

Package ‘OutlierDetection’

June 15, 2019

Type Package

Title Outlier Detection

Version 0.1.1

Author Vinay Tiwari, Akanksha Kashikar

Maintainer Vinay Tiwari <vinaystiwari786@gmail.com>

Description To detect outliers using different methods namely model based outlier detection (Barnett, V. 1978 <<https://www.jstor.org/stable/2347159>>), distance based outlier detection (Hautamaki, V., Karkkainen, I., and Franti, P. 2004 <<http://cs.uef.fi/~franti/papers.html>>), dispersion based outlier detection (Jin, W., Tung, A., and Han, J. 2001 <https://link.springer.com/chapter/10.1007/0-387-25465-X_7>), depth based outlier detection (Johnson, T., Kwok, I., and Ng, R.T. 1998 <<http://www.aaai.org/Library/KDD/1998/kdd98-038.php>>) and density based outlier detection (Ester, M., Kriegel, H.-P., Sander, J., and Xu, X. 1996 <<https://dl.acm.org/citation.cfm?id=3001507>>). This package provides labelling of observations as outliers and outlierliness of each outlier. For univariate, bivariate and trivariate data, visualization is also provided.

Imports ggplot2, DDoutlier, depth, depthTools, ldbod, spatstat, plotly

dens	<i>Outlier detection using Robust Kernal-based Outlier Factor(RKOF) algorithm</i>
------	---

Description

Takes a dataset and finds its outliers using Robust Kernal-based Outlier Factor(RKOF) algorithm

Usage

```
dens(x, k = 0.05 * nrow(x), C = 1, alpha = 1, sigma2 = 1,
     cutoff = 0.95, rnames = F, boottimes = 100)
```

Arguments

x	dataset for which outliers are to be found
k	No. of nearest neighbours to be used, default value is 0.05*nrow(x)
C	Multiplication parameter for k-distance of neighboring observations. Act as bandwidth increaser. Default is 1 such that k-distance is used for the gaussian kernel
alpha	Sensivity parameter for k-distance/bandwidth. Small alpha creates small variance in RKOF and vice versa. Default is 1
sigma2	Variance parameter for weighting of neighboring observations
cutoff	Percentile threshold used for distance, default value is 0.95
rnames	Logical value indicating whether the dataset has rownames, default value is False
boottimes	Number of bootsrap samples to find the cutoff, default is 100 samples

Details

dens computes outlier score of an observation using DDoutlier package(based on RKOF algorithm) and based on the bootstrapped cutoff, labels an observation as outlier. Outlierliness of the labelled 'Outlier' is also reported and it is the bootstrap estimate of probability of the observation being an outlier. For bivariate data, it also shows the scatterplot of the data with labelled outliers.

Value

Outlier Observations: A matrix of outlier observations

Location of Outlier: Vector of Sr. no. of outliers

Outlier probability: Vector of proportion of times an outlier exceeds local bootstrap cutoff

Author(s)

Vinay Tiwari, Akanksha Kashikar

References

Examples

```
#Create dataset
X=iris[,1:4]
#Outlier detection
dens(X,k=4,C=1)
```

depthout

Outlier detection using depth based method

Description

Takes a dataset and finds its outliers using depth-based method

Usage

```
depthout(x, rnames = FALSE, cutoff = 0.05, boottimes = 100)
```

Arguments

x	dataset for which outliers are to be found
rnames	Logical value indicating whether the dataset has rownames, default value is False
cutoff	Percentile threshold used for depth, default value is 0.05
boottimes	Number of bootstrap samples to find the cutoff, default is 100 samples

Details

depthout computes depth of an observation using depthTools package and based on the bootstrapped cutoff, label an observation as outlier. Outlierliness of the labelled 'Outlier' is also reported and it is the bootstrap estimate of probability of the observation being an outlier. For bivariate data, it also shows the scatterplot of the data with labelled outliers.

Value

Outlier Observations: A matrix of outlier observations

Location of Outlier: Vector of Sr. no. of outliers

Outlier probability: Vector of proportion of times an outlier exceeds local bootstrap cutoff

Examples

```
#Create dataset
X=iris[,1:4]
#Outlier detection
depthout(X,cutoff=0.05)
```

 disp

Outlier detection using generalised dispersion

Description

Takes a dataset and finds its outliers using dispersion-based method

Usage

```
disp(x, cutoff = 0.95, rnames = FALSE, boottimes = 100)
```

Arguments

x	dataset for which outliers are to be found
cutoff	Percentile threshold used for distance, default value is 0.95
rnames	Logical value indicating whether the dataset has rownames, default value is False
boottimes	Number of bootstrap samples to find the cutoff, default is 100 samples

Details

disp computes LOO dispersion matrix for each observation (dispersion matrix without considering the current observation) and based on the bootstrapped cutoff for score (difference between determinant of LOO dispersion matrix and det of actual dispersion matrix), labels an observation as outlier. Outlierliness of the labelled 'Outlier' is also reported and it is the bootstrap estimate of probability of the observation being an outlier. For bivariate data, it also shows the scatterplot of the data with labelled outliers.

