) %>%
  tbl_summary(by = trt)

# Example 1 -----
# update footnote
modify_footnote_ex1 <-
  tbl_summary %>%
  modify_footnote(
    update = starts_with("stat_") ~
      "median (IQR) for continuous variables; n (%) categorical variables"
  )

# Example 2 -----
# delete all footnotes - except abbreviations
# use `modify_footnote(everything() ~ NA, abbreviation = TRUE)` to delete abbrev. footnotes
modify_footnote_ex2 <-
  tbl_summary %>%
  modify_footnote(update = everything() ~ NA)
```

```
# Example 3 -----
# updating the footnote abbreviation for CI
modify_footnote_ex3 <-
  glm(response ~ age + grade, trial, family = binomial) %>%
  tbl_regression(exponentiate = TRUE) %>%
  modify_footnote(ci ~ "CI = Credible Interval", abbreviation = TRUE)
```

 modify_header

 Modify column headers in gtsummary tables

Description

Column labels can be modified to include calculated statistics; e.g. the N can be dynamically included by wrapping it in curly brackets (following [glue::glue](#) syntax).

Usage

```
modify_header(
  x,
  update = NULL,
  stat_by = NULL,
  text_interpret = c("md", "html"),
  ...
)
```

Arguments

x	gtsummary object, e.g. tbl_summary or tbl_regression
update	list of formulas or a single formula specifying the updated column label. Columns from x\$table_body may be selected.
stat_by	Used with tbl_summary(by=) objects with a by= argument. String specifying text to include above the summary statistics. The following fields are available for use in the headers: <ul style="list-style-type: none"> • {n} number of observations in each group, • {N} total number of observations, • {p} percentage in each group, • {level} the 'by' variable level, Syntax follows glue::glue() , e.g. stat_by = "**{level}**, N = {n} ({style_percent(p)}%)".
text_interpret	String indicates whether text will be interpreted with gt::md() or gt::html() . Must be "md" (default) or "html".
...	Specify a column and updated column label, e.g. modify_header(p.value = "Model P-values"). This is provided as an alternative to the update= argument. They accomplish the same goal of updating column headers.

Value

Function return the same class of gtsummary object supplied

Example Output

Author(s)

Daniel D. Sjoberg

Examples

```
# create summary table
tbl <- trial[c("age", "grade", "trt")] %>%
  tbl_summary(by = trt, missing = "no") %>%
  add_p()

# print `.$table_body` to show column names and update headers
tbl$table_body

# Example 1 -----
# updating column headers
modify_header_ex1 <-
  tbl %>%
  modify_header(
    update = list(
      label ~ "**Variable**",
      p.value ~ "**P**"
    )
  )

# Example 2 -----
# using `stat_by=` argument to update headers
modify_header_ex2 <-
  tbl %>%
  modify_header(
    stat_by = "**{level}**", N = {n} ({style_percent(p)})"
  )
```

`modify_spanning_header`

Update gtsummary table spanning header

Description

Update gtsummary table spanning header

Usage

```
modify_spanning_header(x, update)
```

Arguments

x	a gtsummary object
update	list of formulas or a single formula specifying the update. The LHS selects the variables whose spanning header will be updated, and the RHS is the new spanning header. For example, <code>update = starts_with("stat_") ~ "New spanning header!"</code> . Columns from <code>x\$table_body</code> may be selected. To remove all spanning headers, use <code>update = everything() ~ NA</code> .

Value

gtsummary object

Example Output**See Also**

Other `tbl_summary` tools: `add_n()`, `add_overall()`, `add_p.tbl_summary()`, `add_q()`, `add_stat_label()`, `bold_italicize_labels_levels`, `inline_text.tbl_summary()`, `inline_text.tbl_survfit()`, `modify_footnote()`, `modify_header()`, `tbl_merge()`, `tbl_stack()`, `tbl_summary()`

Other `tbl_regression` tools: `add_global_p.tbl_regression()`, `add_nevent.tbl_regression()`, `add_q()`, `bold_italicize_labels_levels`, `combine_terms()`, `inline_text.tbl_regression()`, `modify_footnote()`, `modify_header()`, `tbl_merge()`, `tbl_regression()`, `tbl_stack()`

Other `tbl_uvregression` tools: `add_global_p.tbl_uvregression()`, `add_nevent.tbl_uvregression()`, `add_q()`, `bold_italicize_labels_levels`, `inline_text.tbl_uvregression()`, `modify_footnote()`, `modify_header()`, `tbl_merge()`, `tbl_stack()`, `tbl_uvregression()`

Examples

```
# Example 1 -----
# add header above summary statistics
spanning_header_ex1 <-
  trial %>%
  select(trt, age, grade) %>%
  tbl_summary(by = trt) %>%
  modify_spanning_header(starts_with("stat_") ~ "***Randomization Assignment**")
```

print_gtsummary

print and knit_print methods for gtsummary objects

Description

print and knit_print methods for gtsummary objects

Usage

```
## S3 method for class 'gtsummary'
print(x, print_engine = NULL, ...)

