Package 'PUlasso'

April 28, 2019

Type Package

Title High-Dimensional Variable Selection with Presence-Only Data

Version 3.2.3

Date 2019-4-25

Description Efficient algorithm for solving PU (Positive and Unlabeled) problem in low or high dimensional setting with lasso or group lasso penalty. The algorithm uses Maximization—Minorization and (block) coordinate descent. Sparse calculation and parallel computing are supported for the computational speed-up. See Hyebin Song, Garvesh Raskutti (2018) <arXiv:1711.08129>.

License GPL-2

Imports Rcpp (>= 0.12.8), methods, Matrix, doParallel, foreach, ggplot2

Depends R(>= 2.10)

LinkingTo Rcpp, RcppEigen, Matrix

RoxygenNote 6.1.1

Suggests testthat, knitr, rmarkdown

Description

The package efficiently solves PU problem in low or high dimensional setting using Maximization-Minorization and (block) coordinate descent. It allows simultaneous feature selection and parameter estimation for classification. Sparse calculation and parallel computing are supported for the further computational speed-up. See Hyebin Song, Garvesh Raskutti (2018) https://arxiv.org/abs/1711.08129.

Details

Main functions: grpPUlasso, cv.grpPUlasso, coef, predict

Examples

```
data("simulPU")
fit<-grpPUlasso(X=simulPU$X,z=simulPU$z,py1=simulPU$truePY1)
## Not run:
cvfit<-cv.grpPUlasso(X=simulPU$X,z=simulPU$z,py1=simulPU$truePY1)
## End(Not run)
coef(fit,lambda=fit$lambda[10])
predict(fit,newdata = head(simulPU$X), lambda= fit$lambda[10],type = "response")</pre>
```

cv.grpPUlasso 3

cv.grpPUlasso Cross-validation for PUlasso
--

Description

Do a n-fold cross-validation for PUlasso.

Usage

```
cv.grpPUlasso(X, z, py1, initial_coef = NULL, group = 1:p,
    penalty = NULL, lambda = NULL, nlambda = 100,
    lambdaMinRatio = ifelse(N < p, 0.05, 0.005), maxit = ifelse(method ==
    "CD", 1000, N * 10), weights = NULL, eps = 1e-04, inner_eps = 0.01,
    verbose = FALSE, stepSize = NULL, stepSizeAdjustment = NULL,
    batchSize = 1, updateFrequency = N, samplingProbabilities = NULL,
    method = c("CD", "GD", "SGD", "SVRG", "SAG"), nfolds = 10,
    fitInd = 1:nfolds, nCores = 1, trace = c("none", "param", "fVal",
    "all"))</pre>
```

Arguments

Response vector representing whether an observation is labeled or unlabeled. py1 True prevalence Pr(Y=1) initial_coef A vector representing an initial point where we start PUlasso algorithm from. A vector representing grouping of the coefficients. For the least ambiguity, it recommended if group is provided in the form of vector of consecutive ascending integers.	
initial_coef A vector representing an initial point where we start PUlasso algorithm from. A vector representing grouping of the coefficients. For the least ambiguity, it recommended if group is provided in the form of vector of consecutive ascendents.	
group A vector representing grouping of the coefficients. For the least ambiguity, it recommended if group is provided in the form of vector of consecutive ascend	
recommended if group is provided in the form of vector of consecutive ascend	
ing integers.	
penalty penalty to be applied to the model. Default is sqrt(group size) for each of the group.	he
lambda A user supplied sequence of lambda values. If unspecified, the function automatically generates its own lambda sequence based on nlambda and lambdaMir Ratio.	
nlambda The number of lambda values.	
lambdaMinRatio Smallest value for lambda, as a fraction of lambda.max which leads to the intercept only model.	r-
maxit Maximum number of iterations.	
weights observation weights. Default is 1 for each observation.	
eps Convergence threshold for the outer loop. The algorithm iterates until the maximum change in coefficients is less than eps in the outer loop.	Х-
inner_eps Convergence threshold for the inner loop. The algorithm iterates until the maximum change in coefficients is less than eps in the inner loop.	Х-
verbose A logical value. if TRUE, the function prints out the fitting process.	