Value

Outlier Observations: A matrix of outlier observations

Location of Outlier: Vector of Sr. no. of outliers

Outlier probability: Vector of proportion of times an outlier exceeds local bootstrap cutoff

Author(s)

Vinay Tiwari, Akanksha Kashikar

Examples

```
#Create dataset
X=iris[,1:4]
#Outlier detection
disp(X,cutoff=0.99)
```

maha

Outlier detection using Mahalanobis Distance

Description

Takes a dataset and finds its outliers using modelbased method

Usage

```
maha(x, cutoff = 0.95, rnames = FALSE)
```

Arguments

x	dataset for which outliers are to be found
cutoff	Percentile threshold used for distance, default value is 0.95
rnames	Logical value indicating whether the dataset has rownames, default value is False

Details

maha computes Mahalanobis distance an observation and based on the Chi square cutoff, labels an observation as outlier. Outlierliness of the labelled 'Outlier' is also reported based on its p values. For bivariate data, it also shows the scatterplot of the data with labelled outliers.

Value

Outlier Observations: A matrix of outlier observations

Location of Outlier: vector of Sr. no. of outliers

Outlier probability: vector of (1-p value) of outlier observations

Author(s)

Vinay Tiwari, Akanksha Kashikar

References

Barnett, V. 1978. The study of outliers: purpose and model. *Applied Statistics*, 27(3), 242–250.

Examples

```
#Create dataset
X=iris[,1:4]
#Outlier detection
maha(X,cutoff=0.9)
```

 nn

Outlier detection using k Nearest Neighbours Distance method

Description

Takes a dataset and finds its outliers using distance-based method

Usage

```
nn(x, k = 0.05 * nrow(x), cutoff = 0.95, Method = "euclidean",
  rnames = FALSE, boottimes = 100)
```

Arguments

x	dataset for which outliers are to be found
k	No. of nearest neighbours to be used, default value is 0.05*nrow(x)
cutoff	Percentile threshold used for distance, default value is 0.95
Method	Distance method, default is Euclidean
rnames	Logical value indicating whether the dataset has rownames, default value is False
boottimes	Number of bootstrap samples to find the cutoff, default is 100 samples

Details

nn computes average knn distance of observation and based on the bootstrapped cutoff, labels an observation as outlier. Outlierliness of the labelled 'Outlier' is also reported and it is the bootstrap estimate of probability of the observation being an outlier. For bivariate data, it also shows the scatterplot of the data with labelled outliers.

Value

Outlier Observations: A matrix of outlier observations

Location of Outlier: Vector of Sr. no. of outliers

Outlier probability: Vector of proportion of times an outlier exceeds local bootstrap cutoff

Author(s)

Vinay Tiwari, Akanksha Kashikar

Examples

```
#Create dataset
X=iris[,1:4]
#Outlier detection
nn(X,k=4)
```

nnk

Outlier detection using kth Nearest Neighbour Distance method

Description

Takes a dataset and finds its outliers using distance-based method

Usage

```
nnk(x, k = 0.05 * nrow(x), cutoff = 0.95, Method = "euclidean",
    rnames = FALSE, boottimes = 100)
```

Arguments

x	dataset for which outliers are to be found
k	No. of nearest neighbours to be used, default value is $0.05 * \text{nrow}(x)$
cutoff	Percentile threshold used for distance, default value is 0.95
Method	Distance method, default is Euclidean
rnames	Logical value indicating whether the dataset has rownames, default value is False
boottimes	Number of bootstrap samples to find the cutoff, default is 100 samples

Details

nnk computes kth nearest neighbour distance of an observation and based on the bootstrapped cutoff, labels an observation as outlier. Outlierliness of the labelled 'Outlier' is also reported and it is the bootstrap estimate of probability of the observation being an outlier. For bivariate data, it also shows the scatterplot of the data with labelled outliers.

Value

Outlier Observations: A matrix of outlier observations

Location of Outlier: Vector of Sr. no. of outliers

Outlier probability: Vector of proportion of times an outlier exceeds local bootstrap cutoff

Author(s)

Vinay Tiwari, Akanksha Kashikar

References

Hautamaki, V., Karkkainen, I., and Franti, P. 2004. Outlier detection using k-nearest neighbour graph. In Proc. IEEE Int. Conf. on Pattern Recognition (ICPR), Cambridge, UK.

