

Illustration of the Wrapped package

by

Saralees Nadarajah and Yuanyuan Zhang

School of Mathematics, University of Manchester, Manchester M13 9PL, UK

Abstract: The six main functions in `Wrapped` are illustrated through various examples.

1 Introduction

Nadarajah and Zhang (2017) developed the R package `Wrapped`. A description of the program structure of the package is given in Section 2 of Nadarajah and Zhang (2017). There are six main functions: `dwrappedg`, `pwrappedg`, `qwrappedg`, `rwrappedg`, `mwrappedg` and `plotfour`. Various numerical illustrations of these functions are given in Sections 2 to 7.

2 Illustrations of the use of `dwrappedg`

The first illustration plots the PDF of the wrapped beta normal distribution for selected parameter values.

```
x <- -pi+2*pi*seq(0.01,0.99,0.01)
y <- dwrappedg(x, "betanorm", K = 100, shape1 = 0.1, shape2 = 0.9)
plot(x, y, xlab = "x", ylab = "PDF", type = "l")
```

The plot is

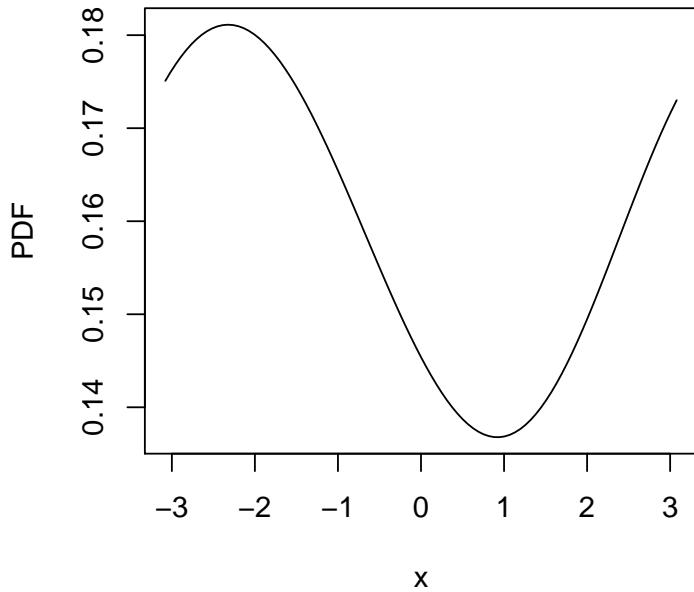

Figure 1: PDF of the wrapped beta normal distribution.

The second illustration plots the PDF of the wrapped skew normal distribution for selected parameter values.

```
x <- -pi+2*pi*seq(0.01,0.99,0.01)
y <- dwrappedg(x, "sn", K = 100, alpha = -2)
plot(x, y, xlab = "x", ylab = "PDF", type = "l")
```

The plot is

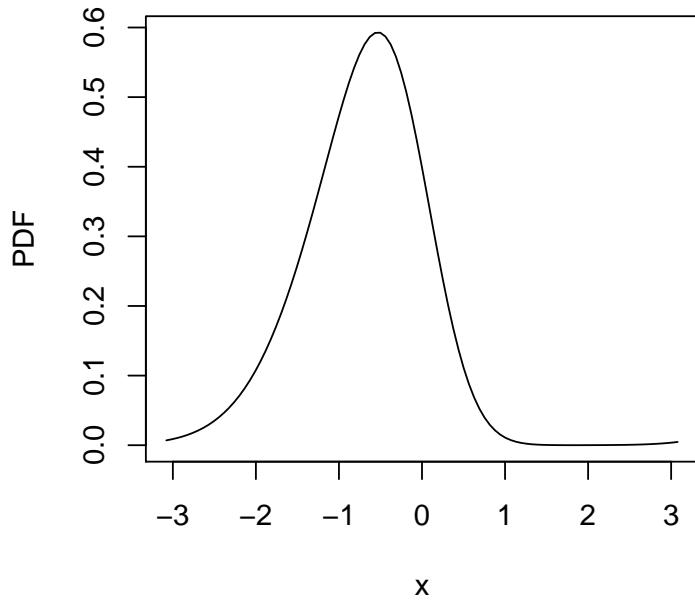

Figure 2: PDF of the wrapped skew normal distribution.

