

Package ‘FCPS’

June 26, 2020

Type Package

Title Fundamental Clustering Problems Suite

Version 1.2.3

Date 2020-06-26

Maintainer Michael Thrun <m.thrun@gmx.net>

Description Many conventional clustering algorithms are provided in this package with consistent input and output, which enables the user to try out algorithms swiftly. Additionally, 26 statistical approaches for the estimation of the number of clusters as well as the the mirrored density plot (MD-plot) of clusterability are implemented. Moreover, the fundamental clustering problems suite (FCPS) offers a variety of clustering challenges any algorithm should handle when facing real world data, see Thrun, M.C., Ultsch A.: ``Clustering Benchmark Datasets Exploiting the Fundamental Clustering Problems" (2020), Data in Brief, <DOI:10.1016/j.dib.2020.105501>.

Description

Many conventional clustering algorithms are provided in this package with consistent input and output, which enables the user to try out algorithms swiftly. Additionally, 26 statistical approaches for the estimation of the number of clusters as well as the mirrored density plot (MD-plot) of clusterability are implemented. Moreover, the fundamental clustering problems suite (FCPS) offers a variety of clustering challenges any algorithm should handle when facing real world data, see Thrun, M.C., Ultsch A.: "Clustering Benchmark Datasets Exploiting the Fundamental Clustering Problems" (2020), Data in Brief, <DOI:10.1016/j.dib.2020.105501>.

The 'Fundamental Clustering Problems Suite' (FCPS) originally offered a variety of clustering problems any algorithm shall be able to handle when facing real world data. Nine of the here presented artificial datasets were priorly named FCPS in Ultsch, A.: "Clustering with SOM: U*C", In Workshop on Self-Organizing Maps, 2005. FCPS often served in the paper as an elementary benchmark for clustering algorithms. The FCPS package extends datasets and provides a standardized and easy access to many clustering algorithms.

Details

FCPS datasets consists of data sets with known a priori classification to be reproduced by the algorithms. All data sets are intentionally created to be simple and might be visualized in two or three dimensions. Each data sets represents a certain problem that is solved by known clustering algorithms with varying success. This is done in order to reveal benefits and shortcomings of algorithms in question. Standard clustering methods, e.g. single-linkage, ward and k-means, are not able to solve all FCPS problems satisfactorily. "Lsun3D and each of the nine artificial data sets of "Fundamental Clustering Problems Suite" (FCPS) were defined separately for a specific clustering problem as cited (in [Thrun/Ultsch, 2020]). The original sample size defined in the respective first publication mentioning the data was used in [Thrun/Ultsch, 2020], but using the R function "ClusterChallenge" (...) any sample size can be drawn for all artificial data sets. [Thrun/Ultsch, 2020]

Index: This package was not yet installed at build time.

ADPclustering	<i>(Adaptive) Density Peak Clustering algorithm using automatic parameter selection</i>
---------------	---

Description

The algorithm was introduced in [Rodriguez/Laio, 2014] and here implemented by [Wang/Xu, 2017]. The algorithm is adaptive in the sense that only `ClusterNo` has to be set instead of the parameters of [Rodriguez/Laio, 2014] implemented in [ADPclustering](#).

Usage

```
ADPclustering(Data,ClusterNo=NULL,PlotIt=FALSE,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	Optional, either: A number k which defines k different Clusters to be build by the algorithm, or a range of ClusterNo to let the algorithm choose from.
PlotIt	default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in C1s
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

The ADP algorithm decides the k number of clusters. This is contrary to the other version of the algorithm from another package which can be called with [DensityPeakClustering](#).

Value

List of	
C1s	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

Examples

```
data('Hepta')
out=ADPclustering(Hepta$Data,PlotIt=FALSE)
```

AgglomerativeNestingClustering
AGNES clustering

Description

Agglomerative hierarchical clustering (AGNES)

Usage

```
AgglomerativeNestingClustering(DataOrDistances, ClusterNo,
PlotIt = FALSE, Standardization = TRUE, ...)
```

Arguments

DataOrDistances	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases or d-dimensional data points. Every case has d attributes, variables or features. Alternatively, symmetric [1:n,1:n] distance matrix
ClusterNo	A number k which defines k different clusters to be built by the algorithm. if ClusterNo=0, the dendrogram is generated instead of a clustering to estimate the numbers of clusters.
PlotIt	Default: FALSE if codeClusterNo!=0, If TRUE or codeClusterNo=0 plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls

Standardization

DataOrDistances is standardized before calculating the dissimilarities. Measurements are standardized for each variable (column), by subtracting the variable's mean value and dividing by the variable's mean absolute deviation. If DataOrDistances is already a distance matrix, then this argument will be ignored.

...

Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Value

List of

Cls [1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.

Dendrogram Dendrogram of hierarchical clustering algorithm

Object Object defined by clustering algorithm as the other output of this algorithm

APclustering

Affinity Propagation Clustering

Description

Affinity propagation clustering published by [Frey/Dueck, 2007] and implemented by [Bodenhofer et al., 2011].

Usage

```
APclustering(DataOrDistances,
             InputPreference=NA, ExemplarPreferences=NA,
             DistanceMethod="euclidean",
             Seed=7568, PlotIt=FALSE, Data, ...)
```

Arguments

DataOrDistances	[1:n,1:d] with: if d=n and symmetric then distance matrix assumed, otherwise: [1:n,1:d] matrix of dataset to be clustered. It consists of n cases or d-dimensional data points. Every case has d attributes, variables or features. In the latter case the Euclidean distances will be calculated.
InputPreference	Default parameter set, see apcluster
ExemplarPreferences	Default parameter set, see apcluster
DistanceMethod	DistanceMethod as in dist for similarities .
Seed	Set as integervalue to have reproducible results, see apcluster
PlotIt	Default: FALSE, If TRUE and dataset of [1:n,1:d] dimensions then a plot of the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in CIs will be generated.
Data	[1:n,1:d] data matrix in the case that DataOrDistances is missing and partial matching does not work.
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

Distancematrix D is converted to similarity matrix S with $S=-(D^2)$.

If data matrix is used, then euclidean similarities are calculated by **similarities** and a specified distance method.

The AP algorithm decides the k number of clusters.

Value

List of

`Cls` [1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.

`Object` Object defined by clustering algorithm as the other output of this algorithm

AutomaticProjectionBasedClustering
Automatic Projection-Based Clustering

Description

Performs projection-based clustering without user-interaction based on projection methods. The approach is published in [Thrun/Ultsch, 2017], [Thrun/Ultsch, 2020a].

Usage

```
AutomaticProjectionBasedClustering(DataOrDistances,ClusterNo,Type="NerV",
  StructureType = TRUE,PlotIt=FALSE,PlotTree=FALSE,PlotMap=FALSE,...)
```

Arguments

DataOrDistances	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
Type	Type of Projection method, either NerV [Venna et al., 2010] Pswarm [Thrun/Ultsch, 2020b] MDS [Torgerson, 1952] ICA [Comon, 1992] CCA [Demartines/Herault, 1995] Sammon [Sammon, 1969]

StructureType	Either compact (TRUE) or connected (FALSE), see discussion in [Thrun, 2018]
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
PlotTree	Plots the dendrogram
PlotMap	Plots the topographic map [Thrun et al., 2016].
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

The first idea of using non-PCA projections for clustering was published by [Bock, 1987] as a definition. However, to the knowledge of the author, it was not applied to any data. The coexistence of projection and clustering, which exploited the generalized U-Matrix and was introduced in [Thrun/Ultsch, 2017]. It should be noted that it is preferable to use a visualization for the Generalized U-Matrix like the topographic map `plotTopographicMap` of [Thrun et al., 2016] to evaluate the clustering, improve it or set the number of clusters appropriately. However, a comparison with 32 clustering algorithms showed that PBC is always able to find the correct cluster structure while the best of the 32 clustering algorithms varies depending on the dataset [Thrun/Ultsch, 2020].

The first systematic comparison to other DR clustering methods like Projection-Pursuit Methods `ProjectionPursuitClustering` and CA-based clustering methods can be found in [Thrun/Ultsch, 2020a]. For PCA-based clustering methods please see `TandemClustering`.

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering. . Points which cannot be assigned to a cluster will be reported with 0.
Object	Object defined by clustering algorithm as the other output of this algorithm

ClusterabilityMDplot *Clusterability MDplot*

Description

Clusterability mirrored-density plot. Clusterability aims to quantify the degree of cluster structures [Adolfsson et al., 2019]. A dataset has a high probability to possess cluster structures, if the first component of the PCA projection is multimodal [Adolfsson et al., 2019]. As the dip test is less exact than the MDplot [Thrun et al., 2019], p-values above 0.05 can be given for MDplots which are clearly multimodal.

An alternative investigation of clusterability can be performed by inspecting the topographic map of the Generalized U-Matrix for a specific projection method using the **ProjectionBasedClustering** and **GeneralizedUmatrix** packages on CRAN, see [Thrun/Ultsch, 2020] for details.

Usage