## S3 method for class 'gtsummary'
knit_print(x, ...)
```

Arguments

x	An object created using gtsummary functions
print_engine	String indicating the print method. Must be one of "gt", "kable", "kable_extra", "flextable", "tibble"
...	Not used

Author(s)

Daniel D. Sjoberg

See Also

[tbl_summary](#) [tbl_regression](#) [tbl_uvregression](#) [tbl_merge](#) [tbl_stack](#)

select_helpers

Select helper functions

Description

Set of functions to supplement the tidyselect set of functions for selecting columns of data frames. `all_continuous()`, `all_categorical()`, and `all_dichotomous()` may only be used with `tbl_summary()`, where each variable has been classified into one of these three groups. All other helpers are available throughout the package.

Usage

```
all_continuous()

all_categorical(dichotomous = TRUE)

all_dichotomous()

all_numeric()

all_character()

all_integer()

all_double()

all_logical()

all_factor()
```

Arguments

dichotomous Logical indicating whether to include dichotomous variables. Default is TRUE

Value

A character vector of column names selected

Examples

```
select_ex1 <-
  trial %>%
  select(age, response, grade) %>%
  tbl_summary(
    statistic = all_continuous() ~ "{mean} ({sd})",
    type = all_dichotomous() ~ "categorical"
  )
```

set_gtsummary_theme	<i>Set a gtsummary theme</i>
---------------------	------------------------------

Description

Experimental Use this function to set preferences for the display of gtsummary tables. The default formatting and styling throughout the gtsummary package are taken from the published reporting guidelines of the top four urology journals: European Urology, The Journal of Urology, Urology and the British Journal of Urology International. Use this function to change the default reporting style to match another journal, or your own personal style.

Usage

```
set_gtsummary_theme(x)

reset_gtsummary_theme()
```

Arguments

x A gtsummary theme function, e.g. theme_gtsummary_journal(), or a named list defining a gtsummary theme. See details below.

Themes

Review the [themes vignette](#) to create your own themes.

Example Output**See Also**

Available [gtsummary themes](#)

Examples

```
# Setting JAMA theme for gtsummary
set_gtsummary_theme(theme_gtsummary_journal("jama"))
# Themes can be combined by including more than one
set_gtsummary_theme(theme_gtsummary_compact())

set_gtsummary_theme_ex1 <-
  trial %>%
  dplyr::select(age, grade, trt) %>%
  tbl_summary(by = trt) %>%
  add_stat_label() %>%
  as_gt()

# reset gtsummary theme
reset_gtsummary_theme()
```

sort_p	<i>Sort variables in table by ascending p-values</i>
--------	--

Description

Sort tables created by gtsummary by p-values

Usage

```
sort_p(x, q = FALSE)
```

Arguments

x	An object created using gtsummary functions
q	Logical argument. When TRUE will sort by the q-value column

Example Output**Author(s)**

Karissa Whiting

Examples

```
# Example 1 -----
sort_p_ex1 <-
  trial[c("age", "grade", "response", "trt")] %>%
  tbl_summary(by = trt) %>%
  add_p() %>%
  sort_p()

# Example 2 -----
sort_p_ex2 <-
  glm(response ~ trt + grade, trial, family = binomial(link = "logit")) %>%
  tbl_regression(exponentiate = TRUE) %>%
  sort_p()
```

style_percent	<i>Style percentages to be displayed in tables or text</i>
---------------	--

Description

Style percentages to be displayed in tables or text

Usage

```
style_percent(x, symbol = FALSE)
```

Arguments

x	numeric vector of percentages
symbol	Logical indicator to include percent symbol in output. Default is FALSE.

Value

A character vector of styled percentages

Author(s)

Daniel D. Sjoberg

See Also

See Table Gallery [vignette](#) for example
 Other style tools: [style_pvalue\(\)](#), [style_ratio\(\)](#), [style_sigfig\(\)](#)

Examples

```
percent_vals <- c(-1, 0, 0.0001, 0.005, 0.01, 0.10, 0.45356, 0.99, 1.45)
style_percent(percent_vals)
style_percent(percent_vals, symbol = TRUE)
```

style_pvalue	<i>Style p-values to be displayed in tables or text</i>
--------------	---

Description

Style p-values to be displayed in tables or text

Usage