The third illustration plots the PDF of the wrapped asymmetric Laplace distribution for selected parameter values.

```
x <- -pi+2*pi*seq(0.01,0.99,0.01)
y <- dwrappedg(x, "asla", K = 100, kappa = 50)
plot(x, y, xlab = "x", ylab = "PDF", type = "l")
```

The plot is

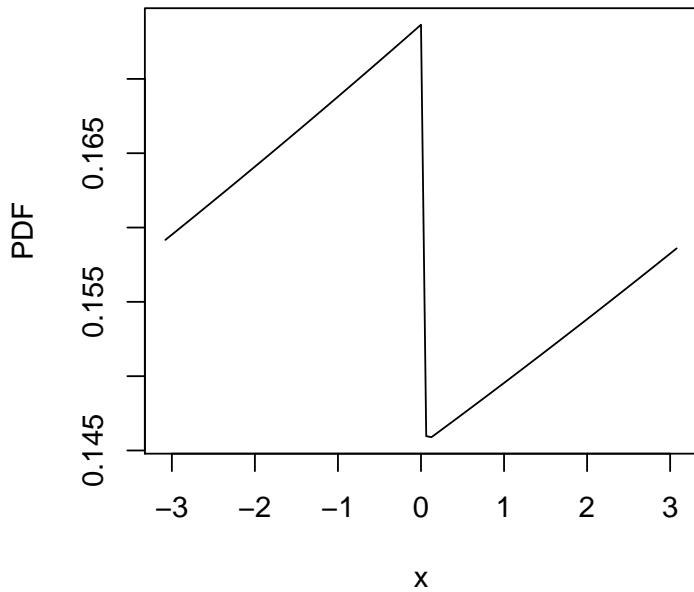

Figure 3: PDF of the wrapped asymmetric Laplace distribution.

The fourth illustration plots the PDF of the wrapped skew t type 3 distribution for selected parameter values.

```
x <- -pi+2*pi*seq(0.01,0.99,0.01)
y <- dwrappedg(x, "ST3", K = 100, nu = 50, tau = 50)
plot(x, y, xlab = "x", ylab = "PDF", type = "l")
```

The plot is

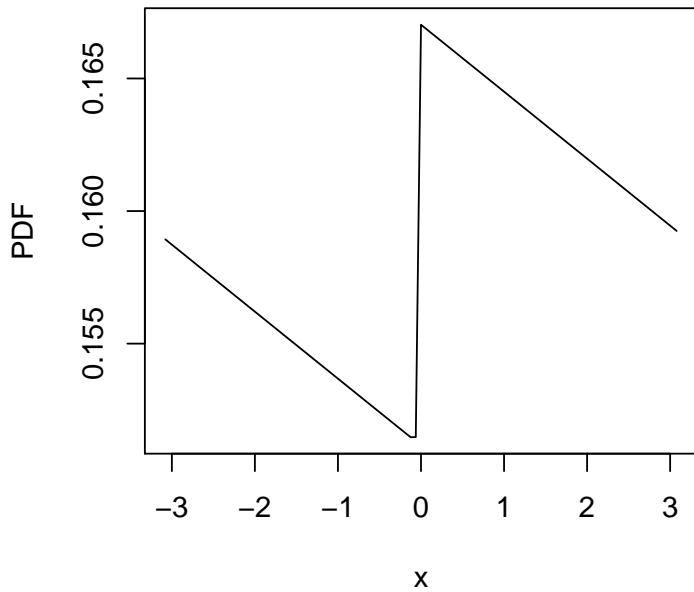

Figure 4: PDF of the wrapped skew t type 3 distribution.