4 cv.grpPUlasso

stepSize A step size for gradient-based optimization. if NULL, a step size is taken to be

stepSizeAdj/mean(Li) where Li is a Lipschitz constant for ith sample

stepSizeAdjustment

A step size adjustment. By default, adjustment is 1 for GD and SGD, 1/8 for

SVRG and 1/16 for SAG.

batchSize A batch size. Default is 1.

updateFrequency

An update frequency of full gradient for method == "SVRG"

samplingProbabilities

sampling probabilities for each of samples for stochastic gradient-based opti-

mization. if NULL, each sample is chosen proportionally to Li.

method Optimization method. Default is Coordinate Descent. CD for Coordinate De-

scent, GD for Gradient Descent, SGD for Stochastic Gradient Descent, SVRG for Stochastic Variance Reduction Gradient, SAG for Stochastic Averaging Gra-

dient.

nfolds Number of cross-validation folds to be created.

fitInd A vector of indices of cross-validation models which will be fitted. Default is to

fit the model for each of the cross-validation fold.

nCores Number of threads to be used for parallel computing. If nCores=0, it is set to be

(the number of processors available-1). Default value is 1.

trace An option for saving intermediate quantities when fitting a full dataset.

Value

cvm Mean cross-validation error

cvsd Estimate of standard error of cvm

cvcoef Coefficients for each of the fitted CV models

cvstdcoef Coefficients in a standardized scale for each of the fitted CV models

lambda The actual sequence of lambda values used.

lambda.min Value of lambda that gives minimum cvm.

lambda.1se The largest value of lambda such that the error is within 1 standard error of the minimum cvm.

PUfit A fitted PUfit object for the full data

Examples

```
data("simulPU")
```

 $fit <\!-\text{cv.grpPUlasso}(X=\text{simulPU}\$X,z=\text{simulPU}\$z,py1=\text{simulPU}\$truePY1)$

deviances 5

deviances Deviance

Description

Calculate deviances at provided coefficients

Usage

```
deviances(X, z, py1, coefMat, weights = NULL)
```

Arguments

Χ	Input matrix
Z	Response vector
py1	True prevalence Pr(Y=1)
coefMat	A coefficient matrix whose column corresponds to a set of coefficients
weights	observation weights. Default is 1 for each observation.

Value

deviances

Examples

```
data("simulPU")
coef0<-replicate(2,runif(ncol(simulPU$X)+1))
deviances(simulPU$X,simulPU$z,py1=simulPU$truePY1,coefMat = coef0)</pre>
```

grpPUlasso

Solve PU problem with lasso or group lasso penalty.

Description

Fit a model using PUlasso algorithm over a regularization path. The regularization path is computed at a grid of values for the regularization parameter lambda.

Usage

```
grpPUlasso(X, z, py1, initial_coef = NULL, group = 1:ncol(X),
   penalty = NULL, lambda = NULL, nlambda = 100,
   lambdaMinRatio = ifelse(N < p, 0.05, 0.005), maxit = ifelse(method ==
   "CD", 1000, N * 10), maxit_inner = 1e+05, weights = NULL,
   eps = 1e-04, inner_eps = 0.01, verbose = FALSE, stepSize = NULL,
   stepSizeAdjustment = NULL, batchSize = 1, updateFrequency = N,
   samplingProbabilities = NULL, method = c("CD", "GD", "SGD", "SVRG",
   "SAG"), trace = c("none", "param", "fVal", "all"))</pre>
```

6 grpPUlasso

Arguments

Input matrix; each row is an observation. Can be a matrix or a sparse matrix.
 Response vector representing whether an observation is labeled or unlabeled.