```
style_pvalue(x, digits = 1, prepend_p = FALSE)
```

Arguments

x	Numeric vector of p-values.
digits	Number of digits large p-values are rounded. Must be 1 or 2. Default is 1.
prepend_p	Logical. Should 'p=' be prepended to formatted p-value. Default is FALSE

Value

A character vector of styled p-values

Author(s)

Daniel D. Sjoberg

See Also

See `tbl_summary` [vignette](#) for examples

Other style tools: [style_percent\(\)](#), [style_ratio\(\)](#), [style_sigfig\(\)](#)

Examples

```
pvals <- c(
  1.5, 1, 0.999, 0.5, 0.25, 0.2, 0.197, 0.12, 0.10, 0.0999, 0.06,
  0.03, 0.002, 0.001, 0.00099, 0.0002, 0.00002, -1
)
style_pvalue(pvals)
style_pvalue(pvals, digits = 2, prepend_p = TRUE)
```

style_ratio

Implement significant figure-like rounding for ratios

Description

When reporting ratios, such as relative risk or an odds ratio, we'll often want the rounding to be similar on each side of the number 1. For example, if we report an odds ratio of 0.95 with a confidence interval of 0.70 to 1.24, we would want to round to two decimal places for all values. In other words, 2 significant figures for numbers less than 1 and 3 significant figures 1 and larger. `style_ratio()` performs significant figure-like rounding in this manner.

Usage

```
style_ratio(x, digits = 2)
```

Arguments

<code>x</code>	Numeric vector
<code>digits</code>	Integer specifying the number of significant digits to display for numbers below 1. Numbers larger than 1 will be <code>digits + 1</code> . Default is <code>digits = 2</code> .

Value

A character vector of styled ratios

Author(s)

Daniel D. Sjoberg

See Also

Other style tools: [style_percent\(\)](#), [style_pvalue\(\)](#), [style_sigfig\(\)](#)

Examples

```
c(
  0.123, 0.9, 1.1234, 12.345, 101.234, -0.123,
  -0.9, -1.1234, -12.345, -101.234
) %>%
  style_ratio()
```

style_sigfig	<i>Implement significant figure-like rounding</i>
--------------	---

Description

Converts a numeric argument into a string that has been rounded to a significant figure-like number. Scientific notation output is avoided, however, and additional significant figures may be displayed for large numbers. For example, if the number of significant digits requested is 2, 123 will be displayed (rather than 120 or 1.2×10^2).

Usage

```
style_sigfig(x, digits = 2)
```

Arguments

x	Numeric vector
digits	Integer specifying the minimum number of significant digits to display

Details

If 2 sig figs are input, the number is rounded to 2 decimal places when $\text{abs}(x) < 1$, 1 decimal place when $\text{abs}(x) \geq 1$ & $\text{abs}(x) < 10$, and to the nearest integer when $\text{abs}(x) \geq 10$.

Value

A character vector of styled numbers

Author(s)

Daniel D. Sjoberg

See Also

Other style tools: [style_percent\(\)](#), [style_pvalue\(\)](#), [style_ratio\(\)](#)

Examples

```
c(0.123, 0.9, 1.1234, 12.345, -0.123, -0.9, -1.1234, -12.345, NA, -0.001) %>%
  style_sigfig()
```

tbl_cross

*Create a cross table of summary statistics***Description**

Experimental The function creates a cross table of two categorical variables.

Usage

```
tbl_cross(
  data,
  row = NULL,
  col = NULL,
  label = NULL,
  statistic = NULL,
  percent = c("none", "column", "row", "cell"),
  margin = c("column", "row"),
  missing = c("ifany", "always", "no"),
  missing_text = "Unknown",
  margin_text = "Total"
)
```

Arguments

data	A data frame
row	A column name in data to be used for columns of cross table.
col	A column name in data to be used for rows of cross table.
label	List of formulas specifying variables labels, e.g. <code>list(age ~ "Age, yrs", stage ~ "Path T Stage")</code> . If a variable's label is not specified here, the label attribute (<code>attr(data\$age, "label")</code>) is used. If attribute label is NULL, the variable name will be used.
statistic	A string with the statistic name in curly brackets to be replaced with the numeric statistic (see <code>glue::glue</code>). The default is <code>{n}</code> . If percent argument is "column", "row", or "cell", default is <code>{n} ({p}%)</code> .
percent	Indicates the type of percentage to return. Must be one of "none", "column", "row", or "cell". Default is "cell" when <code>{N}</code> or <code>{p}</code> is used in statistic.
margin	Indicates which margins to add to the table. Default is <code>c("row", "column")</code>
missing	Indicates whether to include counts of NA values in the table. Allowed values are "no" (never display NA values), "ifany" (only display if any NA values), and "always" (includes NA count row for all variables). Default is "ifany".
missing_text	String to display for count of missing observations. Default is "Unknown".
margin_text	Text to display for margin totals. Default is "Total"

Value

A `tbl_cross` object

Example Output

Author(s)

Karissa Whiting, Daniel D. Sjoberg

See Also

Other tbl_cross tools: [add_p.tbl_cross\(\)](#), [inline_text.tbl_cross\(\)](#)

Examples