3 Illustrations of the use of pwrappedg

The first illustration plots the CDF of the wrapped beta normal distribution for selected parameter values.

```
x <- -pi+2*pi*seq(0.01,0.99,0.01)
y <- pwrappedg(x, "betanorm", K = 100, shape1 = 0.1, shape2 = 0.9)
plot(x, y, xlab = "x", ylab = "CDF", type = "l")
```

The plot is

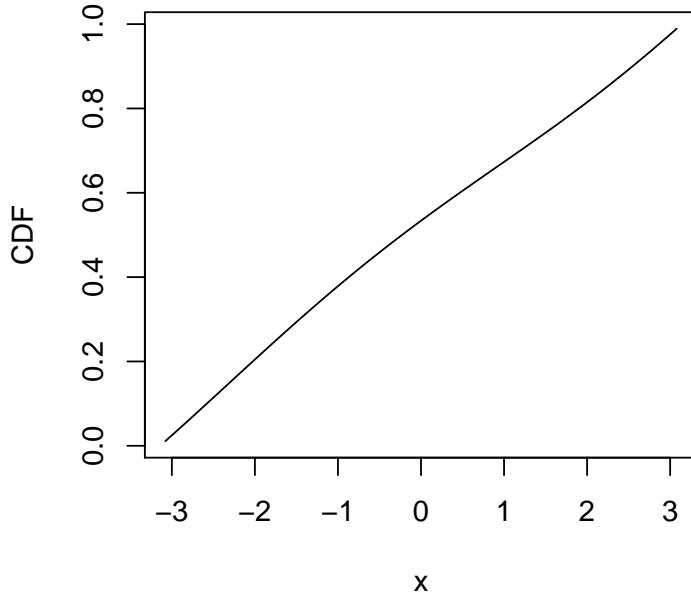

Figure 5: CDF of the wrapped beta normal distribution.

The second illustration plots the CDF of the wrapped skew normal distribution for selected parameter values.

```
x <- -pi+2*pi*seq(0.01,0.99,0.01)
y <- pwrappedg(x, "sn", K = 100, alpha = -2)
plot(x, y, xlab = "x", ylab = "CDF", type = "l")
```

The plot is

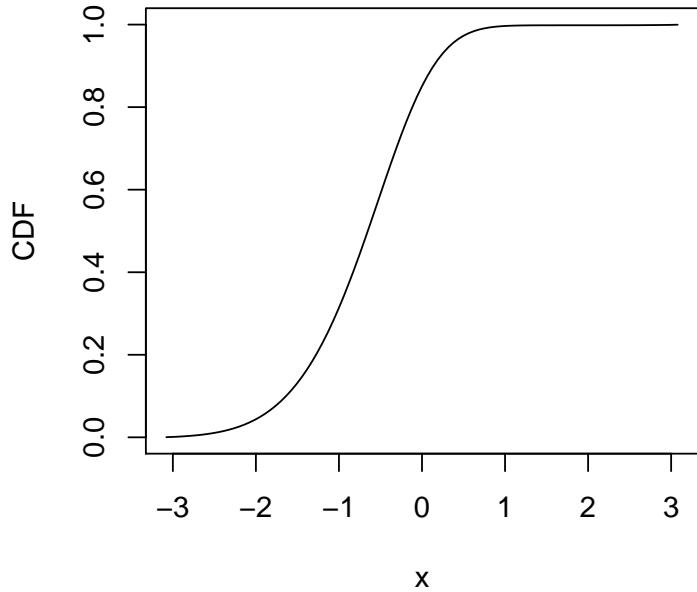

Figure 6: CDF of the wrapped skew normal distribution.