```
ClusterabilityMDplot(DataOrDistance, Method, na.rm=FALSE, ...)
```

Arguments

DataOrDistance	Either a dataset[1:n,1:d] of n cases and d features or a symmetric distance matrix [1:d,1:d] or multiple data sets or distances in a list
Method	"none" performs no dimension reduction. "pca" uses the scores from the first principal component. "distance" computes pairwise distances (using distance_metric as the metric).
na.rm	Statistical testing will not work with missing values, if TRUE values are imputed with averages
...	Further arguments like main, and ordering

Details

Use the method of [Adolfsson et al., 2019] specified as `pca plus dip-test` (PCA dip) per default without scaling or standardization of data because this step should never be done automatically. In [Thrun, 2020] the standardization and scaling did not improve the results.

If `list` is named, then the names of the list will be used and the MDplots will be re-ordered according to multimodality in the plot, otherwise only the pvalues of [Adolfsson et al., 2019] will be the names and the ordering of the MDplots is the same as the list.

Beware, as shown below, this test fails for almost touching clusters of Tetra and is difficult to interpret on WingNut but with overlaid with a robustly estimated unimodal Gaussian distribution it can be interpreted as multimodal). However, it does not fail for chaining data contrary to the claim in [Adolfsson et al., 2019].

Based on [Thrun, 2020], the author of this function disagrees with [Adolfsson et al., 2019] as to the preference which clusterability method should be used because the approach "distance" is not preferable for density-based cluster structures.

Value

ggplot2 plotter handle

Note

"none" seems to call `dip.test` in `clusterabilitytest` with high-dimensional data. In that case `dip.test` just vectorizes the matrix of the data which does not make any sense. Since this could be a bug, the "none" option should not be used.

Imputation does not work for distance matrices. Imputation is still experimental. It is advised to impute missing values before using this function

ClusterApply*Applies a function over grouped data*

Description

Applies a given function to each dimension d of data separately for each cluster

Usage

```
ClusterApply(DataOrDistances,FUN,Cls,...)
```

Arguments

DataOrDistances	[1:n,1:d] with: if d=n and symmetric then distance matrix assumed, otherwise: [1:n,1:d] matrix of defining the dataset that consists of n cases or d-dimensional data points. Every case has d attributes, variables or features.
FUN	Function to be applied to each cluster of data and each column of data
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
...	Additional parameters to be passed on to FUN

Details

Applies a given function to each feature of each cluster of data using the clustering stored in Cls which is the cluster identifiers for all rows in data. If missing, all data are in first cluster, The main output is FUNPerCluster[i] which is the result of FUN for the data points in cluster of UniqueClusters[i] named with the function's name used.

In case of a distance matrix an automatic classical multidimensional scaling transformation of distances to data is computed. Number of dimensions is selected by the minimal stress w.r.t. the possible output dimensions of cmdscale.

If FUN has not function name, then ResultPerCluster is given back.

Value

UniqueClusters	The unique clusters in Cls
FUNPerCluster	a matrix of [1:k,1:d] of d features and k clusters

ClusterChallenge	<i>Generates a Fundamental Clustering Challenge based on specific artificial datasets.</i>
------------------	--

Description

Lsun3D and FCPS datasets were introduced in various publications for a specific fixed size. This function generalizes them for any sample size.

Usage

```

ClusterChallenge(Name,SampleSize,

PlotIt=FALSE,PointSize=1,Plotter3D="rgl",...)

```

Arguments

Name	string, either 'Atom', 'Chainlink', 'EngyTime', 'GolfBall', 'Hepta', 'Lsun3D', 'Target', 'Tetra', 'TwoDiamonds', 'WingNut'
SampleSize	Size of Sample higher than 300, preferable above 500
PlotIt	TRUE: Plots the challenge with ClusterPlotMDS
PointSize	If PlotIt=TRUE: see ClusterPlotMDS
Plotter3D	If PlotIt=TRUE: see ClusterPlotMDS
...	If PlotIt=TRUE: further arguments for ClusterPlotMDS

Details

A detailed description of the datasets can be found in [Thrun/Ultsch 2020]. Sampling works by combining Pareto Density Estimation with rejection sampling.

Value

LIST, with

Name [1:SampleSize,1:d] data matrix

Cls [1:SampleSize] numerical vector of classification

Author(s)

Michael Thrun

References

[Thrun/Ultsch, 2020] Thrun, M. C., & Ultsch, A.: Clustering Benchmark Datasets Exploiting the Fundamental Clustering Problems, Data in Brief, Vol. in press, pp. 105501, doi: [10.1016/j.dib.2020.105501](https://doi.org/10.1016/j.dib.2020.105501), 2020.

[ClusterPlotMDS](#)

Examples

```
ClusterChallenge("Chainlink",2000,TRUE)
```

ClusterCount

ClusterCount

Description

Calculates statistics for clustering in each group of the data points

Usage

```
ClusterCount(Cls)
```

Arguments

Cls 1:n numerical vector of numbers defining the classification as the main output of the clustering algorithm for the n cases of data. It has k unique numbers representing the arbitrary labels of the clustering.

Details

If non finite values are given in the numerical vector, they are set to the "9999" cluster

Value

UniqueClasses	The unique clusters in Cls
CountPerClass	The number of data points in the corresponding unique clusters.
NumberOfClasses	The number of clusters
ClusterPercentages	The percentages of datapoints belonging to a cluster for each cluster

Author(s)

Michael Thrun

Examples

```
data('Hepta')
Cls=Hepta$Cls
ClusterCount(Cls)
```

ClusterCreateClassification
Create Classification for Cluster.. functions

Description

Creates a Cls from arbitrary list of objects

Usage

```
ClusterCreateClassification(Objects)
```

Arguments

Objects	Listed objects, for example factor
---------	------------------------------------

Details

See example

Value

LIST, with	
Cls	[1:n] numerical vector with n numbers defining the labels of the classification. It has 1 to k unique numbers representing the arbitrary labels of the classification.
ClusterNames	ClusterNames defined which names belongs to which unique number

Author(s)

Michael Thrun

Examples

```
## Not run:
Iris=datasets::iris
SomeFactors=Iris$Species
V=ClusterCreateClassification(SomeFactors)
Cls=V$Cls
V$ClusterNames
table(Cls,SomeFactors)

## End(Not run)
```

ClusterDendrogram	<i>Cluster Dendrogram</i>
-------------------	---------------------------

Description

Presents a dendrogram of a given tree using a colorsequence for the branches defined from the highest cluster size to the lowest cluster size.

Usage

```
ClusterDendrogram(TreeOrDendrogram, ClusterNo,
  Colorsequence,main='Name of Algorithm')
```

Arguments

TreeOrDendrogram	Either object of hclust defining the tree, third list element of hierarchical cluster algorithms of this package or Object of class dendrogram, second list element of hierarchical cluster algorithms.
ClusterNo	k number of clusters for cutree.
Colorsequence	[1:k] character vector of colors, per default the colorsquence defined in the DataVisualizations is used
main	Title of plot

Details

Requires the package **dendextend** to work correctly.

Value

In mode invisible:

[1:n] numerical vector defining the clustering of k clusters; this classification is the main output of the algorithm.

Author(s)

Michael Thrun

See Also

[cutree](#), [hclust](#)

Examples

```
data(Lsun3D)

Tree=listofh$Object
#given colors are per default:
#"magenta" "yellow" "black" "red"
ClusterDendrogram(Tree, 4,main='Single Linkage Clustering')

listofh=HierarchicalClustering(Lsun3D$Data,4)
ClusterCount(listofh$Cls)
#c1 is magenta, c2 is red, c3 is yellow, c4 is black
#because the order of the cluster sizes is
#c1,c3,c4,c2
```

ClusterDistances

ClusterDistances

Description

Computes intra-cluster distances which are the distance in-between each cluster.

Usage

```
ClusterDistances(FullDistanceMatrix, Cls,
Names, PlotIt = FALSE)
```

Arguments

FullDistanceMatrix	[1:n,1:n] symmetric distance matrix
Cls	[1:n] numerical vector of k classes
Names	Optional [1:k] character vector naming k classes
PlotIt	Optional, Plots if TRUE

Details

Cluster distances are given back as a matrix, one column per cluster and the vector of the full distance matrix without the diagonal elements and the upper half of the symmetric matrix.

Value

Matrix [1:m,1:(k+1)] of k clusters, each columns consists of the distances in a cluster, filled up with NaN at the end to be of the same length as the complete distance matrix.

ClusteringAccuracy *ClusterAccuracy*

Description

ClusterAccuracy

Usage

```
ClusterAccuracy(PriorCls,CurrentCls,K=9)
```

Arguments

PriorCls	Ground truth,[1:n] numerical vector with n numbers defining the classification. It has k unique numbers representing the arbitrary labels of the clustering.
CurrentCls	Main output of the clustering, [1:n] numerical vector with n numbers defining the classification. It has k unique numbers representing the arbitrary labels of the clustering.
K	Maximal number of classes for computation.

Details

Here, accuracy is defined as the normalized sum over all true positive labeled data points of a clustering algorithm. The best of all permutation of labels with the highest accuracy is selected in every trial because algorithms arbitrarily define the labels [Thrun et al., 2018].

In contrast to the F-measure, "Accuracy tends to be naturally unbiased, because it can be expressed in terms of a binomial distribution: A success in the underlying Bernoulli trial would be defined as sampling an example for which a classifier under consideration makes the right prediction. By definition, the success probability is identical to the accuracy of the classifier. The i.i.d. assumption implies that each example of the test set is sampled independently, so the expected fraction of correctly classified samples is identical to the probability of seeing a success above. Averaging over multiple folds is identical to increasing the number of repetitions of the Binomial trial. This does not affect the posterior distribution of accuracy if the test sets are of equal size, or if we weight each estimate by the size of each test set." [Forman/Scholz, 2010]

Value

Accuracy between zero and one

Author(s)

Michael Thrun

table(Cls$Cls,Hepta$Cls)
ClusterAccuracy(Hepta$Cls,Cls$Cls)
```

ClusterInterDistances *Computes Inter-Cluster Distances*

Description

Computes inter-cluster distances which are the distance between each cluster and all other clusters

Usage

```
InterClusterDistances(FullDistanceMatrix, Cls,  
Names, PlotIt=FALSE)
```

Arguments

FullDistanceMatrix	[1:n,1:n] symmetric distance matrix
Cls	[1:n] numerical vector of numbers defining the classification as the main output of the clustering algorithm for the n cases of data. It has k unique numbers representing the arbitrary labels of the clustering.
Names	Optional [1:k] character vector naming k classes
PlotIt	Optional, Plots if TRUE

Details

Cluster distances are given back as a matrix, one column per cluster and the vector of the full distance matrix without the diagonal elements and the upper half of the symmetric matrix.