```
# Example 1 -----
tbl_cross_ex1 <-
  trial %>%
  tbl_cross(row = trt, col = response)

# Example 2 -----
tbl_cross_ex2 <-
  trial %>%
  tbl_cross(row = stage, col = trt, percent = "cell") %>%
  add_p()
```

tbl_merge	<i>Merge two or more gtsummary objects</i>
-----------	--

Description

Merges two or more tbl_regression, tbl_uvregression, tbl_stack, or tbl_summary objects and adds appropriate spanning headers.

Usage

```
tbl_merge(tbls, tab_spanner = NULL)
```

Arguments

- tbls List of gtsummary objects to merge
- tab_spanner Character vector specifying the spanning headers. Must be the same length as tbls. The strings are interpreted with `gt::md`. Must be same length as tbls argument

Value

A tbl_merge object

Example Output

Author(s)

Daniel D. Sjoberg

See Also[tbl_stack](#)

    trial[c("ttdeath", "death", "age", "grade", "response")],
    method = coxph,
    y = Surv(ttdeath, death),
    exponentiate = TRUE,
    hide_n = TRUE
  )

tbl_merge_ex2 <-
  tbl_merge(tbls = list(t3, t4)) %>%
  modify_spanning_header(everything() ~ NA_character_)
```

tbl_regression	<i>Display regression model results in table</i>
----------------	--

Description

This function takes a regression model object and returns a formatted table that is publication-ready. The function is highly customizable allowing the user to obtain a bespoke summary table of the regression model results. Review the [tbl_regression vignette](#) for detailed examples.

Usage

```
tbl_regression(
  x,
  label = NULL,
  exponentiate = FALSE,
  include = everything(),
  show_single_row = NULL,
  conf.level = NULL,
  intercept = FALSE,
  estimate_fun = NULL,
  pvalue_fun = NULL,
  tidy_fun = NULL,
  show_yn = NULL,
  exclude = NULL
)
```

Arguments

<code>x</code>	Regression model object
<code>label</code>	List of formulas specifying variables labels, e.g. <code>list(age ~ "Age, yrs", stage ~ "Path T Stage")</code>
<code>exponentiate</code>	Logical indicating whether to exponentiate the coefficient estimates. Default is <code>FALSE</code> .
<code>include</code>	Variables to include in output. Input may be a vector of quoted variable names, unquoted variable names, or <code>tidyselect</code> select helper functions. Default is <code>everything()</code> .
<code>show_single_row</code>	By default categorical variables are printed on multiple rows. If a variable is dichotomous (e.g. Yes/No) and you wish to print the regression coefficient on a single row, include the variable name(s) here—quoted and unquoted variable name accepted.
<code>conf.level</code>	Must be strictly greater than 0 and less than 1. Defaults to 0.95, which corresponds to a 95 percent confidence interval.
<code>intercept</code>	Logical argument indicating whether to include the intercept in the output. Default is <code>FALSE</code>
<code>estimate_fun</code>	Function to round and format coefficient estimates. Default is style_sigfig when the coefficients are not transformed, and style_ratio when the coefficients have been exponentiated.

pvalue_fun	Function to round and format p-values. Default is style_pvalue . The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. <code>pvalue_fun = function(x) style_pvalue(x, digits = 2)</code> or equivalently, <code>purrr::partial(style_pvalue, digits = 2)</code>).
tidy_fun	Option to specify a particular tidier function if the model is not a vetted model or you need to implement a custom method. Default is NULL
show_ynsno	DEPRECATED
exclude	DEPRECATED

Value

A `tbl_regression` object

Setting Defaults

If you prefer to consistently use a different function to format p-values or estimates, you can set options in the script or in the user- or project-level startup file, `'.Rprofile'`. The default confidence level can also be set.

- `options(gtsummary.pvalue_fun = new_function)`
- `options(gtsummary.tbl_regression.estimate_fun = new_function)`
- `options(gtsummary.conf.level = 0.90)`

Note

The N reported in the output is the number of observations in the data frame `model.frame(x)`. Depending on the model input, this N may represent different quantities. In most cases, it is the number of people or units in your model. Here are some common exceptions.

