Package 'SUMMER'

July 10, 2020

Type Package

Title Spatio-Temporal Under-Five Mortality Methods for Estimation

Version 1.0.0

Date 2020-07-08

Description Provides methods for spatial and spatio-temporal smoothing of demographic and health indicators using survey data, with particular focus on estimating and projecting under-five mortality rates, described in Mercer et al. (2015) <doi:10.1214/15-AOAS872> and Li et al. (2019) <doi:10.1371/journal.pone.0210645>.

R topics documented:

SUMMER-package *SUMMER package documentation.*

Description

SUMMER provides methods for spatial and spatio-temporal smoothing of demographic and health indicators using survey data, with particular focus on estimating and projecting under-five mortality rates.

Details

For details on the model implemented in this package, see Mercer et al. (2015) <doi:10.1214/15-AOAS872> and Li et al. (2019) <doi:10.1371/journal.pone.0210645>.

The development version of the package will be maintained on https://github.com/richardli/SUMMER.

aggregateSurvey *Aggregate estimators from different surveys.*

Description

Aggregate estimators from different surveys.

Usage

```
aggregateSurvey(data)
```

Arguments

data	Output from getDirectList

Value

Estimators aggregated across surveys.

Author(s)

Zehang Richard Li

Examples

```
## Not run:
data(DemoData)
data(DemoMap)
years <- levels(DemoData[[1]]$time)

# obtain direct estimates
data <- getDirectList(births = DemoData,
years = years,
regionVar = "region", timeVar = "time",
clusterVar = "~clustid+id",
ageVar = "age", weightsVar = "weights",
geo.recode = NULL)

# obtain maps
geo <- DemoMap$geo
mat <- DemoMap$Amat

# Simulate hyper priors
priors <- simhyper(R = 2, nsamp = 1e+05, nsamp.check = 5000, Amat = mat, only.iid = TRUE)

# combine data from multiple surveys
data <- aggregateSurvey(data)
utils::head(data)

## End(Not run)
```

BRFSS *The BRFSS dataset*

Description

The Behavioral Risk Factor Surveillance System (BRFSS) is an annual telephone health survey conducted by the Centers for Disease Control and Prevention (CDC) that tracks health conditions and risk behaviors in the United States and its territories since 1984. This BRFSS dataset contains 16124 observations. The 'diab2' variable is the binary indicator of Type II diabetes, 'strata' is the strata indicator and 'rwt_llcp' is the final design weight. Records with missing HRA code or diabetes status are removed from this dataset. See http://www.cdc.gov/brfss/annual_data/2013/pdf/Weighting_Data.pdf for more details of the weighting procedure.

Usage

```
data(BRFSS)
```

Format

A data.frame of 26 variables.

ChangeRegion *Map region names to a common set.*

Description

Map region names to a common set.

Usage

```
ChangeRegion(data, Bmat, regionVar = "region")
```

Arguments

data	Preprocessed data
Bmat	Matrix of changes. Each row corresponds to a region name possibly in the data files, and each column corresponds to a region after mapping. The values in the matrix are binary. The row names and column names need to be specified to the region names.
regionVar	String indicating the region variable. Defaults to 'region'.

Value

Data after changing region names

Author(s)

Zehang Richard Li

Examples

```
# Construct a small test data
testdata <- data.frame(region = c("north", "south", "east",
 "south", "east"), index = c(1:5))

# Construct a changing rule: combining south and east
Bmat <- matrix(c(1, 0, 0, 0, 1, 1), 3, 2)
colnames(Bmat) <- c("north", "south and east")
rownames(Bmat) <- c("north", "south", "east")
print(Bmat)

# New data after transformation
test <- ChangeRegion(testdata, Bmat, "region")
print(test)
```

DemoData — *Simulated child mortality person-month dataset.*

Description

A small simulated dataset with 4 regions and 5 survey years. This does not represent any real country's data and are based on a subset of the model dataset provided by DHS.

Usage

```
data(DemoData)
```

Format

A list of with five components, named by survey year.

Source

https://dhsprogram.com/data/model-datasets.cfm

DemoData2 — *Simulated dataset for prevalence mapping.*

Description

A small fake dataset with 8 regions and two response variables: age and tobacco.use. This does not represent any real country's data and are based on a subset of the model dataset provided by DHS.

Usage

```
data(DemoData2)
```

Format

A data.frame of 7 variables.

Source

https://dhsprogram.com/data/model-datasets.cfm

DemoMap *Uganda Admin-1 region map for illustration purpose*

Description

Shapefiles are from 1995 Uganda Admin 1 regions provided by DHS, but the data do not represent real information about any country.

Usage

```
data(DemoMap)
```

Format

An object of class `list` of length 2.

Details

- geo. Geographic map files
- Amat. Adjacency matrix for regions

Source

https://spatialdata.dhsprogram.com/boundaries/#view=table&countryId=UG

DemoMap2 *Kenya Admin-1 region map for illustration purpose*

Description

Shapefiles are from 2014 Kenya Admin 1 regions provided by DHS.

Usage

```
data(DemoMap2)
```

Format

An object of class `list` of length 2.

Details

- geo Geographic map files
- Amat Adjacency matrix for regions

Source

https://spatialdata.dhsprogram.com/boundaries/#view=table&countryId=KE

expit *Expit transformation*

Description

Expit transformation

Usage

```
expit(x)
```

Arguments

x	data

Value

expit of x

Examples

```
x <- .5
expit(x)
```

getAdjusted *Adjust direct estimates and their associated variances*

Description

Adjust direct estimates and their associated variances

Usage

```
getAdjusted(data, ratio, time = "years", region = "region",
  est = "mean", logit = "logit.est", logit.var = "var.est",
  logit.prec = "logit.prec", logit.lower = "lower",
  logit.upper = "upper", prob.lower = NULL, prob.upper = NULL,
  adj = "ratio", verbose = FALSE, lower = NULL, upper = NULL)
```