Value

Matrix [1:m,1:(k+1)] of k clusters, each columns consists of the distances between a cluster and all other clusters, filled up with NaN at the end to be of the same length as the complete distance matrix.

```

ClusterNoEstimation *Estimates Number of Clusters using up to 26 Indicators*

Description

Calculation of up to 26 indicators and the recommendations based on them for the number of clusters in data sets. For a given dataset and clusterings for this dataset, key indicators mentioned in details are calculated and based on this a recommendation regarding the number of classes is given for each indicator.

An alternative estimation of the cluster number can be done by counting the valleys of the topographic map of the generalized U-Matrix for a specific projection method using the **ProjectionBasedClustering** and **GeneralizedUmatrix** packages on CRAN, see [Thrun/Ultsch, 2020] for details.

Usage

```
ClusterNoEstimation(DataOrDistances, ClsMatrix = NULL, max.nc,
index = "all", min.nc = 2,
Silent = TRUE, method = NULL,
PlotIt=TRUE,SelectByABC=TRUE,Colorsequence)
```

Arguments

DataOrDistances	Either [1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features. or Symmetric [1:n,1:n] distance matrix
ClsMatrix	[1:n,1:(max.nc)] Clustering of the number of classes to be checked as a matrix with one cluster per column (see also details (2) and (3)), must be specified if method = NULL
max.nc	Highest number of classes to be checked
method	Cluster procedure, with which the clusterings are created (see details (4) for possible methods), must be specified if ClsMatrix = NULL Optional:
index	String or vector of strings with the indicators to be calculated (see details (1)), default = "all"
min.nc	Lowest number of classes to be checked, default = 2

Silent	If TRUE status messages are output, default = FALSE
PlotIt	If TRUE plots fanplot with proposed cluster numbers
SelectByABC	If PlotIt=TRUE, TRUE: Plots group A of ABCanalysis of the most important ones (highest overlap in indicators), FALSE: plots all indicators
Colorsequence	Optional, character vector of sufficient length of colors for the fan plot.If the sequence is too long the first part of the sequence is used.

Details

Each column of `ClsMatrix` has to have at least two unique clusters defined. Otherwise the function will stop.

(1)

The following 26 indicators can be calculated: "ball", "beale", "calinski", "ccc", "cindex", "db", "duda", "dunn", "frey", "friedman", "hartigan", "kl", "marriot", "mcclain", "pseudot2", "ptbiserial", "ratkowsky", "rubin", "scott", "sdbw", "sdindex", "silhouette", "ssi", "tracew", "trcovw", "xuindex".

These can be specified individually or as a vector via the parameter `index`. If you enter 'all', all key figures are calculated.

(2)

The indicators `kl`, `duda`, `pseudot2`, `beale`, `frey` and `mcclain` require a clustering for $\text{max.nc}+1$ classes. If these key figures are to be calculated, this clustering must be specified in `cls`.

(3)

The indicator `kl` requires a clustering for $\text{min.nc}-1$ classes. If this key figure is to be calculated, this clustering must also be specified in `cls`. For the case $\text{min.nc} = 2$ no clustering for 1 has to be given.

(4)

The following methods can be used to create clusterings:

"ward.D", "single", "complete", "average", "mcquitty" "median," "centroid," "ward.D2," "kmeans," "DBSclustering,"

(5)

The indicators `duda`, `pseudot2`, `beale` and `frey` are only intended for use in hierarchical cluster procedures.

If a distances matrix is given, then **ProjectionBasedClustering** is required to be accessible.

Value

Indicators	A table of the calculated indicators except Duda, Pseudot2 and Beale
ClusterNo	The recommended number of clusters for each calculated indicator
ClsMatrix	[1:n,min.nc:(max.nc)] Output of the clusterings used for the calculation
HierarchicalIndicators	Either NULL or the values for the indicators Duda, Pseudot2 and Beale in case of hierarchical cluster procedures, if calculated

Note

Code of "calinski", "cindex", "db", "hartigan", "ratkowsky", "scott", "marriot", "ball", "trcovw", "tracew", "friedman", "rubin", "ssi" of package cclust ist adapted for the purpose of this function.

Colorsequence works if **DataVisualizations** 1.1.13 is installed (currently only on github available).

[Thrun/Ultsch, 2020] Thrun, M. C., and Ultsch, A.: Swarm Intelligence for Self-Organized Clustering, Artificial Intelligence, in press, <https://doi.org/10.1016/j.artint.2020.103237>, 2020.

Examples

```
# Reading the iris dataset from the standard R-Package datasets
data <- as.matrix(iris[,1:4])

# Creating the clusterings for the data set
#(here with method complete) for the number of classes 2 to 8
hc <- hclust(dist(data), method = "complete")
clsm <- matrix(data = 0, nrow = dim(data)[1], ncol = 7)
for (i in 2:8) {
  clsm[,i-1] <- cutree(hc,i)
}

# Calculation of all indicators and recommendations for the number of classes
indicatorsList=ClusterNoEstimation(Data = data, ClsMatrix = clsm, max.nc = 7)

# Alternatively, the same calculation as above can be executed with the following call
ClusterNoEstimation(Data = data, max.nc = 7, method = "complete")
# In this variant, the function clusternumbers also takes over the clustering
```

Description

This function uses a projection method to perform dimensionality reduction (DR) on order to visualize the data as 3D data points colored by a clustering.

Usage

```
ClusterPlotMDS(DataOrDists, Cls, main = "Clustering",
method = "euclidean", OutputDimension = 3,
PointSize=1,Plotter3D="rgl",Colorsequence, ...)
```

Arguments

DataOrDists	Either nonsymmetric [1:n,1:d] datamatrix of n cases and d features or symmetric [1:n,1:n] distance matrix
Cls	1:n numerical vector of numbers defining the classification as the main output of the clustering algorithm for the n cases of data. It has k unique numbers representing the arbitrary labels of the clustering.
main	String, title of plot
method	Method to compute distances, default "euclidean"
OutputDimension	Either two or three depending on user choice
PointSize	Scalar defining the size of points
Plotter3D	In case of 3 dimensions, choose either "plotly" or "rgl",
Colorsequence	[1:k] character vector of colors, per default the colorsequence defined in the DataVisualizations is used
...	Please see Plot3D in DataVisualizations

Details

If dataset has more than 3 dimensions, mds is performed as defined in the **smacof** [De Leeuw/Mair, 2011]. If **smacof** package is not installed, classical metric MDS (see Def. in [Thrun, 2018]) is performed. In both cases, the first OutputDimension are visualized. Points are colored by the labels (Cls).

In the special case that the dataset has not more than 3 dimensions, all dimensions are visualized and no DR is performed.

Value

The rgl or plotly plot handler depending on Plotter3D

Note

If **DataVisualizations** is not installed a 2D plot using native plot function is shown.

If **MASS** is not installed, classical metric MDS is used, see [Thrun, 2018] for definition.

ClusterRename	<i>Renames Clustering</i>
---------------	---------------------------

Description

Renames Clustering such that the names of the numerical vectors are the row names of DataOrDistances

Usage

```
ClusterRename(Cls, DataOrDistances)
```

Arguments

Cls	1:n numerical vector of numbers defining the classification as the main output of the clustering algorithm for the n cases of data. It has k unique numbers representing the arbitrary labels of the clustering.
DataOrDistances	Either nonsymmetric [1:n,1:d] datamatrix of n cases and d features or symmetric [1:n,1:n] distance matrix

Details

If DataOrDistances is missing or if inconsistent length, nothing is done.

Value

Cls[1:n] numerical vector named after the row names of data

Author(s)

Michael Thrun

Examples

```
data('Hepta')
Cls=Hepta$Cls
Data=Hepta$Data#
#prior
Cls
#Named Clustering
ClusterRename(Cls,Data)
```

ClusterRenameDescendingSize

ClusterRenameDescendingSize

Description

Renames the clusters of a classification in descending order.

Usage

```
ClusterRenameDescendingSize(Cls)
```

Arguments

Cls	[1:n numerical vector of numbers defining the classification as the main output of the clustering algorithm for the n cases of data. It has k unique numbers representing the arbitrary labels of the clustering.
-----	---

Value

RenamedCls	The renamed classification. A vector of clusters, were the largest cluster is C1 and so forth
------------	---

Author(s)

Michael Thrun, Alfred Ultsch

Examples

```
data('Lsun3D')
Cls=Lsun3D$Cls
#not desceending cluster numbers
Cls[Cls==1]=543
Cls[Cls==4]=1

# Now ordered ber cluster size and descending
ClusterRenameDescendingSize(Cls)
```

 CrossEntropyClustering

Cross-Entropy Clustering

Description

Neural gas clustering published by [Tabor/Spurek, 2014] and implemented by [Spurek et al., 2017].

Usage

```
CrossEntropyClustering(Data, ClusterNo, PlotIt=FALSE, ...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

Contrary to most of the other implemented algorithms in this package, the results on the easiest clustering challenge of Hepta are unstable for cross-entropy clustering in the sense that the clustering is not always correct. Reproducibility experiments should be performed (see [Tabor/Spurek, 2014]).