The third illustration plots the CDF of the wrapped asymmetric Laplace distribution for selected parameter values.

```
x <- -pi+2*pi*seq(0.01,0.99,0.01)
y <- pwrappedg(x, "asla", K = 100, kappa = 50)
plot(x, y, xlab = "x", ylab = "CDF", type = "l")
```

The plot is

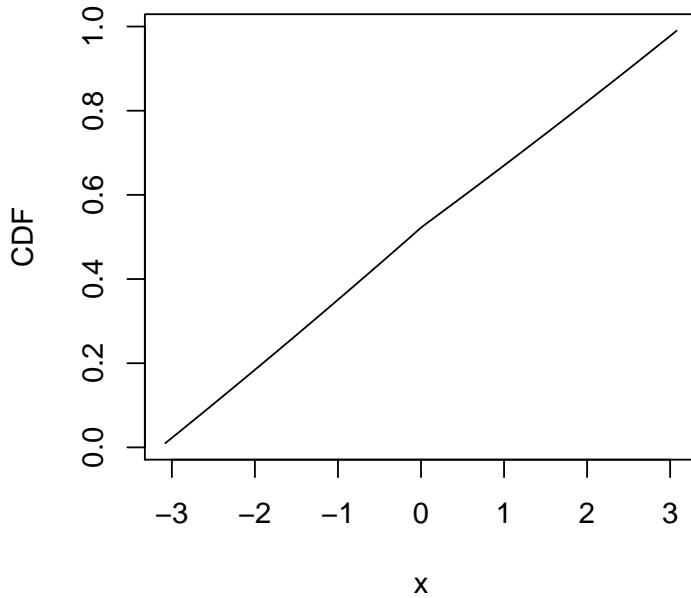

Figure 7: CDF of the wrapped asymmetric Laplace distribution.

The fourth illustration plots the CDF of the wrapped skew t type 3 distribution for selected parameter values.

```
x <- -pi+2*pi*seq(0.01,0.99,0.01)
y <- pwrappedg(x, "ST3", K = 100, nu = 50, tau = 50)
plot(x, y, xlab = "x", ylab = "CDF", type = "l")
```

The plot is

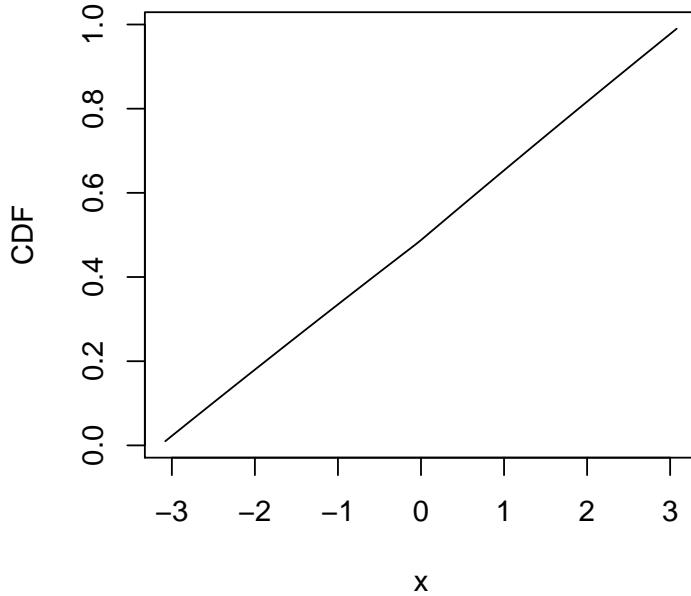

Figure 8: CDF of the wrapped skew t type 3 distribution.