Arguments

`data`	data frame of the adjusted estimates and the associated uncertainties, see the arguments below for specific columns.
`ratio`	the ratio of unadjusted mortality rates to the true mortality rates. It can be either a data frame with the following three columns (region, time, and adj) if adjustment factor differ by region; or a data frame with the following two columns (time and adj) if adjustment factor only varies over time. The column names specifying region, time and ratio, and adjustment are specified by the arguments in the function call.
`time`	the column name for time in the data and adjustment ratio.
`region`	the column name for region in the data and adjustment ratio.
`est`	the column name for unadjusted mortality rates in the data
`logit`	the column name for the logit of the unadjusted mortality rates in the data
`logit.var`	the column name for the variance of the logit of the unadjusted mortality rates in the data
`logit.prec`	the column name for the precision of the logit of the unadjusted mortality rates in the data
`logit.lower`	the column name for the 95% lower bound of the logit of the unadjusted mortality rates in the data
`logit.upper`	the column name for the 95% lower bound of the logit of the unadjusted mortality rates in the data
`prob.lower`	the column name for the 95% lower bound of the unadjusted mortality rates in the data. If this is provided instead of logit.lower, the logit scale lower bound will be created.
`prob.upper`	the column name for the 95% lower bound of the unadjusted mortality rates in the data. if this is provided instead of logit.upper, the logit scale upper bound will be created.
`adj`	the column name for the adjustment ratio
`verbose`	logical indicator for whether to print out unadjusted row index
`lower`	previous argument name for prob.lower. Will be removed in the next update
`upper`	previous argument name for prob.upper. Will be removed in the next update

Value

adjusted dataset of the same columns.

Author(s)

Zehang Richard Li

Examples

```
## Not run:
years <- levels(DemoData[[1]]$time)

# obtain direct estimates
data <- getDirectList(births = DemoData,
years = years,
regionVar = "region", timeVar = "time",
clusterVar = "~clustid+id",
ageVar = "age", weightsVar = "weights",
geo.recode = NULL)
# obtain direct estimates
data_multi <- getDirectList(births = DemoData, years = years,
  regionVar = "region",  timeVar = "time", clusterVar = "~clustid+id",
  ageVar = "age", weightsVar = "weights", geo.recode = NULL)
data <- aggregateSurvey(data_multi)

# randomly simulate adjustment factor
adj <- expand.grid(region = unique(data$region), years = years)
adj$ratio <- runif(dim(adj)[1], min = 0.5, max = 0.8)
data.adj <- getAdjusted(data = data, ratio = adj)

## End(Not run)
```

---

getAmat *Extract adjacency matrix from the map*

Description

Extract adjacency matrix from the map

Usage

```
getAmat(geo, names)
```

Arguments

geo	SpatialPolygonsDataFrame of the map
names	character vector of region ids to be added to the neighbours list

Value

Spatial djacency matrix.

Author(s)

Zehang Richard Li

Examples

```
data(DemoMap)
mat <- getAmat(geo = DemoMap$geo, names = DemoMap$geo$REGNAME)
mat
DemoMap$Amat
```

`getBirths` *Reformat full birth records into person-month format*

Description

Reformat full birth records into person-month format

Usage

```
getBirths(filepath = NULL, data = NULL, surveyyear = NA,
  variables = c("caseid", "v001", "v002", "v004", "v005", "v021", "v022",
  "v023", "v024", "v025", "v139", "bidx"), strata = c("v024", "v025"),
  dob = "b3", alive = "b5", age = "b7", date.interview = "v008",
  month.cut = c(1, 12, 24, 36, 48, 60), year.cut = seq(1980, 2020, by =
  5), min.last.period = 0, cmc.adjust = 0, compact = FALSE,
  compact.by = c("v001", "v024", "v025", "v005"))
```

Arguments

`filepath`	file path of raw .dta file from DHS. Only used when data frame is not provided in the function call.
`data`	data frame of a DHS survey
`surveyyear`	year of survey. Since version 0.3.0, this argument does not truncate observations. The truncation of person-month is based on year.cut and min.last.period.
`variables`	vector of variables to be used in obtaining the person-month files. The variables correspond the the DHS recode manual VI. For early DHS data, the variable names may need to be changed.
`strata`	vector of variable names used for strata. If a single variable is specified, then that variable will be used as strata indicator If multiple variables are specified, the interaction of these variables will be used as strata indicator.
`dob`	variable name for the date of birth.
`alive`	variable name for the indicator of whether child was alive or dead at the time of interview.
`age`	variable name for the age at death of the child in completed months.
`date.interview`	variable name for the date of interview.
`month.cut`	the cutoff of each bins of age group in the unit of months. Default values are 1, 12, 24, 36, 48, and 60, representing the age groups (0, 1), [1, 12), [12, 24), ..., [48, 60).

`year.cut` The cutoff of each bins of time periods, including both boundaries. Default values are 1980, 1985, ..., 2020, representing the time periods 80-84, 85-89, ..., 15-19. Notice that if each bin contains one year, the last year in the output is max(year.cut)-1. For example, if year.cut = 1980:2020, the last year in the output is 2019.

`min.last.period` The cutoff for how many years the last period must contain in order to be counted in the output. For example, if the last period is 2015-2019 and min.last.period = 3, person-months for the last period will only be returned if survey contains observations at least in 2017. This argument avoids the situation that estimates for the last period being based on only a small number of initial years, if applicable. Default to be 0.

`cmc.adjust` number of months to add to the recorded month in the dataset. Some DHS surveys does not use Gregorian calendar (the calendar used in most of the world). For example, the Ethiopian calendar is 92 months behind the Gregorian calendar in general. Then we can set cmc.adjust to 92, which adds 92 months to all dates in the dataset, effectively transforming the Ethiopian calendar to the Gregorian calendar.

`compact` logical indicator of whether the compact format is returned. In the compact output, person months are aggregated by cluster, age, and time. Total number of person months and deaths in each group are returned instead of the raw person-months.

`compact.by` vector of variables to summarize the compact form by.

Value

This function returns a new data frame where each row indicate a person-month, with the additional variables specified in the function argument.

getCounts *Aggregate person-month data into counts and totals by groups.*

Description

Aggregate person-month data into counts and totals by groups.