1. Survival regression models including time dependent covariates.
2. Random- or mixed-effects regression models with clustered data.
3. GEE regression models with clustered data.

This list is not exhaustive, and care should be taken for each number reported.

Example Output

Author(s)

Daniel D. Sjoberg

  tbl_regression(exponentiate = TRUE)
```

tbl_stack

*Stacks two or more gtsummary objects***Description**

Assists in patching together more complex tables. `tbl_stack()` appends two or more `tbl_regression`, `tbl_summary`, or `tbl_merge` objects. `gt` attributes from the first regression object are utilized for output table.

Usage

```
tbl_stack(tbls, group_header = NULL)
```

Arguments

<code>tbls</code>	List of <code>gtsummary</code> objects
<code>group_header</code>	Character vector with table headers where length matches the length of <code>tbls</code>

Value

A `tbl_stack` object

Example Output**Author(s)**

Daniel D. Sjoberg

Examples

```
# Example 1 -----
# stacking two tbl_regression objects
t1 <-
  glm(response ~ trt, trial, family = binomial) %>%
  tbl_regression(
    exponentiate = TRUE,
    label = list(trt ~ "Treatment (unadjusted)")
  )

t2 <-
  glm(response ~ trt + grade + stage + marker, trial, family = binomial) %>%
  tbl_regression(
    include = "trt",
    exponentiate = TRUE,
    label = list(trt ~ "Treatment (adjusted)")
  )

tbl_stack_ex1 <- tbl_stack(list(t1, t2))

# Example 2 -----
# stacking two tbl_merge objects
library(survival)
t3 <-
  coxph(Surv(ttdeath, death) ~ trt, trial) %>%
  tbl_regression(
    exponentiate = TRUE,
    label = list(trt ~ "Treatment (unadjusted)")
  )

t4 <-
  coxph(Surv(ttdeath, death) ~ trt + grade + stage + marker, trial) %>%
  tbl_regression(
    include = "trt",
    exponentiate = TRUE,
    label = list(trt ~ "Treatment (adjusted)")
  )

# first merging, then stacking
row1 <- tbl_merge(list(t1, t3), tab_spanner = c("Tumor Response", "Death"))
row2 <- tbl_merge(list(t2, t4))
```

```
tbl_stack_ex2 <-
  tbl_stack(list(row1, row2), group_header = c("Unadjusted Analysis", "Adjusted Analysis"))
```

tbl_summary

Create a table of summary statistics

Description

The `tbl_summary` function calculates descriptive statistics for continuous, categorical, and dichotomous variables. Review the [tbl_summary vignette](#) for detailed examples.

Usage