4 Illustrations of the use of qwrappedg

The first illustration plots the quantile function of the wrapped beta normal distribution for selected parameter values.

```
x <- seq(0.01,0.99,0.01)
y <- qwrappedg(x, "betanorm", K = 100, shape1 = 0.1, shape2 = 0.9)
plot(x, y, xlab = "p", ylab = "Quantile function", type = "l")
```

The plot is

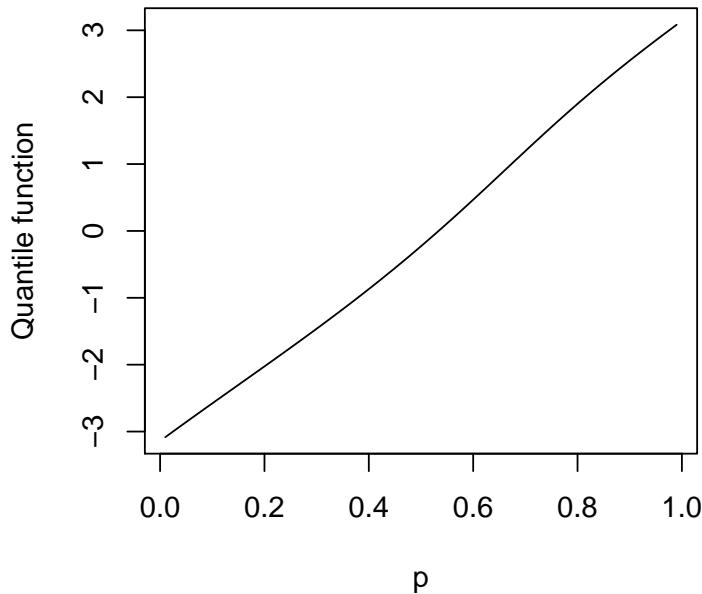

Figure 9: Quantile function of the wrapped beta normal distribution.

The second illustration plots the quantile function of the wrapped skew normal distribution for selected parameter values.

```
x <- seq(0.01,0.99,0.01)
y <- qwrappedg(x, "sn", K = 100, alpha = -2)
plot(x, y, xlab = "p", ylab = "Quantile function", type = "l")
```

The plot is

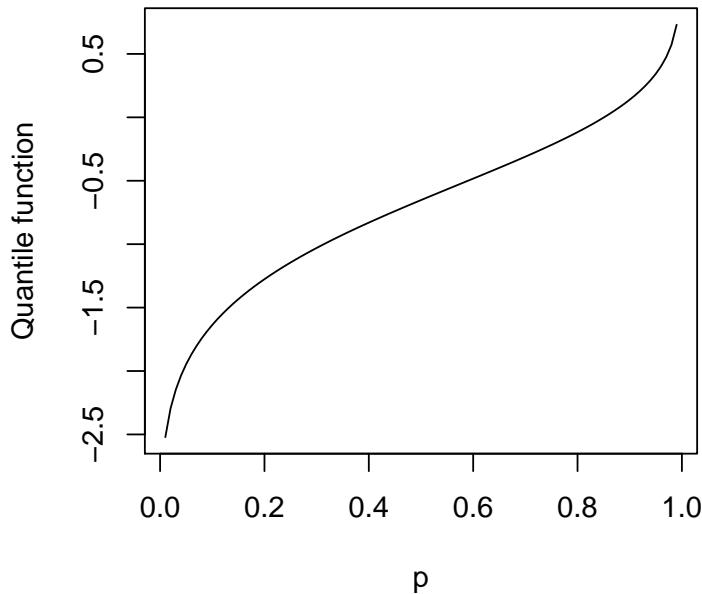

Figure 10: Quantile function of the wrapped skew normal distribution.