Usage

```
getCounts(data, variables, by, ignore = NULL, addtotal = TRUE,
  drop = TRUE)
```

Arguments

data	dataset in person-month format
variables	a character vector of the variables to aggregate
by	a character vector of columns that specifies which groups to aggregate by.
ignore	list of conditions not to impute 0. If left unspecified, any group levels not in the data will be imputed to have 0 counts.
addtotal	logical indicator of whether to add a column of group total counts.
drop	logical indicator of whether to drop all rows with total = 0.

Value

data.frame of the ggregated counts.

Author(s)

Zehang Richard Li

Examples

```
# a toy dataset with 4 time periods but one missing in data
timelist <- factor(1:4)
data = data.frame(died = c(0,0,0,1,1,0,0),
area = c(rep(c("A", "B"), 3), "A"),
time = timelist[c(1,1,2,3,3,3,3)])
data
# without ignore argument, all levels will be imputed
getCounts(data, variables = "died", by = c("area", "time"))
```

```
# ignoring time = 4, the ignored level will not be imputed (but still in the output)
getCounts(data, variables = "died", by = c("area", "time"),
ignore = list("time"=c(4)) )
```

---

getDiag *Extract posterior summaries of random effects*

Description

Extract posterior summaries of random effects

Usage

```
getDiag(inla_mod, field = c("space", "time", "spacetime")[1],
  CI = 0.95, draws = NULL, ...)
```

Arguments

inla_mod	output from smoothDirect
field	which random effects to plot. It can be one of the following: space, time, and spacetime.
CI	Desired level of credible intervals
draws	Posterior samples drawn from the fitted model. This argument allows the previously sampled draws (by setting save.draws to be TRUE) be used in new aggregation tasks.
...	Unused arguments, for users with fitted object from the package before v1.0.0, arguments including Amat, year_label, and year_range can still be specified manually.

Value

List of diagnostic plots

Author(s)

Zehang Richard Li

Examples

```
## Not run:
  data(DemoMap)
  years <- levels(DemoData[[1]]$time)

  # obtain direct estimates
  data <- getDirectList(births = DemoData,
```

```
  years = years,
  regionVar = "region", timeVar = "time",
  clusterVar = "~clustid+id",
  ageVar = "age", weightsVar = "weights",
  geo.recode = NULL)
  # obtain direct estimates
  data_multi <- getDirectList(births = DemoData, years = years,
    regionVar = "region",  timeVar = "time", clusterVar = "~clustid+id",
    ageVar = "age", weightsVar = "weights", geo.recode = NULL)
  data <- aggregateSurvey(data_multi)

  #  national model
  years.all <- c(years, "15-19")
  fit1 <- smoothDirect(data = data, geo = DemoMap$geo, Amat = DemoMap$Amat,
    year_label = years.all, year_range = c(1985, 2019),
    rw = 2, is.yearly=FALSE, m = 5)
random.time <- getDiag(fit1, field = "time")
  random.space <- getDiag(fit1, field = "space")
  random.spacetime <- getDiag(fit1, field = "spacetime")

## End(Not run)
```

`getDirect` *Obtain the Horvitz-Thompson direct estimates and standard errors using delta method for a single survey.*

Description

Obtain the Horvitz-Thompson direct estimates and standard errors using delta method for a single survey.

Usage

```
getDirect(births, years, regionVar = "region", timeVar = "time",
  clusterVar = "~v001+v002", ageVar = "age", weightsVar = "v005",
  Ntrials = NULL, geo.recode = NULL, national.only = FALSE)
```

Arguments

`births`	A matrix child-month data from `getBirths`
`years`	String vector of the year intervals used
`regionVar`	Variable name for region in the input births data.
`timeVar`	Variable name for the time period indicator in the input births data.
`clusterVar`	Variable name for cluster, typically '~v001 + v002'
`ageVar`	Variable name for age group. This variable need to be in the form of "a-b" where a and b are both ages in months. For example, "1-11" means age between 1 and 11 months, including both end points. An exception is age less than one month can be represented by "0" or "0-0".

weightsVar	Variable name for sampling weights, typically 'v005'
Ntrials	Variable for the total number of person-months if the input data (births) is in the compact form.
geo.recode	The recode matrix to be used if region name is not consistent across different surveys. See ChangeRegion.
national.only	Logical indicator to obtain only the national estimates

Value

a matrix of period-region summary of the Horvitz-Thompson direct estimates by region and time period specified in the argument, the standard errors using delta method for a single survey, the 95% confidence interval, and the logit of the estimates.

Author(s)

Zehang Richard Li, Bryan Martin, Laina Mercer

getDirectList

Examples

```
## Not run:
data(DemoData)
years <- c("85-89", "90-94", "95-99", "00-04", "05-09", "10-14")
mean <- getDirect(births = DemoData[[1]],  years = years,
regionVar = "region", timeVar = "time", clusterVar = "~clustid+id",
ageVar = "age", weightsVar = "weights", geo.recode = NULL)

## End(Not run)
```

getDirectList *Obtain the Horvitz-Thompson direct estimates and standard errors using delta method for multiple surveys.*

Description

Obtain the Horvitz-Thompson direct estimates and standard errors using delta method for multiple surveys.