Examples

```
#Create dataset
X=iris[,1:4]
#Outlier detection
nnk(X,k=4)
```

OutlierDetection *Outlier Detection(Intersection of all the methods)*

Description

Takes a dataset and finds its outliers using combination of different method

Usage

```
OutlierDetection(x, k = 0.05 * nrow(x), cutoff = 0.95,
  Method = "euclidean", rnames = FALSE, depth = FALSE,
  dense = FALSE, distance = FALSE, dispersion = FALSE)
```

Arguments

x	dataset for which outliers are to be found
k	No. of nearest neighbours to be used for outlier detection using bootstrapping, default value is 0.05*nrow(x)
cutoff	Percentile threshold used for distance, default value is 0.95
Method	Distance method, default is Euclidean
rnames	Logical value indicating whether the dataset has rownames, default value is False
depth	Logical value indicating whether depth based method should be used or not, default is False
dense	Logical value indicating whether density based method should be used or not, default is False
distance	Logical value indicating whether distance based methods should be used or not, default is False
dispersion	Logical value indicating whether dispersion based methods should be used or not, default is False

Details

OutlierDetection finds outlier observations for the data using different methods and based on all the methods considered, labels an observation as outlier(intersection of all the methods). For bivariate data, it also shows the scatterplot of the data with labelled outliers.

Value

Outlier Observations: A matrix of outlier observations

Location of Outlier: Vector of Sr. no. of outliers

Author(s)

Vinay Tiwari, Akanksha Kashikar

Examples

```
OutlierDetection(iris[,-5])
```

PCOutlierDetection	<i>Principal Component Outlier Detection(Intersection of all the methods applied on pc's)</i>
--------------------	---

Description

Takes a dataset, and finds its outliers based on principal components using combination of different method

Usage

```
PCOutlierDetection(x, k = 0.05 * nrow(x), cutoff = 0.95,
  Method = "euclidean", rnames = FALSE, depth = FALSE,
  dense = FALSE, distance = FALSE, dispersion = FALSE,
  infocut = 0.9)
```

Arguments

x	dataset for which outliers are to be found
k	No. of nearest neighbours to be used for for outlier detection using bootstrapping, default value is 0.05*nrow(x)
cutoff	Percentile threshold used for distance, default value is 0.95
Method	Distance method, default is Euclidean
rnames	Logical value indicating whether the dataset has rownames, default value is False
depth	Logical value indicating whether depth based method should be used or not, default is False
dense	Logical value indicating whether density based method should be used or not, default is False
distance	Logical value indicating whether distance based methods should be used or not, default is False
dispersion	Logical value indicating whether dispersion based methods should be used or not, default is False
infocut	Amount of variation for deciding the no. of principal components to be retained in the analysis, default is 0.9

Details

OutlierDetection finds outlier observations for the principal component space using different methods and based on all the methods considered, labels an observation as outlier(intersection of all the methods). For bivariate data, it also shows the scatterplot of the data with labelled outliers.

Value

Outlier Observations: A matrix of outlier observations

Location of Outlier: Vector of Sr. no. of outliers

Author(s)

Vinay Tiwari, Akanksha Kashikar

Examples

```
PCOutlierDetection(iris[,-5])
```

UnivariateOutlierDetection

Univariate Outlier Detection(Intersection of all the methods)

Description

Takes a vector and finds its outliers using combination of different methods

Usage

```
UnivariateOutlierDetection(x, k = 0.05 * length(x), cutoff = 0.95,
  dist = FALSE, dens = FALSE, depth = FALSE, Method = "euclidean",
  rnames = FALSE)
```

Arguments

x	vector for which outliers are to be found
k	No. of nearest neighbours to be used for distance methods, default value is 0.05*nrow(x)
cutoff	Percentile threshold used for outlier detection using bootstrapping, default value is 0.95
dist	Logical value indicating whether distance based methods should be used or not, default is False
dens	Logical value indicating whether density based method should be used or not, default is False
depth	Logical value indicating whether depth based method should be used or not, default is False
Method	Distance method, default is euclidean
rnames	Logical value indicating whether the dataset has rownames, default value is False

Details

UnivariateOutlierDetection finds outlier observations for an univariate data using different methods and based on all the methods, labels an observation as outlier(intersection of all the methods). It also shows the scatterplot of the data with labelled outliers with observation no. as x-axis.

Value

Outlier Observations: A vector of outlier observations

Location of Outlier: Vector of Sr. no. of outliers

Author(s)

Vinay Tiwari, Akanksha Kashikar

Examples

```
#Create dataset
X=iris[,1:4]
#Outlier detection
depthout(X,cutoff=0.05)
UnivariateOutlierDetection(iris[,1],cutoff=.95,Method="euclidean",rnames=FALSE)
```
