

# Package ‘Rnumerai’

April 18, 2020

**Title** Interface to the Numerai Machine Learning Tournament API

**Version** 2.1

**Description** Routines to interact with the Numerai Machine Learning Tournament API <<https://numer.ai>>. The functionality includes the ability to automatically download the current tournament data, submit predictions, and to get information for your user. General 'GraphQL' queries can also be executed.

**Depends** R (>= 3.1)

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**URL** <https://github.com/Omni-Analytics-Group/Rnumerai>

**BugReports** <https://github.com/Omni-Analytics-Group/Rnumerai/issues>

**RoxygenNote** 7.1.0

**Imports** httr, lubridate, dplyr, tidyr, ggplot2, purrr

**NeedsCompilation** no

**Author** Omni Analytics Group [aut],  
Eric Hare [cre]

**Maintainer** Eric Hare <[eric@omnianalytics.io](mailto:eric@omnianalytics.io)>

**Repository** CRAN

**Date/Publication** 2020-04-18 04:10:05 UTC

## R topics documented:

<b>Index</b>	<b>17</b>

---

account_info	<i>Get information about your account</i>
--------------	---

---

## Description

Get information about your account

## Usage

```
account_info()
```

## Value

A list containing information about account

## Examples

```
## Not run:
ainfo <- account_info()
names(ainfo)
ainfo$Latest_Submission

## End(Not run)
```

---

current_round	<i>Get current round and it's closing time</i>
---------------	--

---

**Description**

Get current round and it's closing time

**Usage**

```
current_round(tournament = "Kazutsugi")
```

**Arguments**

tournament      The name of the tournament, Default is Kazutsugi and is not case-sensitive

**Value**

Returns the current round number and it's closing times

**Examples**

```
## Not run:  
current_round()  
  
## End(Not run)
```

---

download_data	<i>Function to download the Numerai Tournament data</i>
---------------	---

---

**Description**

Function to download the Numerai Tournament data

**Usage**

```
download_data(location = tempdir(), tournament = "KAZUTSUGI")
```

**Arguments**

location      The directory path in which to store the data  
tournament      The name of the tournament, Default is KAZUTSUGI and is not case-sensitive. Since at the moment the datasets are same for all tournaments this parameter can be left blank.

**Value**

A list containing the training and tournament data objects

**Examples**

```
## Not run:
## Directory where data files and prediction files to be saved
## Put custom directory path or use the current working directory
data_dir <- tempdir()

## Download data set for current competition
data <- download_data(data_dir,tournament="KAZUTSUGI")
data_train <- data$data_train
data_tournament <- data$data_tournament

## End(Not run)
```

---

get_api_key	<i>Gets the Numerai API key</i>
-------------	---------------------------------

---

**Description**

Gets the Numerai API key

**Usage**

```
get_api_key()
```

**Value**

Your Numerai API key, if set

**Examples**

```
## Not run:
get_api_key()

## End(Not run)
```

---

get_models	<i>Get models associated with your account</i>
------------	--

---

**Description**

Get models associated with your account

**Usage**

```
get_models()
```

**Value**

A list containing information about the models

**Examples**

```
## Not run:  
models <- get_models()  
  
## End(Not run)
```

---

get_password	<i>Gets the Numerai Password</i>
--------------	----------------------------------

---

**Description**

Gets the Numerai Password

**Usage**

```
get_password()
```

**Value**

Your Numerai Password, if set

**Examples**

```
## Not run:  
get_password()  
  
## End(Not run)
```

---

get_public_id	<i>Gets the Numerai Public ID</i>
---------------	-----------------------------------

---

**Description**

Gets the Numerai Public ID

**Usage**

```
get_public_id()
```

**Value**

Your Numerai Public ID, if set

**Examples**

```
## Not run:
get_public_id()

## End(Not run)
```

---

get_valid_data	<i>Get the valid dataset for a particular metric</i>
----------------	--