Usage

```
getDirectList(births, years, regionVar = "region", timeVar = "time",
  clusterVar = "~v001+v002", ageVar = "age", weightsVar = "v005",
  Ntrials = NULL, geo.recode = NULL, national.only = FALSE)
```

Arguments

births	A list of child-month data from multiple surveys from getBirths. The name of the list is used as the identifier in the output.
years	String vector of the year intervals used
regionVar	Variable name for region, typically 'v024', for older surveys might be 'v101'
timeVar	Variable name for the time period indicator in the input births data.
clusterVar	Variable name for the IDs in the second-stage cluster sampling, typically '~v001 + v002', i.e., the cluster number and household number. When no cluster sampling design exists, this variable usually is the household ID.
ageVar	Variable name for age group. This variable need to be in the form of "a-b" where a and b are both ages in months. For example, "1-11" means age between 1 and 11 months, including both end points. An exception is age less than one month can be represented by "0" or "0-0".
weightsVar	Variable name for sampling weights, typically 'v005'
Ntrials	Variable for the total number of person-months if the input data (births) is in the compact form.
geo.recode	The recode matrix to be used if region name is not consistent across different surveys. See ChangeRegion.
national.only	Logical indicator to obtain only the national estimates

Value

This is the extension to the getDirect function that returns estimates from multiple surveys. Additional columns in the output (survey and surveyYears) specify the estimates from different surveys.

ageVar = "age", weightsVar = "weights", geo.recode = NULL)

## End(Not run)
```

---

getSmoothed *Extract smoothed estimates.*

Description

Extract smoothed estimates.

Usage

```
getSmoothed(inla_mod, nsim = 1000, weight.strata = NULL,
  weight.frame = NULL, verbose = FALSE, mc = 0,
  include_time_unstruct = FALSE, CI = 0.95, draws = NULL,
  save.draws = FALSE, include_subnational = TRUE, ...)
```

Arguments

inla_mod	output from smoothDirect or smoothCluster
nsim	number of simulations, only applicable for the cluster-level model.
weight.strata	a data frame with three columns, years, region, and proportion of each strata for the corresponding time period and region. This argument specifies the weights for strata-specific estimates on the probability scale.

`weight.frame` a data frame with three columns, years, region, and the weight of each frame for the corresponding time period and region. This argument specifies the weights for frame-specific estimates on the logit scale. Notice this is different from weight.strata argument.

`verbose` logical indicator whether to print progress messages from inla.posterior.sample.

`mc` number of monte carlo draws to approximate the marginal prevalence/hazards for binomial model. If mc = 0, analytical approximation is used. The analytical approximation is invalid for hazard modeling with more than one age groups.

`include_time_unstruct`
Indicator whether to include the temporal unstructured effects (i.e., shocks) in the smoothed estimates. Default is FALSE which excludes all unstructured temporal components. If set to TRUE all the unstructured temporal random effects will be included. Alternatively, if this is specified as a vector of subset of year labels (as in the year_label argument), only the unstructured terms in the corresponding time periods will be added to the prediction.

`CI` Desired level of credible intervals

`draws` Posterior samples drawn from the fitted model. This argument allows the previously sampled draws (by setting save.draws to be TRUE) be used in new aggregation tasks.

`save.draws` Logical indicator whether the raw posterior draws will be saved. Saved draws can be used to accelerate aggregations with different weights.

`include_subnational`
logical indicator whether to include the spatial and space-time interaction components in the smoothed estimates. If set to FALSE, only the main temporal trends are returned.

`...` Unused arguments, for users with fitted object from the package before v1.0.0, arguments including Amat, year_label, and year_range can still be specified manually.

Value

A data frame or a list of data frames of S3 class SUMMERproj, which contains the smoothed estimates.

`hatchPlot` *Plot maps with uncertainty hatching.*

Description

This function visualizes the map with different variables. The input data frame can be either the long or wide format.

Usage

```
hatchPlot(data, variables, values = NULL, labels = NULL, geo, by.data,
  by.geo, is.long = FALSE, lower, upper, lim = NULL, lim.CI = NULL,
  breaks.CI = NULL, ncol = 4, hatch = NULL, border = NULL,
  size = 1, legend.label = NULL, per1000 = FALSE, direction = 1,
  ...)
```

Arguments

data	a data frame with variables to be plotted
variables	vector of variables to be plotted. If long format of data is used, only one variable can be selected
values	the column corresponding to the values to be plotted, only used when long format of data is used
labels	vector of labels to use for each variable, only used when wide format of data is used
geo	SpatialPolygonsDataFrame object for the map
by.data	column name specifying region names in the data
by.geo	variable name specifying region names in the data
is.long	logical indicator of whether the data is in the long format, default to FALSE
lower	column name of the lower bound of the CI
upper	column name of the upper bound of the CI
lim	fixed range of values for the variables to plot
lim.CI	fixed range of the CI widths to plot
breaks.CI	a vector of numerical values that decides the breaks in the CI widths to be shown
ncol	number of columns for the output tabs
hatch	color of the hatching lines.
border	color of the polygon borders.
size	line width of the polygon borders.
legend.label	Label for the color legend.
per1000	logical indicator to plot mortality rates as rates per 1,000 live births. Note that the added comparison data should always be in the probability scale.
direction	Direction of the color scheme. It can be either 1 (smaller values are darker) or -1 (higher values are darker). Default is set to 1.
...	unused.

## End(Not run)
```

`iid.new` *New random IID models for m-year to period random effects*

Description

New random IID models for m-year to period random effects

Usage

```
iid.new(cmd = c("graph", "Q", "mu", "initial", "log.norm.const",
  "log.prior", "quit"), theta = NULL)
```

Arguments

`cmd`	list of model components
`theta`	log precision

`iid.new.pc` *New random IID models for m-year to period random effects*

Description

New random IID models for m-year to period random effects

Usage

```
iid.new.pc(cmd = c("graph", "Q", "mu", "initial", "log.norm.const",
  "log.prior", "quit"), theta = NULL)
```

Arguments

cmd	list of model components
theta	log precision

KenData *Auxiliary data for Kenya 2014 DHS.*

Description

The list contains several data frames.

Usage

```
data(KenData)
```

Format

An object of class `list` of length 4.

Details

- HIV2014, a data frame with three columns: years (in five year periods), region (8 Admin-1 region groups), and the estimated bias of the reported U5MR due to HIV for each 5 year period from 1990-1994 to 2010-2014. The bias is represented as the ratio of the reported U5MR to the true U5MR.
- HIV2014.yearly, a data frame with three columns: years (in one year interval), region (8 Admin-1 region groups), and the estimated bias of the reported U5MR due to HIV for each year from 1980 to 2014. The bias is represented as the ratio of the reported U5MR to the true U5MR.
- IGME2019. Yearly Estimates of national under-5 child mortality in Kenya from the 2019 UN-IGME estimates.
- UrbanProp. Proportion of urban population by county and total population by county. Source: 2009 Kenya Population and Housing Census, and Table A2 of Kenya 2014 DHS report.