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

Author(s)

Michael Thrun

data('Hepta')
out=CrossEntropyClustering(Hepta$Data,ClusterNo=7,PlotIt=FALSE)
```

DBscan

*DBscan***Description**

DBscan clustering

Usage

```
DBscan(Data,Radius,minPts,
PlotIt=FALSE,UpperLimitRadius,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
Radius	Eps [Ester et al., 1996, p. 227] neighborhood in the R-ball graph/unit disk graph), size of the epsilon neighborhood. If NULL, automatic estimation is performed using insights of [Ultsch, 2005].
minPts	Number of minimum points in the eps region (for core points). In principle minimum number of points in the unit disk, if the unit disk is within the cluster (core) [Ester et al., 1996, p. 228]. If NULL, 2.5 percent of points is selected.
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in C1s
UpperLimitRadius	Limit for radius search, experimental
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Value

List of	
C1s	[1:n] numerical vector defining the clustering; this classification is the main output of the algorithm. Points which cannot be assigned to a cluster will be reported as members of the noise cluster with 0.
Object	Object defined by clustering algorithm as the other output of this algorithm

Examples

```

data('Hepta')

out=DBscan(Hepta$Data,Radius=NULL,minPts=NULL,PlotIt=FALSE)

#search for right parameter setting by grid search
data("WingNut")
Data = WingNut$Data
DBSGrid <- expand.grid(
  Radius = seq(from = 0.01, to = 0.3, by = 0.02),
  minPts = seq(from = 1, to = 50, by = 2)
)
BestAcc = c()
for (i in seq_len(nrow(DBSGrid))) {
  print(i)
  parameters <- DBSGrid[i,]
  Cls9 = DBscan(
    Data,
    minPts = parameters$minPts,

    Radius = parameters$Radius,
    PlotIt = F,

    UpperLimitRadius = parameters$Radius
  )$Cls
  if (length(unique(Cls9)) < 5)
    BestAcc[i] = DatabionicSwarm::ClusteringAccuracy(WingNut$Cls,
                                                    Cls9) * 100
  else
    BestAcc[i] = 50
}
max(BestAcc)
which.max(BestAcc)
parameters <- DBSGrid[13,]

Cls9 = DBscan(
  Data,
  minPts = parameters$minPts,
  Radius = parameters$Radius,
  UpperLimitRadius = parameters$Radius,
  PlotIt = TRUE

```

```
)$Cls
```

DBScusteringAndVisualization

Databionic Swarm (DBS) Clustering and Visualization

Description

Swarm-based clustering by exploiting self-organization, emergence, swarm intelligence and game theory.

Usage

```
DatabionicSwarmClustering(DataOrDistances, ClusterNo = 0,
StructureType = TRUE, DistancesMethod = NULL,
PlotTree = FALSE, PlotMap = FALSE, PlotIt=FALSE, Data)
```

Arguments

DataOrDistances	Either nonsymmetric [1:n,1:d] datamatrix of n cases and d features or Symmetric [1:n,1:n] distance matrix
ClusterNo	Number of Clusters, if zero a the topographic map is plotted. Number of valleys equals number of clusters.
StructureType	Either TRUE or FALSE, has to be tested against the visualization. If colored points of clusters a divided by mountain ranges, parameter is incorrect.
DistancesMethod	Optional, if data matrix given, anonon Euclidean distance can be selected
PlotTree	Optional, if TRUE: dendrogram is plotted.
PlotMap	Optional, if TRUE: topographic map is plotted.
PlotIt	Default: FALSE, If TRUE and dataset of [1:n,1:d] dimensions then a plot of the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls will be generated.
Data	[1:n,1:d] data matrix in the case that DataOrDistances is missing and partial matching does not work.

Details

This function does not enable the user first to project the data and then to test the Boolean parameter defining the type of structure contrary to the **DatabionicSwarm** which is an inappropriate approach in case of exploratory data analysis.

Instead, this function is implemented for the purpose of automatic benchmarking because in such a case nobody will investigate many trials with one visualization per trial.

If one would like to perform a clustering exploratively (in the sense that a prior clustering is not given for evaluation purposes), then please use the **DatabionicSwarm** package directly and read the vignette there. Databionic swarm is like k-means a stochastic algorithm meaning that the clustering and visualization may change between trials.

Value

List of

Cls 1:n numerical vector of numbers defining the classification as the main output of the clustering algorithm for the n cases of data. It has k unique numbers representing the arbitrary labels of the clustering.

Object List of further output of DBS

Note

Current implementation is not efficient enough to cluster more than N=4000 cases as in that case it takes longer than a day for a result.

#entagled, complex, and non-linear seperable structures

data(Chainlink)
#DataVisualizations::Plot3D(Chainlink$Data)

# 2 valleys are visible, thus ClusterNo=2
Cls = DatabionicSwarmClustering(Chainlink$Data, 0, PlotMap = T)

# Experiment with parameter StructureType only
# reveals that clustering is appropriate
# if StructureType=FALSE
Cls = DatabionicSwarmClustering(Chainlink$Data,
                                2,
                                StructureType = FALSE,
                                PlotMap = T)

# Here clusters (colored points)
# are not seperated by valleys
Cls = DatabionicSwarmClustering(Chainlink$Data,
                                2,
                                StructureType = TRUE,
                                PlotMap = T)

```

DensityPeakClustering *Density Peak Clustering algorithm using the Decision Graph*

Description

Density peaks clustering of [Rodriguez/Laio, 2014] is here implemented by [Pedersen et al., 2017] with estimation of [Wang et al, 2015] meaning its non adaptive in the sense of [ADPclustering](#).

Usage

```
DensityPeakClustering(DataOrDistances, Rho,Delta,Dc,Knn=7,
method = "euclidean", PlotIt = FALSE, Data, ...)
```

Arguments

DataOrDistances	Either [1:n,1:n] symmetric distance matrix or [1:n,1:d] non symmetric data matrix of n cases and d variables
Rho	Local density of a point, see [Rodriguez/Laio, 2014] for explanation
Delta	Minimum distance between a point and any other point, see [Rodriguez/Laio, 2014] for explanation
Dc	Optional, cutoff distance, will either be estimated by [Pedersen et al., 2017] or [Wang et al, 2015] (see example below)
Knn	Optional k nearest neighbors
method	Optional distance method of data, default is euclid, see parDist for details
PlotIt	Optional TRUE: Plots 2d or 3d result with clustering
Data	[1:n,1:d] data matrix in the case that DataOrDistances is missing and partial matching does not work.
...	Optional, further arguments for densityClust

Details

The densityClust algorithm does not decide the k number of clusters, this has to be done by the parameter setting. This is contrary to the other version of the algorithm from another package which can be called with [ADPclustering](#).

The plot shows the density peaks (Cluster centers). Set Rho and Delta as boundaries below the number of relevant cluster centers for your problem. (see example below).

Value

If Rho and Delta are set:

list of

Cls	[1:n numerical vector of numbers defining the classification as the main output of the clustering algorithm for the n cases of data. It has k unique numbers representing the arbitrary labels of the clustering.
-----	---

Object	output of [Pedersen et al., 2017] algorithm
--------	---

If Rho and Delta are missing:

p	object of plot_ly for the decision graph is returned
---	--

```

DivisiveAnalysisClustering

Large DivisiveAnalysisClustering Clustering

Description

Divisive Analysis Clustering (diana) of [Rousseeuw/Kaufman, 1990]

Usage

```
DivisiveAnalysisClustering(DataOrDistances, ClusterNo,
PlotIt=FALSE,Standardization=TRUE,Data,...)
```

Arguments

DataOrDistances	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features. Alternatively, symmetric [1:n,1:n] distance matrix
ClusterNo	A number k which defines k different clusters to be build by the algorithm. if ClusterNo=0, the dendrogram is generated instead of a clustering to estimate the numbers of clusters.
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
Standardization	DataOrDistances Is standardized before calculating the dissimilarities. Measurements are standardized for each variable (column), by subtracting the variable's mean value and dividing by the variable's mean absolute deviation.If DataOrDistances Is already a distance matrix, then this argument will be ignored.
Data	[1:n,1:d] data matrix in the case that DataOrDistances is missing and partial matching does not work.
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Dendrogram	Dendrogram of hierarchical clustering algorithm
Object	Object defined by clustering algorithm as the other output of this algorithm

Examples

```
data(EngyTime)  
str(EngyTime)
```

EntropyOfDataField

Entropy Of a Data Field [Wang et al., 2011].

Description

Calculates the Potential Entropy Of a Data Field for a given ranges of impact factors sigma

Usage

```
EntropyOfDataField(Data,  
  
sigmarange = c(0.01, 0.1, 0.5, 1, 2, 5, 8, 10, 100)  
  
, PlotIt = TRUE)
```

Arguments

Data	[1:n,1:d] data matrix
sigmarange	Numeric vector [1:s] of relevant sigmas
PlotIt	FALSE: disable plot, TRUE: Plot with upper boundary of H after [Wang et al., 2011].

Details

In theory there should be a curve with a clear minimum of Entropy [Wang et al.,2011]. Then the choice for the impact factor sigma is the minimum of the entropy to define the correct data field. It follows, that the influence radius is $3/\sqrt{2}*\sigma$ (3B rule of gaussian distribution) for clustering algorithms like density peak clustering [Wang et al.,2011].

Value

1:s named vector of the Entropy of data field. The names are the impact factor sigma.