---

**Description**

Get the valid dataset for a particular metric

**Usage**

```
get_valid_data(username, metric, merge = FALSE, round_aggregate = TRUE)
```

**Arguments**

username	A vector of one or more usernames
metric	Based on the metric selected, get the correct data
merge	If TRUE, merge the results into a single username
round_aggregate	If TRUE, aggregate the submission data by round

---

leaderboard	<i>Get Current leaderboard</i>
-------------	--------------------------------

---

**Description**

Get Current leaderboard

**Usage**

```
leaderboard()
```

**Value**

List containing leaderboard

**Examples**

```
## Not run:
leaderboard()

## End(Not run)
```

---

`performance_distribution`*Get the performance of the user as a distribution*

---

**Description**

Get the performance of the user as a distribution

**Usage**

```
performance_distribution(  
  username,  
  metric,  
  merge = FALSE,  
  round_aggregate = TRUE  
)
```

**Arguments**

<code>username</code>	A vector of one or more usernames
<code>metric</code>	A statistic, as a character vector.
<code>merge</code>	If TRUE, combine the usernames into a single result
<code>round_aggregate</code>	If TRUE, aggregate the submission data by round

---

`performance_over_time` *Get the performance of the user over time*

---

**Description**

Get the performance of the user over time

**Usage**

```
performance_over_time(  
  username,  
  metric,  
  merge = FALSE,  
  outlier_cutoff = if (round_aggregate) 0 else 0.0125,  
  round_aggregate = TRUE  
)
```

**Arguments**

username	A vector of one or more usernames
metric	A statistic, as a character vector.
merge	If TRUE, combine the usernames into a single result
outlier_cutoff	The absolute value above which points will be displayed
round_aggregate	If TRUE, aggregate the submission data by round

---

release_nmr	<i>Release NMR</i>
-------------	--------------------

---

**Description**

Release NMR

**Usage**

```
release_nmr(value, model_id = NULL, mfa_code = "", password = "")
```

**Arguments**

value	The amount of NMR to release
model_id	The id of the model with which to stake
mfa_code	The mfa code
password	Your password

**Value**

The transaction hash for release request

**Examples**

```
## Not run:
release_tx_hash <- release_nmr(value = 1)

## End(Not run)
```

---

round_stats	<i>Get Information for a Round Number</i>
-------------	---

---

**Description**

Get Information for a Round Number

**Usage**

```
round_stats(round_number, tournament = "Kazutsugi")
```

**Arguments**

round_number	Round Number for which information to fetch
tournament	The name of the tournament, Default is Kazutsugi and is not case-sensitive

**Value**

List containing general round information

**Examples**

```
## Not run:  
round_stats(round_number=177)  
  
## End(Not run)
```

---

run_query	<i>Function to run a raw GraphQL query on the API interface</i>
-----------	---

---

**Description**

Function to run a raw GraphQL query on the API interface

**Usage**

```
run_query(query, id = get_public_id(), key = get_api_key())
```

**Arguments**

query	The graphql query to run on the API as a string in single quotes
id	The public id of the Numerai application
key	The Numerai API key

**Value**

The parsed json content returned from the request

**Examples**

```
## Not run:
## Run Custom GraphQL code from R
custom_query <- "query queryname {
  rounds (number:82) {
    closeTime
  }
}"
run_query(query=custom_query)$data

## End(Not run)
```

---

set_api_key	<i>Sets the Numerai API key</i>
-------------	---------------------------------

---

**Description**

Sets the Numerai API key

**Usage**

```
set_api_key(key)
```

**Arguments**

key	The Numerai API key
-----	---------------------

**Value**

A boolean TRUE if the key was successfully set

**Examples**

```
## Not run:
set_api_key("abcdefghijklmnop")

## End(Not run)
```

---

set_password	<i>Sets the Numerai Password</i>
--------------	----------------------------------