KingCounty *Map of King County*

Description

Shapefiles are King County in the Washington States.

Usage

```
KingCounty
```

Format

An object of class `SpatialPolygonsDataFrame` with 48 rows and 9 columns.

logit *Logit transformation*

Description

Logit transformation

Usage

```
logit(x)
```

Arguments

x	data

Value

logit of x

Examples

```
x <- .5
logit(x)
```

MalawiData *Auxiliary data for Malawi 2000, 2004, 2010, and 2015 DHS.*

Description

The list contains several data frames.

Usage

```
data(MalawiData)
```

Format

An object of class `list` of length 4.

Details

- HIV, a data frame with three columns: years (in five year periods), survey, and the estimated bias of the reported U5MR due to HIV for each 5 year period. The bias is represented as the ratio of the reported U5MR to the true U5MR.
- HIV.yearly, a data frame with three columns: years (in one year interval), survey, and the estimated bias of the reported U5MR due to HIV for each year. The bias is represented as the ratio of the reported U5MR to the true U5MR.
- IGME2019. Yearly Estimates of national under-5 child mortality in Malawi from the 2019 UN-IGME estimates.
- IGME2019.nmr. Yearly Estimates of national neonatal mortality in Malawi from the 2019 UN-IGME estimates.

References

PLoS Medicine, 9(8):e1001298.

MalawiMap *Malawi Admin-2 map*

Description

SpatialPolygonsDataFrame objects that reflect the Admin 2 regions in Malawi, including the Likoma island. The Admin 2 region names are in the ADM2_EN field.

Usage

```
data(MalawiMap)
```

Format

An object of class SpatialPolygonsDataFrame with 28 rows and 14 columns.

---

mapPlot *Plot region-level variables on a map*

Description

This function visualizes the map with different variables. The input data frame can be either the long or wide format.

Usage

```
mapPlot(data = NULL, variables, values = NULL, labels = NULL, geo,
  by.data, by.geo, is.long = FALSE, size = 0.5, removetab = FALSE,
  border = "gray20", ncol = NULL, ylim = NULL, legend.label = NULL,
  per1000 = FALSE, clean = TRUE, size.label = 2, add.adj = FALSE,
  color.adj = "red", alpha.adj = 0.85, direction = 1)
```

Arguments

data	a data frame with variables to be plotted. When it is null, a map is produced.
variables	vector of variables to be plotted. If long format of data is used, only one variable can be selected
values	the column corresponding to the values to be plotted, only used when long format of data is used
labels	vector of labels to use for each variable, only used when wide format of data is used
geo	SpatialPolygonsDataFrame object for the map
by.data	column name specifying region names in the data
by.geo	variable name specifying region names in the data
is.long	logical indicator of whether the data is in the long format, default to FALSE
size	size of the border
removetab	logical indicator to not show the tab label, only applicable when only one tab is present.
border	color of the border
ncol	number of columns for the output tabs
ylim	range of the values to be plotted.
legend.label	Label for the color legend.
per1000	logical indicator to plot mortality rates as rates per 1,000 live births. Note that the added comparison data should always be in the probability scale.
clean	remove all coordinates for a cleaner layout, default to TRUE.

size.label	size of the label of the regions.
add.adj	logical indicator to add edges between connected regions.
color.adj	color of the adjacency matrix edges.
alpha.adj	alpha level (transparency) of the adjacency matrix edges.
direction	Direction of the color scheme. It can be either 1 (smaller values are darker) or -1 (higher values are darker). Default is set to 1.

mapPoints *Map GPS points to polygon regions*

Description

Map GPS points to polygon regions

Usage

```
mapPoints(data, geo, long, lat, names)
```

Arguments

data	point data with two columns of GPS locations.
geo	SpatialPolygonsDataFrame of the map
long	column name for longitudinal coordinate in the data
lat	column name for latitude coordinate in the data
names	character vector of region ids to be added to the neighbours list

Value

Spatial djacency matrix.

Author(s)

Zehang Richard Li

Examples

```
data(DemoMap)
dat <- data.frame(ID = c(1,2,3), lon = c(32.2, 33.7, 33), lat = c(0.1, 0.9, 2.8))
dat2 <- mapPoints(dat, DemoMap$geo, long = "lon", lat = "lat", names = "REGNAME")
dat2
```

---

plot.SUMMERproj *Plot projection output.*

Description

Plot projection output.

Usage

```
## S3 method for class 'SUMMERproj'
plot(x, year_label = c("85-89", "90-94", "95-99",
  "00-04", "05-09", "10-14", "15-19"), year_med = c(1987, 1992, 1997,
  2002, 2007, 2012, 2017), is.subnational = TRUE, proj_year = 2015,
  data.add = NULL, option.add = list(point = NULL, lower = NULL, upper
  = NULL, by = NULL), color.add = "black", label.add = NULL,
  dodge.width = 1, plot.CI = NULL, per1000 = FALSE,
  color.CI = NULL, alpha.CI = 0.5, ...)
```

Arguments

x	output from getSmoothed
year_label	labels for the periods
year_med	labels for the middle years in each period, only used when both yearly and period estimates are plotted. In that case, year_med specifies where each period estimates are aligned.
is.subnational	logical indicator of whether the data contains subnational estimates
proj_year	the first year where projections are made, i.e., where no data are available.
data.add	data frame for the Comparisons data points to add to the graph. This can be, for example, the raw direct estimates. This data frame is merged to the projections by column 'region' and 'years'. Except for these two columns, this dataset should not have Comparisons columns with names overlapping the getSmoothed output.
option.add	list of options specifying the variable names for the points to plot, lower and upper bounds, and the grouping variable. This is intended to be used to add Comparisons estimates on the same plot as the smoothed estimates. See examples for details.
color.add	the color of the Comparisons data points to plot.
label.add	the label of the Comparisons data points in the legend.
dodge.width	the amount to add to data points at the same year to avoid overlap. Default to be 1.
plot.CI	logical indicator of whether to plot the error bars.
per1000	logical indicator to plot mortality rates as rates per 1,000 live births. Note that the added comparison data should always be in the probability scale.
color.CI	the color of the error bars of the credible interval.
alpha.CI	the alpha (transparency) of the error bars of the credible interval.
...	optional arguments, see details