Examples

```
data(Hepta)
H=EntropyOfDataField(Hepta$Data,PlotIt=FALSE)
Sigmamin=names(H)[which.min(H)]
Dc=3/sqrt(2)*as.numeric(names(H)[which.min(H)])
```

EstimateRadiusByDistance

Estimate Radius By Distance

Description

Published in [Thrun et al, 2016] for the case of automatically estimating the radius of the P-matrix. Can also be used to estimate the radius parameter for distance based clustering algorithms.

Usage

```
EstimateRadiusByDistance(DistanceMatrix)
```

Arguments

DistanceMatrix [1:n,1:n] symmetric distance Matrix of n cases

Details

For density-based clustering algorithms like [DBscan](#) it is not always usefull.

Value

Numerical scalar defining the radius

Note

Symmetric matrix is assumed.

GenieClustering

*Genie Clustering by Gini Index***Description**

Outlier Resistant Hierarchical Clustering Algorithm of [Gagolewski/Bartoszuk, 2016].

Usage

```
GenieClustering(DataOrDistances, ClusterNo = 0,
DistanceMethod="euclidean", ColorTreshold = 0,...)
```

Arguments

DataOrDistances	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features. Alternatively, symmetric [1:n,1:n] distance matrix
ClusterNo	A number k which defines k different clusters to be build by the algorithm.
DistanceMethod	See parDist , for example 'euclidean', 'mahalanobis', 'manhattan' (cityblock), 'fJaccard', 'binary', 'canberra', 'maximum'. Any unambiguous substring can be given.
ColorTreshold	Draws cutline w.r.t. dendrogram y-axis (height), height of line as scalar should be given
...	further argument to genie like: thresholdGini Single numeric value in [0,1], threshold for the Gini index, 1 gives the standard single linkage algorithm

Details

Wrapper for Genie algorithm.

Value

List of	
Cls	If, ClusterNo>0: [1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering. Otherwise for ClusterNo=0: NULL
Dendrogram	Dendrogram of hierarchical clustering algorithm

HierarchicalClusterData

Hierarchical Clusterering of Data

Description

Hierarchical cluster analysis on a set of dissimilarities and methods for analyzing it. Uses stats package function 'hclust'.

Usage

```
HierarchicalClusterData(Data,ClusterNo=0,
method="ward.D2",DistanceMethod="euclidean",
ColorTreshold=0,Fast=FALSE,Cls=NULL,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be build by the algorithm.
method	Methoden der Clustering: "ward.D", "ward.D2", "single", "complete", "average", "mcquitty", "median" or "centroid".
DistanceMethod	see <code>parDist</code> , for example 'euclidean', 'mahalanobis', 'manhattan' (cityblock), 'Jaccard', 'binary', 'canberra', 'maximum'. Any unambiguous substring can be given.
ColorTreshold	Draws outline w.r.t. dendrogram y-axis (height), height of line as scalar should be given
Fast	If TRUE and fastcluster installed, then a faster implementation of the methods above can be used
Cls	[1:n] classification vector for coloring of dendrogram in plot
...	In case of plotting further argument for plot, see <code>as.dendrogram</code>

Value

List of	
Cls	If, ClusterNo>0: [1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering. Otherwise for ClusterNo=0: NULL
Dendrogram	Dendrogram of hierarchical clustering algorithm
Object	Ultrametric tree of hierarchical clustering algorithm

Author(s)

Michael Thrun

Examples

```
data('Hepta')
#out=HierarchicalClusterData(Hepta$Data,ClusterNo=7)
```

HierarchicalClusterDists

Hierarchical Clustering with Distances

Description

Hierarchical cluster analysis on a set of dissimilarities and methods for analyzing it. Uses stats package function 'hclust'.

Usage

```
HierarchicalClusterDists(pDist,ClusterNo=0,method="ward.D2",
  ColorTreshold=0,Fast=FALSE,...)
```

Arguments

pDist	Distances as either matrix [1:n,1:n] or dist object
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
method	Method of cluster analysis: "ward.D", "ward.D2", "single", "complete", "average", "mcquitty", "median" or "centroid".
ColorTreshold	Draws cutline w.r.t. dendrogram y-axis (height), height of line as scalar should be given
Fast	If TRUE and fastcluster installed, then a faster implementation of the methods above can be used
...	In case of plotting further argument for plot, see as.dendrogram

Value

List of	
Cls	If, ClusterNo>0: [1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering. Otherwise for ClusterNo=0: NULL
Dendrogram	Dendrogram of hierarchical clustering algorithm
Object	Ultrametric tree of hierarchical clustering algorithm

Author(s)

Michael Thrun

Examples

```
data('Hepta')
#out=HierarchicalClusterDists(as.matrix(dist(Hepta$Data)),ClusterNo=7)
```

HierarchicalClustering

Hierarchical Clustering

Description

Wrapper for various agglomerative hierarchical clustering algorithms.

Usage

```
HierarchicalClustering(DataOrDistances,ClusterNo,method='SingleL',Fast=TRUE,Data,...)
```

Arguments

DataOrDistances	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features. Alternatively, symmetric [1:n,1:n] distance matrix
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
method	Method of cluster analysis: "Ward", "SingleL", "CompleteL", "AverageL" (UP-GMA), "WPGMA" (mcquitty), "MedianL" (WPGMC), "CentroidL" (UPGMC), "Minimax", "MinEnergy", "Gini" or "HDBSCAN".
Fast	If TRUE and fastcluster installed, then a faster implementation of the methods above can be used except for "Minimax", "MinEnergy", "Gini" or "HDBSCAN"
Data	[1:n,1:d] data matrix in the case that DataOrDistances is missing and partial matching does not work.
...	Further arguments passed on to either HierarchicalClusterData , HierarchicalClusterDists , MinimalEnergyClustering or GenieClustering (for "Gini") or Hierarchical_DBSCAN (for HDBSCAN) .

Details

Please see [HierarchicalClusterData](#) and [HierarchicalClusterDists](#) or the other functions listed above.

It should be noted that in case of "HDBSCAN" the number of clusters is manually selected by cutree to have the same convention as the other algorithms. Usually, "HDBSCAN" selects the number of clusters automatically.

Value

List of	
Cls	If, ClusterNo>0: [1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering. Otherwise for ClusterNo=0: NULL
Dendrogram	Dendrogram of hierarchical clustering algorithm
Object	Ultrametric tree of hierarchical clustering algorithm

Hierarchical_DBSCAN *Hierarchical DBSCAN*

Description

Hierarchical DBSCAN clustering [Campello et al., 2015].

Usage

```
Hierarchical_DBSCAN(DataOrDistances,minPts=4,  

PlotTree=FALSE,PlotIt=FALSE,...)
```

Arguments

DataOrDistances	Either a [1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features. or a [1:n,1:n] symmetric distance matrix.
minPts	Classic smoothing factor in density estimates [Campello et al., 2015, p.9]
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in C1s
PlotTree	Default: FALSE, If TRUE plots the dendrogram. If minPts is missing, PlotTree is set to TRUE.
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

"Computes the hierarchical cluster tree representing density estimates along with the stability-based flat cluster extraction proposed by Campello et al. (2013). HDBSCAN essentially computes the hierarchy of all DBSCAN* clusterings, and then uses a stability-based extraction method to find optimal cuts in the hierarchy, thus producing a flat solution." [Hahsler et al., 2019]

It is claimed by the inventors that the minPts parameter is noncritical [Campello et al., 2015, p.35]. minPts is reported to be set to 4 on all experiments [Campello et al., 2015, p.35].

Value

List of	
Cls	[1:n] numerical vector defining the clustering; this classification is the main output of the algorithm. Points which cannot be assigned to a cluster will be reported as members of the noise cluster with 0.
Dendrogram	Dendrogram of hierarchical clustering algorithm
Tree	Ultrametric tree of hierarchical clustering algorithm
Object	Object defined by clustering algorithm as the other output of this algorithm

Author(s)

Michael Thrun

CA=Hierarchical_DBSCAN(Leukemia$DistanceMatrix)
#ClusterCount(CA$Cls)
#ClusterDendrogram(CA$Dendrogram,5,main='H-DBscan')
```

kmeansClustering

K-Means Clustering

Description

Perform k-means clustering on a data matrix.

Usage

```
kmeansClustering(DataOrDistance, ClusterNo,

Type = 'LBG',RandomNo=5000, PlotIt=FALSE, Verbose = FALSE,... )
```

Arguments

DataOrDistance	Either nonsymmetric [1:n,1:d] datamatrix of n cases and d features or symmetric [1:n,1:n] distance matrix
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
RandomNo	Only for " Steinley" or in case of distance matrix, number of random initializations with searching for minimal SSE, see [Steinley/Brusco, 2007]
Type	Choice of Kmeans algorithm, currently either " Hartigan" [Hartigan/Wong, 1979], "LBG" [Linde et al., 1980], "Steinley" best method of [Steinley/Brusco, 2007] proposed in Steinley 2003, " Lloyd" [Lloyd, 1982], "Forgy"[Forgy, 1965] or MacQueen [MacQueen, 1967]
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in C1s
Verbose	Print details, if true
...	Further arguments like iter.max, nstart,...

Details

Uses either stats package function 'kmeans', cclust package implementation or own code. In case of a distance matrix, RandomNo should be significantly lower than 5000, otherwise a long computation time is to be expected.

Value

List V of	
C1s	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	List V of SumDistsToCentroids: Vector of within-cluster sum of squares, one component per cluster Centroids: the final cluster centers.

Note

The version using a distance matrix is still in the test phase and not yet verified.