```
tbl_summary(
  data,
  by = NULL,
  label = NULL,
  statistic = NULL,
  digits = NULL,
  type = NULL,
  value = NULL,
  missing = NULL,
  missing_text = NULL,
  sort = NULL,
  percent = NULL,
  include = everything(),
  group = NULL
)
```

Arguments

<code>data</code>	A data frame
<code>by</code>	A column name (quoted or unquoted) in <code>data</code> . Summary statistics will be calculated separately for each level of the <code>by</code> variable (e.g. <code>by = trt</code>). If <code>NULL</code> , summary statistics are calculated using all observations.
<code>label</code>	List of formulas specifying variables labels, e.g. <code>list(age ~ "Age, yrs", stage ~ "Path T Stage")</code> . If a variable's label is not specified here, the label attribute (<code>attr(data\$age, "label")</code>) is used. If attribute label is <code>NULL</code> , the variable name will be used.
<code>statistic</code>	List of formulas specifying types of summary statistics to display for each variable. The default is <code>list(all_continuous() ~ "{median} ({p25},{p75})", all_categorical() ~ "{n} ({p}%)")</code> . See below for details.
<code>digits</code>	List of formulas specifying the number of decimal places to round continuous summary statistics. If not specified, <code>tbl_summary</code> guesses an appropriate number of decimals to round statistics. When multiple statistics are displayed for a single variable, supply a vector rather than an integer. For example, if the statistic being calculated is <code>"{mean} ({sd})"</code> and you want the mean rounded to 1 decimal place, and the SD to 2 use <code>digits = list(age ~ c(1,2))</code> .

type	List of formulas specifying variable types. Accepted values are <code>c("continuous", "categorical", "dichotomous")</code> . e.g. <code>type = list(age ~ "continuous", female ~ "dichotomous")</code> . If type not specified for a variable, the function will default to an appropriate summary type. See below for details.
value	List of formulas specifying the value to display for dichotomous variables. See below for details.
missing	Indicates whether to include counts of NA values in the table. Allowed values are "no" (never display NA values), "ifany" (only display if any NA values), and "always" (includes NA count row for all variables). Default is "ifany".
missing_text	String to display for count of missing observations. Default is "Unknown".
sort	List of formulas specifying the type of sorting to perform for categorical data. Options are frequency where results are sorted in descending order of frequency and alphanumeric, e.g. <code>sort = list(everything() ~ "frequency")</code>
percent	Indicates the type of percentage to return. Must be one of "column", "row", or "cell". Default is "column".
include	variables to include in the summary table. Default is <code>everything()</code>
group	DEPRECATED. Migrated to add_p

Value

A `tbl_summary` object

select helpers

Select helpers from the `\tidyselect\` package and `\gtsummary\` package are available to modify default behavior for groups of variables. For example, by default continuous variables are reported with the median and IQR. To change all continuous variables to mean and standard deviation use `statistic = list(all_continuous() ~ "{mean} ({sd})")`.

All columns with class logical are displayed as dichotomous variables showing the proportion of events that are TRUE on a single row. To show both rows (i.e. a row for TRUE and a row for FALSE) use `type = list(all_logical() ~ "categorical")`.

The select helpers are available for use in any argument that accepts a list of formulas (e.g. `statistic`, `type`, `digits`, `value`, `sort`, etc.)

statistic argument

The `statistic` argument specifies the statistics presented in the table. The input is a list of formulas that specify the statistics to report. For example, `statistic = list(age ~ "{mean} ({sd})")` would report the mean and standard deviation for age; `statistic = list(all_continuous() ~ "{mean} ({sd})")` would report the mean and standard deviation for all continuous variables. A statistic name that appears between curly brackets will be replaced with the numeric statistic (see [glue::glue](#)).

For categorical variables the following statistics are available to display.

- `{n}` frequency
- `{N}` denominator, or cohort size
- `{p}` formatted percentage

For continuous variables the following statistics are available to display.

- `{median}` median

- {mean} mean
- {sd} standard deviation
- {var} variance
- {min} minimum
- {max} maximum
- {p##} any integer percentile, where ## is an integer from 0 to 100
- {foo} any function of the form foo(x) is accepted where x is a numeric vector

For both categorical and continuous variables, statistics on the number of missing and non-missing observations and their proportions are available to display.

- {N_obs} total number of observations
- {N_miss} number of missing observations
- {N_nonmiss} number of non-missing observations
- {p_miss} percentage of observations missing
- {p_nonmiss} percentage of observations not missing

Note that for categorical variables, {N_obs}, {N_miss} and {N_nonmiss} refer to the total number, number missing and number non missing observations in the denominator, not at each level of the categorical variable.

type argument

tbl_summary displays summary statistics for three types of data: continuous, categorical, and dichotomous. If the type is not specified, tbl_summary will do its best to guess the type. Dichotomous variables are categorical variables that are displayed on a single row in the output table, rather than one row per level of the variable. Variables coded as TRUE/FALSE, 0/1, or yes/no are assumed to be dichotomous, and the TRUE, 1, and yes rows are displayed. Otherwise, the value to display must be specified in the value argument, e.g. value = list(varname ~ "level to show")

Example Output

Author(s)

Daniel D. Sjoberg

See `tbl_summary` [vignette](#) for detailed tutorial

See [table gallery](#) for additional examples

Other `tbl_summary` tools: `add_n()`, `add_overall()`, `add_p.tbl_summary()`, `add_q()`, `add_stat_label()`, `bold_italicize_labels_levels`, `inline_text.tbl_summary()`, `inline_text.tbl_survfit()`, `modify_footnote()`, `modify_header()`, `modify_spanning_header()`, `tbl_merge()`, `tbl_stack()`

Examples

```
# Example 1 -----
tbl_summary_ex1 <-
  trial[c("age", "grade", "response")] %>%
  tbl_summary()

# Example 2 -----
tbl_summary_ex2 <-
  trial[c("age", "grade", "response", "trt")] %>%
  tbl_summary(
    by = trt,
    label = list(age ~ "Patient Age"),
    statistic = list(all_continuous() ~ "{mean} ({sd})"),
    digits = list(age ~ c(0, 1))
  )

# Example 3 -----
# for convenience, you can also pass named lists to any arguments
# that accept formulas (e.g label, digits, etc.)
tbl_summary_ex3 <-
  trial[c("age", "trt")] %>%
  tbl_summary(
    by = trt,
    label = list(age = "Patient Age")
  )
```

tbl_survfit

Creates table of survival probabilities

Description

Experimental Function takes a survfit object as an argument, and provides a formatted summary table of the results

Usage