Details

Examples of some arguments:

- year_labelstring of year labels, e.g., c("85-89","90-94","95-99","00-04","05-09","10-14","15-19") or c(1985:2019)
- proj_yearthe year projection starts, e.g., 2015
- year_med median of year intervals, e.g., c(1987,1992,1997,2002,2007,2012,2017)

```

`ridgePlot` *Calculate and plot posterior densities of the projected estimates*

Description

The function `ridgePlot` replaces the previous function name `getSmoothedDensity` (before version 1.0.0).

Usage

```
ridgePlot(x = NULL, nsim = 1000, draws = NULL, Amat = NULL,
  year_plot = NULL, strata_plot = NULL, by.year = TRUE, ncol = 4,
```

```
  scale = 2, per1000 = FALSE, order = 0, direction = 1,
  results = NULL, ...)

getSmoothedDensity(x = NULL, nsim = 1000, draws = NULL,
  Amat = NULL, year_plot = NULL, strata_plot = NULL,
  by.year = TRUE, ncol = 4, scale = 2, per1000 = FALSE,
  order = 0, direction = 1, results = NULL, ...)
```

Arguments

x	output from smoothDirect for the smoothed direct estimates, or smoothCluster for the cluster-level estimates.
nsim	number of posterior draws to take. Only used for cluster-level models when draws is NULL. Otherwise the posterior draws in draws will be used instead without resampling.
draws	Output of getSmoothed with save.draws set to TRUE. This argument allows the previously sampled draws (by setting save.draws to be TRUE) be used in new aggregation tasks. This argument is only used for cluster-level models.
Amat	adjacency matrix
year_plot	A vector indicate which years to plot
strata_plot	Name of the strata to plot. If not specified, the overall is plotted.
by.year	logical indicator for whether the output uses years as facets.
ncol	number of columns in the output figure.
scale	numerical value controlling the height of the density plots.
per1000	logical indicator to multiply results by 1000.
order	order of regions when by.year is set to TRUE. Negative values indicate regions are ordered from high to low posterior medians from top to bottom. Positive values indicate from low to high. 0 indicate alphabetic orders.
direction	Direction of the color scheme. It can be either 1 (smaller values are darker) or -1 (higher values are darker). Default is set to 1.
results	output from ridgePlot. This argument can be specified to avoid calculating densities again when only the visualization changes.
...	additional configurations passed to inla.posterior.sample.

Value

a data frame of the calculated densities and a ggplot figure.

rst *Simulate spatial and temporal random effects*

Description

This function simulates spatial and temporal random effects with mean zero. The method is described in Algorithm 3.1 of Rue & Held 2015.

Usage

```
rst(n = 1, type = c("s", "t", "st")[1], type.s = "ICAR",
  type.t = c("RW1", "RW2")[2], Amat = NULL, n.t = NULL,
  scale.model = TRUE)
```

Arguments

n	sample size
type	type of random effects: temporal (t), spatial (s), or spatial-temporal (st)
type.s	type of spatial random effect, currently only ICAR is available
type.t	type of temporal random effect, currently only RW1 and RW2 are available
Amat	adjacency matrix for the spatial regions
n.t	number of time points for the temporal random effect
scale.model	logical indicator of whether to scale the random effects to have unit generalized variance. See Sørbye 2013 for more details

Value

a matrix (for spatial or temporal) or a three-dimensional array (for spatial-temporal) of the random effects.

Author(s)

Zehang Richard Li

```

Arguments

cmd	list of model components
theta	log precision

---

simhyper *Simulate hyperpriors from an GMRF*

Description

Simulate hyperpriors from an GMRF

Usage

```
simhyper(R = 2, nsamp = 1e+05, nsamp.check = 5000, Amat,
  nperiod = 6, only.iid = TRUE)
```

Arguments

R	Desired prior odds ratio. Default to 2, i.e., a 95% prior interval for the residual odds ratios lies in the interval (R, 1/R).
nsamp	Sample to simulate for scaling factor
nsamp.check	Sample to simulate for checking range
Amat	Adjacency matrix of the areas in the data.
nperiod	numerical value of how many time periods in the data
only.iid	Indicator for whether or not only IID hyperpriors are simulated