Examples

```
data('Hepta')
out=kmeansClustering(Hepta$Data,ClusterNo=7,PlotIt=FALSE)
```

```
data('Leukemia')
# As expected does not perform well
# For non-spherical cluster structures:
out=kmeansClustering(Leukemia$DistanceMatrix,ClusterNo=6,RandomNo =10,PlotIt=TRUE)
```

```
data('Hepta')
out=kmeansClustering(Hepta$Data,ClusterNo=7,
PlotIt=FALSE,Type="Steinley")
```

kmeansDist

k-means Clustering using a distance matrix

Description

Perform k-means clustering on a distance matrix

Usage

```
kmeansDist(Distance, ClusterNo=2,Centers=NULL,
RandomNo=1,maxIt = 2000,
PlotIt=FALSE,verbose = F)
```

Arguments

Distance	Distance matrix. For n data points of the dimension n x n
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
Centers	Default(NULL) a set of initial (distinct) cluster centres.
RandomNo	If>1: Number of random initializations with searching for minimal SSE is defined by this scalar
maxIt	Optional: Maximum number of iterations before the algorithm terminates.
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
verbose	Optional: Algorithm always outputs current iteration.

Value

Cls[1:n]	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
centerids[1:k]	Indices of the centroids from which the cluster Cls was created

Note

Currently an experimental version

Author(s)

Felix Pape, Michael Thrun

Examples

```
data('Hepta')
#out=kmeansDist(as.matrix(dist(Hepta$Data)),ClusterNo=7,PlotIt=FALSE,RandomNo = 10)

data('Leukemia')
#as expected does not perform well
#for non-spherical cluster structures:
out=kmeansDist(Leukemia$DistanceMatrix,ClusterNo=6,PlotIt=TRUE,RandomNo=10)
```

LargeApplicationClustering

Large Application Clustering

Description

Clustering Large Applications (clara) of [Rousseeuw/Kaufman, 1990]

Usage

```
LargeApplicationClustering(Data, ClusterNo,
PlotIt=FALSE, Standardization=TRUE, Samples=50, Random=TRUE, ...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
Standardization	Data is standardized before calculating the dissimilarities. Measurements are standardized for each variable (column), by subtracting the variable's mean value and dividing by the variable's mean absolute deviation.
Samples	Integer, say N, the number of samples to be drawn from the dataset. Default value set as recommended by documentation of clara
Random	Logical indicating if R's random number generator should be used instead of the primitive clara()-builtin one.
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

It is recommended to use `set.seed` if clustering output should be always the same instead of setting `Random=FALSE` in order to use the primitive `clara()`-builtin random number generator.

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

```

Leukemia

Leukemia distance matrix and classification used in [Thrun, 2018]

Description

Data is anonymized. Original dataset was published in [Haferlach et al., 2010]. Original dataset had around 12.000 dimensions. Detailed description of preprocessed dataset and its clustering challenge is provided in [Thrun/Ultsch, 2020].

Usage

```
data("Leukemia")
```

Details

554x554 distance matrix. Cls defines the following clusters:

1= APL Outlier

2=APL

3=Healthy

4=AML

5=CLL

6=CLL Outlier

data(Leukemia)
str(Leukemia)
Cls=Leukemia$Cls
Distance=Leukemia$DistanceMatrix
isSymmetric(Distance)
```

Lsun3D

Lsun3D inspired by FCPS introduced in [Thrun, 2018]

Description

Clearly defined clusters, different variances. Detailed description of dataset and its clustering challenge is provided in [Thrun/Ultsch, 2020].

Usage

```
data("Lsun3D")
```

Details

Size 404, Dimensions 3

Dataset defines discontinuities, where the clusters have different variances. Three main clusters, and four outliers (in cluster 4). For a more detailed description see [Thrun, 2018].

Examples

```
data(Lsun3D)
str(Lsun3D)
Cls=Lsun3D$Cls
Data=Lsun3D$Data
```

MarkovClustering

Markov Clustering

Description

Graph clustering algorithm introduced by [van Dongen, 2000].

Usage

```
MarkovClustering(Data=NULL,Adjacency=NULL,Radius=TRUE,addLoops =TRUE,PlotIt=FALSE,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features. This is used if Adjacency is missing. Then a unit-disk (R-ball) graph is calculated.
Adjacency	Used if Data is missing, matrix [1:n,1:n] defining which points are adjacent to each other by the number 1; not adjacent: 0
Radius	Radius for unit disk graph (r-ball graph) if adjacency matrix is missing. Automatic estimation can be done either with =TRUE [Ultsch, 2005] or FALSE [Thrun et al., 2016]
addLoops	Logical; if TRUE, self-loops with weight 1 are added to each vertex of x (see mc1 of CRAN package MCL).
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

...

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering. Points which cannot be assigned to a cluster will be reported with 0.
Object	Object defined by clustering algorithm as the other output of this algorithm

Examples

```
data('Hepta')
out=MarkovClustering(Data=Hepta$Data,PlotIt=FALSE)
```

MinimalEnergyClustering

Minimal Energy Clustering

Description

Hierarchical Clustering using the minimal energy approach of [Szekely/Rizzo, 2005].

Usage

```
MinimalEnergyClustering(DataOrDistances, ClusterNo = 0,
DistanceMethod="euclidean", ColorTreshold = 0,Data,...)
```

Arguments

DataOrDistances	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features. Alternatively, symmetric [1:n,1:n] distance matrix
ClusterNo	A number k which defines k different clusters to be build by the algorithm.
DistanceMethod	See parDist , for example 'euclidean', 'mahalanobis', 'manhattan' (cityblock), 'fJaccard', 'binary', 'canberra', 'maximum'. Any unambiguous substring can be given.
ColorTreshold	Draws cutline w.r.t. dendrogram y-axis (height), height of line as scalar should be given
Data	[1:n,1:d] data matrix in the case that DataOrDistances is missing and partial matching does not work.
...	In case of plotting further argument for plot, see as.dendrogram

Value

List of	
Cls	If ClusterNo>0: [1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering. Otherwise ClusterNo=0: NULL
Dendrogram	Dendrogram of hierarchical clustering algorithm
Object	Ultrametric tree of hierarchical clustering algorithm

 MinimaxLinkageClustering

Minimax Linkage Hierarchical Clustering

Description

In the minimax linkage hierarchical clustering every cluster has an associated prototype element that represents that cluster [Bien/Tibshirani, 2011].

Usage

```
MinimaxLinkageClustering(DataOrDistances, ClusterNo = 0,
  DistanceMethod="euclidean", ColorTreshold = 0,...)
```

Arguments

DataOrDistances	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases or d-dimensional data points. Every case has d attributes, variables or features. Alternatively, symmetric [1:n,1:n] distance matrix
ClusterNo	A number k which defines k different clusters to be build by the algorithm.
DistanceMethod	See parDist , for example 'euclidean', 'mahalanobis', 'manhattan' (cityblock), 'fJaccard', 'binary', 'canberra', 'maximum'. Any unambiguous substring can be given.
ColorTreshold	Draws outline w.r.t. dendrogram y-axis (height), height of line as scalar should be given
...	In case of plotting further argument for plot, see as.dendrogram

Value

List of

Cls	If, ClusterNo>0: [1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering. Otherwise for ClusterNo=0: NULL
Dendrogram	Dendrogram of hierarchical clustering algorithm
Object	Ultrametric tree of hierarchical clustering algorithm

ModelBasedClustering *Model Based Clustering*

Description

Calls Model based clustering of [Fraley/Raftery, 2006] which models a Mixture Of Gaussians (MoG).

Usage

```
ModelBasedClustering(Data,ClusterNo=2,PlotIt=FALSE,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

see [Thrun, 2017, p. 23] or [Fraley/Raftery, 2002] and [Fraley/Raftery, 2006].

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

Note

MoGclustering used in [Thrun, 2017] was renamed to [ModelBasedClustering](#) in this package.

```

MoGclustering

MoGclustering

Description

call MixtureOfGaussians (MoG) clustering based on Expectation Maximization (EM) of [Chen et al., 2012].

Usage

```
MoGclustering(Data,ClusterNo=2,method="EM",PlotIt=FALSE,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
method	Initialization by either "EM" oder "kmeans"
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

...

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

Note

MoG used in [Thrun, 2017] was renamed to [ModelBasedClustering](#) in this package.

MSTclustering

MST-kNN clustering algorithm [Inostroza-Ponta, 2008].

Description

Performs the MST-kNN clustering algorithm which generate a clustering solution with automatic k determination using two proximity graphs: Minimal Spanning Tree (MST) and k-Nearest Neighbor (kNN) which are recursively intersected.

Usage

```
MSTclustering(DataOrDistances, method = "euclidean",PlotIt=FALSE, ...)
```

Arguments

DataOrDistances	Either [1:n,1:n] symmetric distance matrix or [1:n,1:d] not symmetric data matrix of n cases and d variables
method	Optional distance method of data, default is euclid, see parDist for details
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
...	Optional, further arguments for mst.knn

Details

Does not work on Hepta with euclidean distances.

Value

List of

Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

MSTclustering(Hepta$Data)
```

NeuralGasClustering *Neural gas algorithm for clustering*

Description

Neural gas clustering published by [Martinetz et al., 1993] and implemented by [Bodenhofer et al., 2011].