```
tbl_survfit(
  x,
  times = NULL,
  probs = NULL,
  statistic = "{estimate} ({conf.low}, {conf.high})",
  label = NULL,
  label_header = NULL,
  estimate_fun = NULL,
  missing = "--",
  conf.level = 0.95,
  failure = FALSE
)
```

Arguments

x survfit object. Object may have no stratification (e.g. survfit(Surv(ttdeath, death) ~ 1, trial)), or a single stratifying variable (e.g. survfit(Surv(ttdeath, death) ~ trt, trial))

times	numeric vector of times for which to return survival probabilities.
probs	numeric vector of probabilities with values in (0,1) specifying the survival quantiles to return
statistic	string defining the statistics to present in the table. Default is "{estimate} ({conf.low},{conf.high})"
label	string specifying variable or overall label. Default is stratifying variable name or "Overall" when no stratifying variable present
label_header	string specifying column labels above statistics. Default is "{prob} Percentile" for survival percentiles, and "Time {time}" for n-year survival estimates
estimate_fun	function to format the Kaplan-Meier estimates. Default is style_percent for survival probabilities and style_sigfig for survival times
missing	text to fill when estimate is not estimable. Default is "--"
conf.level	Confidence level for confidence intervals. Default is 0.95
failure	Calculate failure probabilities rather than survival probabilities. Default is FALSE. Does not apply to survival quantile requests

Example Output

Author(s)

Daniel D. Sjoberg

Examples

```
library(survival)
fit1 <- survfit(Surv(ttdeath, death) ~ trt, trial)
fit2 <- survfit(Surv(ttdeath, death) ~ 1, trial)

# Example 1 -----
tbl_survfit_ex1 <- tbl_survfit(
  fit1,
  times = c(12, 24),
  label = "Treatment",
  label_header = "**{time} Month**"
)

# Example 2 -----
tbl_survfit_ex2 <- tbl_survfit(
  fit2,
  probs = 0.5,
  label_header = "**Median Survival**"
)
```

tbl_uvregression *Display univariate regression model results in table*

Description

This function estimates univariate regression models and returns them in a publication-ready table. It can create univariate regression models holding either a covariate or outcome constant.

For models holding outcome constant, the function takes as arguments a data frame, the type of regression model, and the outcome variable `y`. Each column in the data frame is regressed on the specified outcome. The `tbl_uvregression` function arguments are similar to the [tbl_regression](#) arguments. Review the [tbl_uvregression vignette](#) for detailed examples.

You may alternatively hold a single covariate constant. For this, pass a data frame, the type of regression model, and a single covariate in the `x` argument. Each column of the data frame will serve as the outcome in a univariate regression model. Take care using the `x` argument that each of the columns in the data frame are appropriate for the same type of model, e.g. they are all continuous variables appropriate for [lm](#), or dichotomous variables appropriate for logistic regression with [glm](#).

Usage