pc.alpha.cor = 0.9, pc.st.u = NA, pc.st.alpha = NA,
pc.st.slope.u = NA, pc.st.slope.alpha = NA, overdisp.mean = 0,
overdisp.prec = 0.4, options = list(config = TRUE),
control.inla = list(strategy = "adaptive", int.strategy = "auto"),
verbose = FALSE, geo = NULL, rw = NULL, ar = NULL,
st.rw = NULL, ...)
```

Arguments

`data`	count data of person-months with the following columns • cluster: cluster ID • years: time period • region: region of the cluster • strata: stratum of the cluster • age: age group corresponding to the row • total: total number of person-month in this age group, stratum, cluster, and period • Y: total number of deaths in this age group, stratum, cluster, and period
`family`	family of the model. This can be either binomial (with logistic normal prior), betabiniomial.
`age.groups`	a character vector of age groups in increasing order.
`age.n`	number of months in each age groups in the same order.
`age.rw.group`	vector indicating grouping of the ages groups. For example, if each age group is assigned a different random walk component, then set age.rw.group to c(1:length(age.groups)); if all age groups share the same random walk component, then set age.rw.group to a rep(1, length(age.groups)). The default for 6 age groups is c(1,2,3,3,3,3), which assigns a separate random walk to the first two groups and a common random walk for the rest of the age groups. The vector should contain values starting from 1.
`time.model`	Model for the main temporal trend, can be rw1, rw2, or ar1. ar1 is not implemented for yearly model with period data input. Default to be rw2. For ar1 main effect, a linear slope is also added with time scaled to be between -0.5 to 0.5, i.e., the slope coefficient represents the total change between the first year and the last year in the projection period on the logit scale.
`st.time.model`	Temporal component model for the interaction term, can be rw1, rw2, or ar1. ar1 is not implemented for yearly model with period data input. Default to be the same as time.model unless specified otherwise. For ar1 interaction model, region-specific random slopes can be added by specifying `pc.st.slope.u` and `pc.st.slope.alpha`.
`Amat`	Adjacency matrix for the regions
`bias.adj`	the ratio of unadjusted mortality rates or age-group-specific hazards to the true rates or hazards. It needs to be a data frame that can be merged to thee outcome, i.e., with the same column names for time periods (for national adjustment), or

time periods and region (for subnational adjustment). The column specifying the adjustment ratio should be named "ratio".

`bias.adj.by` vector of the column names specifying how to merge the bias adjustment to the count data. For example, if bias adjustment factor is provided in bias.adj for each region and time, then bias.adj.by should be 'c("region", "time")'.

`formula` INLA formula. See vignette for example of using customized formula.

`year_label` string vector of year names

`type.st` type for space-time interaction

`survey.effect` logical indicator whether to include a survey iid random effect. If this is set to TRUE, there needs to be a column named 'survey' in the input data frame. In prediction, this random effect term will be set to 0.

`strata.time.effect`
logical indicator whether to include strata specific temporal trends.

`hyper` which hyperpriors to use. Default to be using the PC prior ("pc").

`pc.u` hyperparameter U for the PC prior on precisions.

`pc.alpha` hyperparameter alpha for the PC prior on precisions.

`pc.u.phi` hyperparameter U for the PC prior on the mixture probability phi in BYM2 model.

`pc.alpha.phi` hyperparameter alpha for the PC prior on the mixture probability phi in BYM2 model.

`pc.u.cor` hyperparameter U for the PC prior on the autocorrelation parameter in the AR prior, i.e. Prob(cor > pc.u.cor) = pc.alpha.cor.

`pc.alpha.cor` hyperparameter alpha for the PC prior on the autocorrelation parameter in the AR prior.

`pc.st.u` hyperparameter U for the PC prior on precisions for the interaction term.

`pc.st.alpha` hyperparameter alpha for the PC prior on precisions for the interaction term.

`pc.st.slope.u` hyperparameter U for the PC prior on precisions for the area-level random slope. If both pc.st.slope.u and pc.st.slope.alpha are not NA, an area-level random slope with iid prior will be added to the model. The parameterization of the random slope is so that Prob(|beta| > pc.st.slope.u) = pc.st.slope.alpha, where time covariate is rescaled to be -0.5 to 0.5, so that the random slope can be interpreted as the total deviation from the main trend from the first year to the last year to be projected, on the logit scale.

`pc.st.slope.alpha`
hyperparameter alpha for the PC prior on precisions for the area-level random slope. See above for the parameterization.

`overdisp.mean` hyperparameter for the betabinomial likelihood. Mean of the over-dispersion parameter on the logit scale.

`overdisp.prec` hyperparameter for the betabinomial likelihood. Precision of the over-dispersion parameter on the logit scale.

`options` list of options to be passed to control.compute() in the inla() function.

`control.inla` list of options to be passed to control.inla() in the inla() function. Default to the "adaptive" integration strategy.

verbose	logical indicator to print out detailed inla() intermediate steps.
geo	Deprecated. Spatial polygon file, legacy parameter from previous versions of the package.
rw	Deprecated. Take values 0, 1 or 2, indicating the order of random walk. If rw = 0, the autoregressive process is used instead of the random walk in the main trend. See the description of the argument ar for details.
ar	Deprecated. Order of the autoregressive component. If ar is specified to be positive integer, the random walk components will be replaced by AR(p) terms in the interaction part. The main temporal trend remains to be random walk of order rw unless rw = 0.
st.rw	Deprecated. Take values 1 or 2, indicating the order of random walk for the interaction term. If not specified, it will take the same order as the argument rw in the main effect. Notice that this argument is only used if ar is set to 0.
...	arguments to be passed to the inla() function call.

Value

INLA model fit using the provided formula, country summary data, and geographic data

  openmp.strategy = "default"), control.inla = list(strategy =
  "adaptive", int.strategy = "auto"), verbose = FALSE, geo = NULL,
  rw = NULL, ar = NULL)
```

Arguments

`data`	Combined dataset
`Amat`	Adjacency matrix for the regions

X	Covariate matrix. It must contain either a column with name "region", or a column with name "years", or both. The covariates must not have missing values for all regions (if varying in space) and all time periods (if varying in time). The rest of the columns are treated as covariates in the mean model.
formula	INLA formula. See vignette for example of using customized formula.
time.model	Model for the main temporal trend, can be rw1, rw2, or ar1. ar1 is not implemented for yearly model with period data input. Default to be rw2. For ar1 main effect, a linear slope is also added with time scaled to be between -0.5 to 0.5, i.e., the slope coefficient represents the total change between the first year and the last year in the projection period on the logit scale.
st.time.model	Temporal component model for the interaction term, can be rw1, rw2, or ar1. ar1 is not implemented for yearly model with period data input. Default to be the same as time.model unless specified otherwise. For ar1 interaction model, region-specific random slopes can be added by specifying pc.st.slope.u and pc.st.slope.alpha.
year_label	string vector of year names
year_range	Entire range of the years (inclusive) defined in year_label.
is.yearly	Logical indicator for fitting yearly or period model.
m	Number of years in each period.
type.st	type for space-time interaction
survey.effect	logical indicator whether to include a survey iid random effect. If this is set to TRUE, there needs to be a column named 'survey' in the input data frame. In prediction, this random effect term will be set to 0.
hyper	which hyperpriors to use. Default to be using the PC prior ("pc").
pc.u	hyperparameter U for the PC prior on precisions.
pc.alpha	hyperparameter alpha for the PC prior on precisions.
pc.u.phi	hyperparameter U for the PC prior on the mixture probability phi in BYM2 model.
pc.alpha.phi	hyperparameter alpha for the PC prior on the mixture probability phi in BYM2 model.
pc.u.cor	hyperparameter U for the PC prior on the autocorrelation parameter in the AR prior, i.e. Prob(cor > pc.u.cor) = pc.alpha.cor.
pc.alpha.cor	hyperparameter alpha for the PC prior on the autocorrelation parameter in the AR prior.
pc.st.u	hyperparameter U for the PC prior on precisions for the interaction term.
pc.st.alpha	hyperparameter alpha for the PC prior on precisions for the interaction term.
options	list of options to be passed to control.compute() in the inla() function.
control.inla	list of options to be passed to control.inla() in the inla() function. Default to the "adaptive" integration strategy.
verbose	logical indicator to print out detailed inla() intermediate steps.
geo	Deprecated.
rw	Deprecated.
ar	Deprecated.