Usage

```
NeuralGasClustering(Data, ClusterNo, PlotIt=FALSE, ...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

Author(s)

Michael Thrun

Examples

```
data('Hepta')
out=NeuralGasClustering(Hepta$Data,ClusterNo=7,PlotIt=FALSE)
```

OPTICSclustering

OPTICS Clustering

Description

OPTICS (Ordering points to identify the clustering structure) clustering algorithm [Ankerst et al.,1999].

Usage

```
OPTICSclustering(Data, MaxRadius,RadiusThreshold, minPts = 5, PlotIt=FALSE,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
MaxRadius	Upper limit neighborhood in the R-ball graph/unit disk graph), size of the epsilon neighborhood (eps) [Ester et al., 1996, p. 227]. If NULL, automatic estimation is done using insights of [Ultsch, 2005].
RadiusThreshold	Threshold to identify clusters (RadiusThreshold <= MaxRadius), if NULL 0.9*MaxRadius is set.
minPts	Number of minimum points in the eps region (for core points). In principle minimum number of points in the unit disk, if the unit disk is within the cluster (core) [Ester et al., 1996, p. 228]. If NULL, its 2.5 percent of points.
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

...

Value

List of	
Cls	[1:n] numerical vector defining the clustering; this classification is the main output of the algorithm. Points which cannot be assigned to a cluster will be reported as members of the noise cluster with 0.
Object	Object defined by clustering algorithm as the other output of this algorithm

PAMclustering	<i>Partitioning Around Medoids (PAM)</i>
---------------	--

Description

Partitioning (clustering) of the data into k clusters around medoids, a more robust version of k-means [Rousseeuw/Kaufman, 1990, p. 164-198] .

Usage

```
PAMclustering(DataOrDistances,ClusterNo,
PlotIt=FALSE,Standardization=TRUE,Data,...)
```

Arguments

DataOrDistances	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features. Alternatively, symmetric [1:n,1:n] distance matrix
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
Standardization	DataOrDistances is standardized before calculating the dissimilarities. Measurements are standardized for each variable (column), by subtracting the variable's mean value and dividing by the variable's mean absolute deviation.If DataOrDistances is already a distance matrix, then this argument will be ignored.
Data	[1:n,1:d] data matrix in the case that DataOrDistances is missing and partial matching does not work.
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

[Rousseeuw/Kaufman, 1990, chapter 2] or [Reynolds et al., 1992].

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

Examples

```
data('Hepta')
out=PAMclustering(Hepta$Data,ClusterNo=7,PlotIt=FALSE)
```

pdfClustering

Probability Density Distribution Clustering

Description

Clustering via non parametric density estimation

Usage

```
pdfClustering(Data, PlotIt = FALSE, ...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

Cluster analysis is performed by the density-based procedures described in Azzalini and Torelli (2007) and Menardi and Azzalini (2014), and summarized in Azzalini and Menardi (2014).

Value

List of

Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

Author(s)

Examples

```
data('Hepta')
out=pdfClustering(Hepta$Data,PlotIt=FALSE)
```

PenalizedRegressionBasedClustering

Penalized Regression-Based Clustering of [Wu et al., 2016].

Description

Clustering is performed through penalized regression with grouping pursuit

Usage

```
PenalizedRegressionBasedClustering(Data, FirstLambda,
SecondLambda, Tau, PlotIt = FALSE, ...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
FirstLambda	Set 1 for quadratic penalty based algorithm, 0.4 for revised ADMM.
SecondLambda	The magnitude of grouping penalty.
Tau	Tuning parameter: tau, related to grouping penalty.
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
...	Further arguments for PRclust , enables also usage of [Pan et al., 2013].

Details

Parameters are rather challenging to choose.

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

Note

Data matrix is internally transposed in order to fit the definition of the algorithm.

```
data(Hepta)
Data=Hepta$Data
out=PenalizedRegressionBasedClustering(Data,0.4,1,2,FALSE)
table(out$Cls,Hepta$Cls)
```

 ProjectionPursuitClustering

Cluster Identification using Projection Pursuit as described in [Hofmeyr/Pavlidis, 2019].

Description

Summarizes recent projection pursuit methods for clustering based on [Hofmeyr/Pavlidis, 2015], [Hofmeyr, 2016] and [Pavlidis et al., 2016] .

Usage

```
ProjectionPursuitClustering(Data,ClusterNo,Type="MinimumDensity",
PlotIt=FALSE,PlotSolution=FALSE,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
Type	Either MinimumDensity[Pavlidis et al., 2016] MaximumClusterbility[Hofmeyr/Pavlidis, 2015]], or NormalisedCut [Hofmeyr, 2016] or KernelPCA [Hofmeyr/Pavlidis, 2019].
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
PlotSolution	Plots the partitioning solution as a tree as described in
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

The details of the options for projection pursuit and partitioning of data are defined in [Hofmeyr/Pavlidis, 2019].

"KernelPCA" uses additionally the package kernlab and is implemented as given in the fifth example on page 21, section "extension" of [Hofmeyr/Pavlidis, 2019].

The first idea of using non-PCA projections for clustering was published by [Bock, 1987] as an definition. However, to the knowledge of the author it was not applied to any data. The first systematic comparison to Projection-Pursuit Methods [ProjectionPursuitClustering](#) and [AutomaticProjectionBasedClustering](#) can be found in [Thrun/Ultsch, 2018]. For PCA-based clustering methods please see [TandemClustering](#)

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering. Points which cannot be assigned to a cluster will be reported with 0.
Object	Object defined by clustering algorithm as the other output of this algorithm

Examples

```
data('Hepta')
out=ProjectionPursuitClustering(Hepta$Data,ClusterNo=7,PlotIt=FALSE)
```

QTclustering

Stochastic QT Clustering

Description

Stochastic quality clustering of [Heyer et al., 1999] with an improved implementation by [Scharl/Leisch, 2006].

Usage

```
QTclustering(Data,Radius,PlotIt=FALSE,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
Radius	Maximum radius of clusters. If NULL, automatic estimation can be done with [Thrun et al., 2016] if not otherwise set.
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in C1s
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Value

List of	
C1s	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering. Points which cannot be assigned to a cluster will be reported with 0.
Object	Object defined by clustering algorithm as the other output of this algorithm

Examples

```
data('Hepta')
out=QTclustering(Hepta$Data,Radius=NULL,PlotIt=FALSE)
```

 RobustTrimmedClustering

Robust Trimmed Clustering

Description

Robust Trimmed Clustering invented by [Garcia-Escudero et al., 2008] and implemented by [Fritz et al., 2012].

Usage

```
RobustTrimmedClustering(Data, ClusterNo, Alpha,
PlotIt=FALSE, ...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in C1s
Alpha	No trimming is done equals to alpha =0, otherwise proportion of datapoints to be trimmed.
...	Further arguments to be set for the clustering algorithm, e.g. restr and restr.fact described in details. If not set, default arguments are used.

Details

"The larger restr.fact is chosen, the looser is the restriction on the scatter matrices, allowing for more heterogeneity among the clusters. On the contrary, small values of restr.fact close to 1 imply very equally scattered clusters. This idea of constraining cluster scatters to avoid spurious solutions goes back to Hathaway (1985), who proposed it in mixture fitting problems" [Fritz et al., 2012]. The type of constraint restr can be set to "eigen", "deter" or "sigma.". Please see [tclust](#) for further parameter description.

Value

List of	
C1s	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

Examples

```
data('Hepta')
out=RobustTrimmedClustering(Hepta$Data,ClusterNo=7,Alpha=0,PlotIt=FALSE)
```

SharedNearestNeighborClustering
SNN clustering

Description

Shared Nearest Neighbor Clustering of [Ertoz et al., 2003].

Usage

```
SharedNearestNeighborClustering(Data,Knn=7,
Radius,minPts,PlotIt=FALSE,
UpperLimitRadius,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
Knn	Number of neighbors to consider to calculate the shared nearest neighbors.
Radius	Eps [Ester et al., 1996, p. 227] neighborhood in the R-ball graph/unit disk graph), size of the epsilon neighborhood. If NULL, automatic estimation is done using insights of [Ultsch, 2005].
minPts	Number of minimum points in the eps region (for core points). In principle minimum number of points in the unit disk, if the unit disk is within the cluster (core) [Ester et al., 1996, p. 228]. if NULL, its 2.5 percent of points.
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in C1s

UpperLimitRadius Limit for radius search, experimental

... Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

..

Value

List of

Cls [1:n] numerical vector defining the clustering; this classification is the main output of the algorithm. Points which cannot be assigned to a cluster will be reported as members of the noise cluster with 0.

Object Object defined by clustering algorithm as the other output of this algorithm

```
data('Hepta')
out=SharedNearestNeighborClustering(
Hepta$Data,Radius=NULL,minPts=NULL,PlotIt = FALSE)
```

SOMclustering *self-organizing maps based clustering implemented by [Wherens, Buydens, 2017].*

Description

Either the variant k-batch or k-online is possible in which every unit can be seen approximately as an cluster.

Usage

```
SOMclustering(Data,LC=c(1,2),ClusterNo=NULL,
Mode="online",PlotIt=FALSE,rLen=100,alpha = c(0.05, 0.01),...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
LC	Lines and Columns of a very small SOM, usually every unit is a cluster, will be ignored if ClusterNo is not NULL.
ClusterNo	Optional, A number k which defines k different clusters to be built by the algorithm. LC will then be set accordingly.
Mode	Either "batch" or "online"
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in C1s
rLen	Please see supersom
alpha	Please see supersom
...	Further arguments to be set for the clustering algorithm in somgrid , if not set, default arguments are used.

Details

This clustering algorithm is based on very small maps and, hence, not emergent (c.f. [Thrun, 2018, p.37]). A 3x3 map means 9 units leading to 9 clusters.

Batch is a deterministic clustering approach whereas online is a stochastic clustering approach and research indicates that online should be preferred (c.f. [Thrun, 2018, p.37]).

Value

List of	
C1s	[1:n] numerical vector defining the classification as the main output of the clustering algorithm
Object	Object defined by clustering algorithm as the other output of this algorithm

```

SOTAclustering

SOTA Clustering

Description

Self-organizing Tree Algorithm (SOTA) introduced by [Herrero et al., 2001].