```
tbl_uvregression(
  data,
  method,
  y = NULL,
  x = NULL,
  method.args = NULL,
  formula = "{y} ~ {x}",
  exponentiate = FALSE,
  label = NULL,
  include = everything(),
  exclude = NULL,
  hide_n = FALSE,
  show_single_row = NULL,
  conf.level = NULL,
  estimate_fun = NULL,
  pvalue_fun = NULL,
  show_yesno = NULL,
  tidy_fun = NULL
)
```

Arguments

<code>data</code>	Data frame to be used in univariate regression modeling. Data frame includes the outcome variable(s) and the independent variables.
<code>method</code>	Regression method (e.g. lm , glm , survival::coxph , and more).
<code>y</code>	Model outcome (e.g. <code>y = recurrence</code> or <code>y = Surv(time, recur)</code>). All other column in data will be regressed on <code>y</code> . Specify one and only one of <code>y</code> or <code>x</code>
<code>x</code>	Model covariate (e.g. <code>x = trt</code>). All other columns in data will serve as the outcome in a regression model with <code>x</code> as a covariate. Output table is best when <code>x</code> is a continuous or dichotomous variable displayed on a single row. Specify one and only one of <code>y</code> or <code>x</code>

method.args	List of additional arguments passed on to the regression function defined by method.
formula	String of the model formula. Uses glue::glue syntax. Default is "{y} ~ {x}", where {y} is the dependent variable, and {x} represents a single covariate. For a random intercept model, the formula may be formula = "{y} ~ {x} + (1 gear)".
exponentiate	Logical indicating whether to exponentiate the coefficient estimates. Default is FALSE.
label	List of formulas specifying variables labels, e.g. list(age ~ "Age, yrs", stage ~ "Path T Stage")
include	Variables to include in output. Input may be a vector of quoted variable names, unquoted variable names, or tidyselect select helper functions. Default is everything().
exclude	DEPRECATED
hide_n	Hide N column. Default is FALSE
show_single_row	By default categorical variables are printed on multiple rows. If a variable is dichotomous (e.g. Yes/No) and you wish to print the regression coefficient on a single row, include the variable name(s) here—quoted and unquoted variable name accepted.
conf.level	Must be strictly greater than 0 and less than 1. Defaults to 0.95, which corresponds to a 95 percent confidence interval.
estimate_fun	Function to round and format coefficient estimates. Default is style_sigfig when the coefficients are not transformed, and style_ratio when the coefficients have been exponentiated.
pvalue_fun	Function to round and format p-values. Default is style_pvalue . The function must have a numeric vector input (the numeric, exact p-value), and return a string that is the rounded/formatted p-value (e.g. pvalue_fun = function(x) style_pvalue(x, digits = 2) or equivalently, purrr::partial(style_pvalue, digits = 2)).
show_yesno	DEPRECATED
tidy_fun	Option to specify a particular tidier function if the model is not a vetted model or you need to implement a custom method. Default is NULL

Value

A tbl_uvregression object

Example Output

Setting Defaults

If you prefer to consistently use a different function to format p-values or estimates, you can set options in the script or in the user- or project-level startup file, '.Rprofile'. The default confidence level can also be set.

- options(gtsummary.pvalue_fun = new_function)
- options(gtsummary.tbl_regression.estimate_fun = new_function)
- options(gtsummary.conf.level = 0.90)

Note

The N reported in the output is the number of observations in the data frame `model.frame(x)`. Depending on the model input, this N may represent different quantities. In most cases, it is the number of people or units in your model. Here are some common exceptions.

1. Survival regression models including time dependent covariates.
2. Random- or mixed-effects regression models with clustered data.
3. GEE regression models with clustered data.

This list is not exhaustive, and care should be taken for each number reported.

See `tbl_regression` [vignette](#) for detailed examples

Other `tbl_uvregression` tools: `add_global_p.tbl_uvregression()`, `add_nevent.tbl_uvregression()`, `add_q()`, `bold_italicize_labels_levels`, `inline_text.tbl_uvregression()`, `modify_footnote()`, `modify_header()`, `modify_spanning_header()`, `tbl_merge()`, `tbl_stack()`

Examples

```
# Example 1 -----
tbl_uv_ex1 <-
  tbl_uvregression(
    trial[c("response", "age", "grade")],
    method = glm,
    y = response,
    method.args = list(family = binomial),
    exponentiate = TRUE
  )

# Example 2 -----
# rounding pvalues to 2 decimal places
library(survival)
tbl_uv_ex2 <-
  tbl_uvregression(
    trial[c("ttdeath", "death", "age", "grade", "response")],
    method = coxph,
    y = Surv(ttdeath, death),
    exponentiate = TRUE,
    pvalue_fun = function(x) style_pvalue(x, digits = 2)
  )
```

theme_gtsummary	<i>Available gtsummary themes</i>
-----------------	-----------------------------------

Description

Experimental The following themes are available to use within the gtsummary package. Use the `set_gtsummary_theme()` function to set a theme.

Usage

```
theme_gtsummary_journal(journal = "jama")

theme_gtsummary_compact()

theme_gtsummary_printer(
  print_engine = c("gt", "kable", "kable_extra", "flextable", "tibble")
)
```

Arguments

journal	String indicating the journal theme to follow. <ul style="list-style-type: none"> "jama" Journal of the American Medical Association
print_engine	String indicating the print engine. Default is "gt"

Themes

- `theme_gtsummary_journal(journal=)`
 - `journal = "jama"`
 - * sets theme to align with the JAMA reporting guidelines
 - * large p-values are rounded to two decimal places
 - * in `tbl_summary()` the IQR is separated with a dash, rather than comma
 - * in `tbl_summary()` the percent symbol is not printed next to percentages
- `theme_gtsummary_compact()`
 - tables printed with gt or flextable will be compact with smaller font size and reduced cell padding
- `theme_gtsummary_printer(print_engine=)`
 - "gt" sets the gt package as the default print engine
 - "kable" sets the `knitr::kable()` function as the default print engine
 - "flextable" sets the flextable package as the default print engine
 - "kable_extra" sets the kableExtra package as the default print engine

Use `reset_gtsummary_theme()` to restore the default settings

Review the [themes vignette](#) to create your own themes.

Example Output