---

**Description**

Sets the Numerai Password

**Usage**

```
set_password(pass)
```

**Arguments**

pass	The Numerai Password
------	----------------------

**Value**

A boolean TRUE if the password was successfully set

**Examples**

```
## Not run:  
set_password("abcdefghijklmnop")  
  
## End(Not run)
```

---

set_public_id	<i>Sets the Numerai Public ID</i>
---------------	-----------------------------------

---

**Description**

Sets the Numerai Public ID

**Usage**

```
set_public_id(id)
```

**Arguments**

id	The Numerai Public ID
----	-----------------------

**Value**

A boolean TRUE if the ID was successfully set

## Examples

```
## Not run:  
set_public_id("abcdefghijklmnop")  
  
## End(Not run)
```

---

stake\_nmr

*Stake NMR*

---

## Description

Stake NMR

## Usage

```
stake_nmr(value, model_id = NULL, mfa_code = "", password = "")
```

## Arguments

value	The amount of NMR to stake
model_id	The id of the model with which to stake
mfa_code	The mfa code
password	Your password

## Value

The transaction hash for stake made

## Examples

```
## Not run:  
stake_tx_hash <- stake_nmr(value = 1)  
  
## End(Not run)
```

---

`status_submission_by_id`*Get information about a submission from a submission id*

---

**Description**

Get information about a submission from a submission id

**Usage**

```
status_submission_by_id(sub_id)
```

**Arguments**

sub\_id            The id of the submission

**Value**

A list containing information about the given submission id

**Examples**

```
## Not run:  
status_submission_by_id(submission_id)  
  
## End(Not run)
```

---

`submit_predictions`*Function to submit the Numerai Tournament predictions*

---

**Description**

Function to submit the Numerai Tournament predictions

**Usage**

```
submit_predictions(  
  submission,  
  model_id = NULL,  
  location = tempdir(),  
  tournament = "Kazutsugi"  
)
```

**Arguments**

submission	The data frame of predictions to submit. This should have two columns named "id" & "prediction_kazutsugi"
model_id	Target model UUID (required for accounts with multiple models)
location	The location in which to store the predictions
tournament	The name of the tournament, Default is Kazutsugi and is not case-sensitive

**Value**

The submission id for the submission made

**Examples**

```
## Not run:
submission_id <- submit_predictions(submission_data, tournament="Kazutsugi")

## End(Not run)
```

---

summary\_statistics     *Get the summary statistics for*

---

**Description**

Get the summary statistics for

**Usage**

```
summary_statistics(username, dates = NULL, round_aggregate = TRUE)
```

**Arguments**

username	A vector of one or more usernames
dates	A vector of one or more dates to consider. If NULL, use all data
round_aggregate	If TRUE, aggregate the submission data by round

---

user_info	<i>Get information about your username</i>
-----------	--

---

**Description**

Get information about your username

**Usage**

```
user_info(model_id = NULL)
```

**Arguments**

model\_id      The id of the model

**Value**

A list containing information about user

**Examples**

```
## Not run:  
uinfo <- user_info()  
names(uinfo)  
uinfo$Latest_Submission  
  
## End(Not run)
```

---

user_performance	<i>Get User Performance</i>
------------------	-----------------------------

---

**Description**

Get User Performance

**Usage**

```
user_performance(user_name = "theomniacs")
```

**Arguments**

user\_name      UserName for which performance metrics to get

**Value**

Get User Performance

**Examples**

```
## Not run:  
user_performance(user_name="theomniacs")  
  
## End(Not run)
```

---

user\_performance\_data *Get the performance of the user over time*

---

**Description**

Get the performance of the user over time

**Usage**

```
user_performance_data(username, dates = NULL, round_aggregate = TRUE)
```

**Arguments**

username	A vector of one or more usernames
dates	A vector of one or more dates to consider. If NULL, use all data
round_aggregate	If TRUE, aggregate the submission data by round