py1 True prevalence Pr(Y=1)

initial_coef A vector representing an initial point where we start PUlasso algorithm from.

group A vector representing grouping of the coefficients. For the least ambiguity, it is

recommended if group is provided in the form of vector of consecutive ascend-

ing integers.

penalty penalty to be applied to the model. Default is sqrt(group size) for each of the

group.

lambda A user supplied sequence of lambda values. If unspecified, the function auto-

matically generates its own lambda sequence based on nlambda and lambdaMin-

Ratio.

nlambda The number of lambda values.

lambdaMinRatio Smallest value for lambda, as a fraction of lambda.max which leads to the inter-

cept only model.

maxit Maximum number of iterations.

maxit_inner Maximum number of iterations for a quadratic sub-problem for CD.

weights observation weights. Default is 1 for each observation.

eps Convergence threshold for the outer loop. The algorithm iterates until the max-

imum change in coefficients is less than eps in the outer loop.

inner_eps Convergence threshold for the inner loop. The algorithm iterates until the max-

imum change in coefficients is less than eps in the inner loop.

verbose A logical value. if TRUE, the function prints out the fitting process.

stepSize A step size for gradient-based optimization. if NULL, a step size is taken to be

stepSizeAdj/mean(Li) where Li is a Lipschitz constant for ith sample

stepSizeAdjustment

A step size adjustment. By default, adjustment is 1 for GD and SGD, 1/8 for

SVRG and 1/16 for SAG.

batchSize A batch size. Default is 1.

updateFrequency

An update frequency of full gradient for method == "SVRG"

samplingProbabilities

sampling probabilities for each of samples for stochastic gradient-based opti-

mization. if NULL, each sample is chosen proportionally to Li.

method Optimization method. Default is Coordinate Descent. CD for Coordinate De-

scent, GD for Gradient Descent, SGD for Stochastic Gradient Descent, SVRG for Stochastic Variance Reduction Gradient, SAG for Stochastic Averaging Gra-

dient.

trace An option for saving intermediate quantities. All intermediate standardized-

scale parameter estimates(trace=="param"), objective function values at each iteration(trace=="fVal"), or both(trace=="all") are saved in optResult. Since this is computationally very heavy, it should be only used for decently small-sized

dataset and small maxit. A default is "none".

simulPU 7

Value

coef A p by length(lambda) matrix of coefficients

std_coef A p by length(lambda) matrix of coefficients in a standardized scale

lambda The actual sequence of lambda values used.

nullDev Null deviance defined to be 2*(logLik sat -logLik null)

deviance Deviance defined to be 2*(logLik_sat -logLik(model))

optResult A list containing the result of the optimization. fValues, subGradients contain objective function values and subgradient vectors at each lambda value. If trace = TRUE, corresponding intermediate quantities are saved as well.

iters Number of iterations(EM updates) if method = "CD". Number of steps taken otherwise.

Examples

```
data("simulPU")
fit<-grpPUlasso(X=simulPU$X,z=simulPU$z,py1=simulPU$truePY1)</pre>
```

simulPU

simulated PU data

Description

A simulated data for the illustration. Covariates x_i are drawn from $N(\mu, I_{5 \times 5})$ or $N(-\mu, I_{5 \times 5})$ with probability 0.5. To make the first two variables active, $\mu = [\mu_1, \dots, \mu_2, 0, 0, 0]^T$, $\theta = [\theta_0, \dots, \theta_2, 0, 0, 0]^T$ and we set $\mu_i = 1.5$, $\theta_i \sim Unif[0.5, 1]$ Responses y_i is simulated via $P_{\theta}(y = 1|x) = 1/exp(-\theta^T x)$. 1000 observations are sampled from the sub-population of positives(y=1) and labeled, and another 1000 observations are sampled from the original population and unlabeled.

Usage

simulPU

Format

A list containing model matrix X, true response y, labeled/unlabeled response vector z, and a true positive probability truePY1.