Value

List of fitted object

smoothSurvey *Fit space-time smoothing models for a generic outcome from complex surveys.*

Description

This function calculates the direct estimates by region and fit a simple spatial smoothing model to the direct estimates adjusting for survey design. Normal or binary variables are currently supported. For binary variables, the logit transformation is performed on the direct estimates of probabilities, and a Gaussian additive model is fitted on the logit scale using INLA.

Usage

```
smoothSurvey(data, geo = NULL, Amat, X = NULL,
  responseType = c("binary", "gaussian")[1], responseVar,
  strataVar = "strata", weightVar = "weights", regionVar = "region",
  clusterVar = "~v001+v002", pc.u = 1, pc.alpha = 0.01,
  pc.u.phi = 0.5, pc.alpha.phi = 2/3, CI = 0.95, formula = NULL,
  timeVar = NULL, time.model = c("rw1", "rw2")[1], type.st = 1,
  direct.est = NULL, direct.est.var = NULL, ...)

fitGeneric(data, geo = NULL, Amat, X = NULL,
  responseType = c("binary", "gaussian")[1], responseVar,
  strataVar = "strata", weightVar = "weights", regionVar = "region",
  clusterVar = "~v001+v002", pc.u = 1, pc.alpha = 0.01,
  pc.u.phi = 0.5, pc.alpha.phi = 2/3, CI = 0.95, formula = NULL,
  timeVar = NULL, time.model = c("rw1", "rw2")[1], type.st = 1,
  direct.est = NULL, direct.est.var = NULL, ...)
```

Arguments

data	data frame with region and strata information.
geo	Deprecated argument from early versions.
Amat	Adjacency matrix for the regions.
X	Covariate matrix with the first column being the region names. Currently only supporting static region-level covariates.
responseType	Type of the response variable, currently supports 'binary' (default with logit link function) or 'gaussian'.
responseVar	the response variable
strataVar	the strata variable
weightVar	the weights variable
regionVar	Variable name for region, typically 'v024', for older surveys might be 'v101'
clusterVar	Variable name for cluster, typically '~v001 + v002'
pc.u	hyperparameter U for the PC prior on precisions.

pc.alpha	hyperparameter alpha for the PC prior on precisions.
pc.u.phi	hyperparameter U for the PC prior on the mixture probability phi in BYM2 model.
pc.alpha.phi	hyperparameter alpha for the PC prior on the mixture probability phi in BYM2 model.
CI	the desired posterior credible interval to calculate
formula	a string of user-specified random effects model to be used in the INLA call
timeVar	The variable indicating time period. If set to NULL then the temporal model and space-time interaction model are ignored.
time.model	the model for temporal trends and interactions. It can be either "rw1" or "rw2".
type.st	can take values 0 (no interaction), or 1 to 4, corresponding to the type I to IV space-time interaction.
direct.est	data frame of direct estimates, with column names of response and region specified by responseVar, regionVar, and timeVar. When direct.est is specified, it overwrites the data input.
direct.est.var	the column name corresponding to the variance of direct estimates
...	additional arguments passed to svydesign function.

Details

The function smoothSurvey replaces the previous function name fitGeneric (before version 1.0.0).

Value

HT	Direct estimates
smooth	Smoothed direct estimates
fit	a fitted INLA object
CI	input argument
Amat	input argument
responseType	input argument
formula	INLA formula

`st.new` *New Type I to IV space time interaction models for m-year to period random effects*

Description

New Type I to IV space time interaction models for m-year to period random effects

Usage

```
st.new(cmd = c("graph", "Q", "mu", "initial", "log.norm.const",
  "log.prior", "quit"), theta = NULL)
```

Arguments

cmd	list of model components
theta	log precision

---

st.new.pc *New Type I to IV space time interaction models for m-year to period random effects*

Description

New Type I to IV space time interaction models for m-year to period random effects

Usage

```
st.new.pc(cmd = c("graph", "Q", "mu", "initial", "log.norm.const",
  "log.prior", "quit"), theta = NULL)
```

Arguments

cmd	list of model components
theta	log precision

---

tcpPlot *Discrete-color maps based on the True Classification Probabilities*

Description

Discrete-color maps based on the True Classification Probabilities

Usage

```
tcpPlot(draws, geo, by.geo = NULL, year_plot = NULL, ncol = 4,
  per1000 = FALSE, thresholds = NULL, intervals = 3,
  size.title = 0.7, legend.label = NULL, border = "gray20",
  size = 0.5)
```

Arguments

draws	a posterior draw object from getSmoothed
geo	SpatialPolygonsDataFrame object for the map
by.geo	variable name specifying region names in geo
year_plot	vector of year string vector to be plotted.
ncol	number of columns in the output figure.
per1000	logical indicator to multiply results by 1000.
thresholds	a vector of thresholds (on the mortality scale) defining the discrete color scale of the maps.
intervals	number of quantile intervals defining the discrete color scale of the maps. Required when thresholds are not specified.
size.title	a numerical value giving the amount by which the plot title should be magnified relative to the default.
legend.label	Label for the color legend.
border	color of the border
size	size of the border

Value

a list of True Classification Probability (TCP) tables, a list of individual spplot maps, and a gridded array of all maps.