Usage

```
SOTAclustering(Data, ClusterNo,PlotIt=FALSE,UnrestGrowth,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in C1s
UnrestGrowth	TRUE: forces the ClusterNo option to uphold. FALSE: enables the algorithm to find its own number of clusters, in this cases ClusterNo should contain a high number because it is internally set as the number of iterations which is either reached or the max diversity criteria is satisfied priorly.
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Value

List of	
C1s	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
sotaObject	Object defined by clustering algorithm as the other output of this algorithm

Examples

```
#Does Work
data('Hepta')
out=SOTAClustering(Hepta$Data,ClusterNo=7)
table(Hepta$Cls,out$Cls)
```

```
#Does not work well
data('Lsun3D')
out=SOTAClustering(Lsun3D$Data,ClusterNo=100,PlotIt=FALSE,UnrestGrowth=FALSE)
```

SpectralClustering *Spectral Clustering*

Description

Clusters the Data into "ClusterNo" different clusters using the Spectral Clustering method

Usage

```
SpectralClustering(Data, ClusterNo,PlotIt=FALSE,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the algorithm.
PlotIt	default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used. e.g.: kernel : Kernelmethod, possible options: rbf \cdot Radial Basis kernel function "Gaussian" poly \cdot Polynomial kernel function vanilladot Linear kernel function tanhdot Hyperbolic tangent kernel function laplacedot Laplacian kernel function besseldot Bessel kernel function anovadot ANOVA RBF kernel function splinedot Spline kernel stringdot String kernel kpar : Kernelparameter: a character string or the list of hyper-parameters (kernel parameters). The default character string "automatic" uses a heuristic to determine a suitable value for the width parameter of the RBF kernel. "local"

(local scaling) uses a more advanced heuristic and sets a width parameter for every point in the data set. A list can also be used containing the parameters to be used with the kernel function.

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

out=SpectralClustering(Hepta$Data,ClusterNo=7,PlotIt=FALSE)
```

Spectrum

Fast Adaptive Spectral Clustering [John et al, 2020]

Description

Spectrum is a self-tuning spectral clustering method for single or multi-view data. In this wrapper restricted to the standard use in other clustering algorithms.

Usage

```
Spectrum(Data, Method = 2, ClusterNo = NULL,
PlotIt = FALSE, Silent = TRUE,PlotResults = FALSE, ...)
```

Arguments

Data	1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
Method	Method=1: default eigengap method (Gaussian clusters) Method=2: multimodality gap method (Gaussian/ non-Gaussian clusters) Method=3: Allows to setClusterNo

ClusterNo	Optional, A number k which defines k different clusters to be built by the algorithm. For default ClusterNo=NULL please see details.
PlotIt	Default: FALSE, If TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
Silent	Silent progress of algorithm=TRUE
PlotResults	Plots result of spectrum with plot function
...	Method: numerical value: 1 = default eigengap method (Gaussian clusters), 2 = multimodality gap method (Gaussian/ non-Gaussian clusters), 3 = no automatic method (see fixk param)
	Other parameters defined in Spectrum packages

Details

Spectrum is a partitioning algorithm and either uses the eigengap or multimodality gap heuristics to determine the number of clusters, please see Spectrum package for details

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

StatPDEdensity *Pareto Density Estimation*

Description

Density estimation for ggplot with a clear model behind it.

Format

The format is: Classes 'StatPDEdensity', 'Stat', 'ggproto' <ggproto object: Class StatPDEdensity, Stat> aesthetics: function compute_group: function compute_layer: function compute_panel: function default_aes: uneval extra_params: na.rm finish_layer: function non_missing_aes: parameters: function required_aes: x y retransform: TRUE setup_data: function setup_params: function super: <ggproto object: Class Stat>

Details

PDE was published in [Ultsch, 2005], short explanation in [Thrun, Ultsch 2018] and the PDE optimized violin plot was published in [Thrun et al., 2018].

References

SubspaceClustering *Algorithms for Subspace clustering*

Description

Subspace clustering is a technique which finds clusters within different subspaces (a selection of one or more dimensions)

Usage

```
SubspaceClustering(Data,ClusterNo,DimSubspace,
method='Orclus',PlotIt=FALSE,OrclusInitialClustersNo=ClusterNo+2,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases or d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the proclus or orclus algorithm.
DimSubspace	Numerical number defining the dimensionality in which clusters should be search in in the orclus algorithm, for proclus it is an optional parameter
method	'Orclus', subspace clustering based on arbitrarily oriented projected cluster generation [Aggarwal and Yu, 2000] 'ProClus' ProClus Algorithm for Projected Clustering [Aggarwal/Wolf, 1999] 'Clique' ProClus Algorithm for Projected Clustering [Agrawal et al., 1999] and [Agrawal et al., 2005] 'SubClu' ProClus Algorithm for Projected Clustering [Kailing et al.,2004]
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
OrclusInitialClustersNo	Only for Orclus algorithm: Initial number of clusters (that are computed in the entire data space) must be greater than k. The number of clusters is iteratively decreased by a factor until the final number of k clusters is reached.
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used. For Subclue: "epsilon" and "minSupport", see DBscan For Clique: "xi" (number of intervals for each dimension) and "tau" (Density Threshold), see DBscan

Details

"The underlying assumption is that we can find valid clusters which are defined by only a subset of dimensions (it is not needed to have the agreement of all N features). The resulting clusters may be overlapping both in the space of features and observations" [Source: URL].

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering.
Object	Object defined by clustering algorithm as the other output of this algorithm

Note

JAVA_HOME has to be set for rJava to the ProClus algorithm (in windows set PATH env. variable to ../bin path of Java. The architecture of R and Java have to match. Java automatically downloads the Java version of the browser which may not be installed in the architecture in R. In such a case choose a Java version manually.

Examples

```
data('Hepta')
out=SubspaceClustering(Hepta$Data,ClusterNo=7,PlotIt=FALSE)
```

TandemClustering *Tandem Clustering*

Description

Summarizes clustering methods that combine k-means and pca

Usage

```
TandemClustering(Data,ClusterNo,Type="Reduced",PlotIt=FALSE,...)
```

Arguments

Data	[1:n,1:d] matrix of dataset to be clustered. It consists of n cases of d-dimensional data points. Every case has d attributes, variables or features.
ClusterNo	A number k which defines k different clusters to be built by the algorithm.

Type	Reduced: Reduced k-means (RKM) [De Soete/Carroll, 1994]. Factorial: Factorial k-mean (FKM) [Vichi/Kiers, 2001] KernelPCA: Kernel PCA with minimum normalised cut hyperplanes [Hofmeyr/Pavlidis, 2019]
PlotIt	Default: FALSE, if TRUE plots the first three dimensions of the dataset with colored three-dimensional data points defined by the clustering stored in Cls
...	Further arguments to be set for the clustering algorithm, if not set, default arguments are used.

Details

If the ClusterNo exceeds the number of dimensions, than the function is called recursively with ClusterNo=2. In each iteration the cluster with the highest number of overall points is clustered again, until the number of clusters is met.

"KernelPCA" uses additionally the package kernlab and is implemented as given in the fifth example on page 18, section "extension" of [Hofmeyr/Pavlidis, 2019]

The first idea of using non-PCA projections for clustering was published by [Bock, 1987] as an definition. However, to the knowledge of the author it was not applied to any data. The first systematic comparison to Projection-Pursuit Methods [ProjectionPursuitClustering](#) and [AutomaticProjectionBasedClustering](#) can be found in [Thrun/Ultsch, 2018].

Value

List of	
Cls	[1:n] numerical vector with n numbers defining the classification as the main output of the clustering algorithm. It has k unique numbers representing the arbitrary labels of the clustering. Points which cannot be assigned to a cluster will be reported with 0.
Object	Object defined by clustering algorithm as the other output of this algorithm

Examples

```
data(Target)
str(Target)
```

Tetra	<i>Tetra introduced in [Ultsch, 1993]</i>
-------	---

Description

Almost touching clusters. Detailed description of dataset and its clustering challenge is provided in [Thrun/Ultsch, 2020].

Usage

```
data("Tetra")
```

Details

Size 400, Dimensions 3, stored in Tetra\$Data

Classes 4, stored in Tetra\$Cls

Examples

```
data(Tetra)
str(Tetra)
```

TwoDiamonds	<i>TwoDiamonds introduced in [Ultsch, 2003a, 2003b]</i>
-------------	---

Description

Cluster border defined by density. Detailed description of dataset and its clustering challenge is provided in [Thrun/Ultsch, 2020].

Usage

```
data("TwoDiamonds")
```

Details

Size 800, Dimensions 2, stored in TwoDiamonds\$Data

Classes 2, stored in TwoDiamonds\$Cls

Examples

```
data(TwoDiamonds)
str(TwoDiamonds)
```

WingNut

WingNut introduced in [Ultsch, 2005]

Description

Density vs. distance. Detailed description of dataset and its clustering challenge is provided in [Thrun/Ultsch, 2020].

Usage

```
data("WingNut")
```

Details

Size 1016, Dimensions 2, stored in WingNut\$Data

Classes 2, stored in WingNut\$Cls