The third illustration plots the quantile function of the wrapped asymmetric Laplace distribution for selected parameter values.

```
x <- seq(0.01,0.99,0.01)
y <- qwrappedg(x, "asla", K = 100, kappa = 50)
plot(x, y, xlab = "p", ylab = "Quantile function", type = "l")
```

The plot is

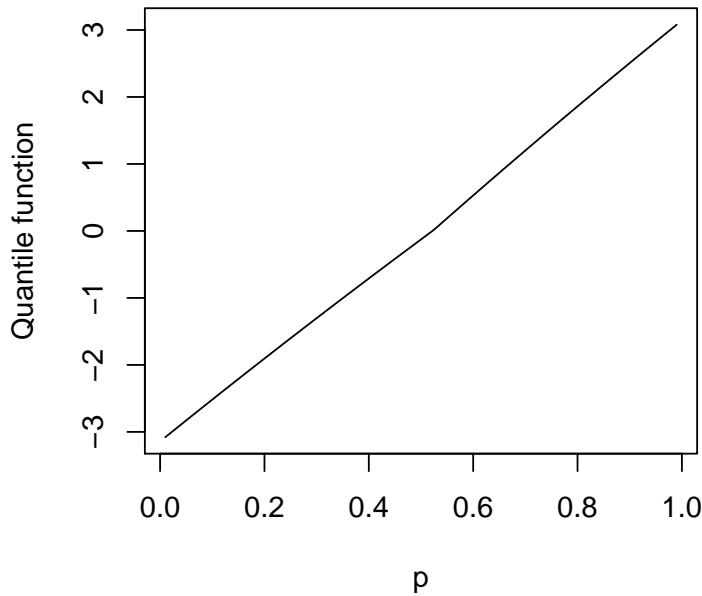

Figure 11: Quantile function of the wrapped asymmetric Laplace distribution.

The fourth illustration plots the quantile function of the wrapped skew t type 3 distribution for selected parameter values.

```
x <- seq(0.01,0.99,0.01)
y <- qwrappedg(x, "ST3", K = 100, nu = 50, tau = 50)
plot(x, y, xlab = "p", ylab = "Quantile function", type = "l")
```

The plot is

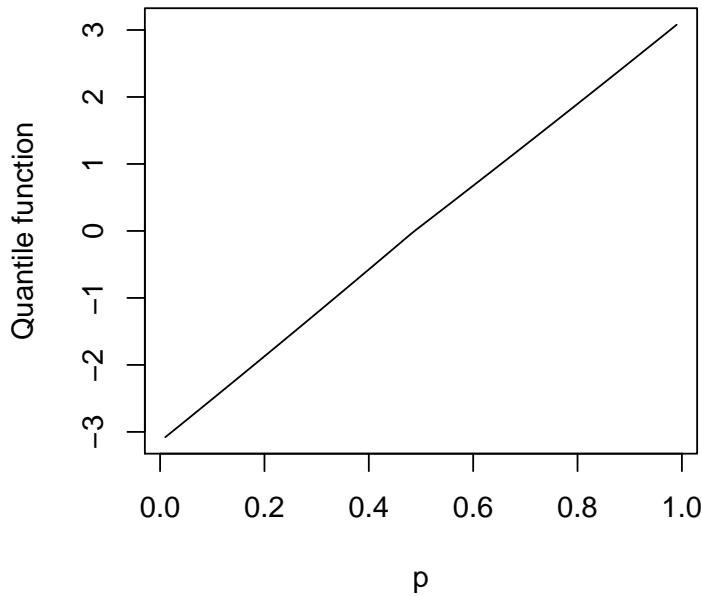

Figure 12: Quantile function of the wrapped skew t type 3 distribution.

5 Illustrations of the use of rwrappedg

The first illustration generates random numbers from the wrapped beta normal distribution for selected parameter values.

```
y <- rwrappedg(10, "betanorm", shape1 = 0.1, shape2 = 0.9)
y
```

The output is

	cc	ss
[1,]	0.83946691	0.54341081
[2,]	0.39540021	0.91850894
[3,]	0.04224134	-0.99910744
[4,]	-0.72772234	-0.68587185
[5,]	-0.99644429	0.08425424

```

6 Illustrations of the use of mwrappedg

Consider the following data on 30 cross-beds azimuths of palaeocurrents. The data on degrees is converted to radii.

```

x = c(294, 177, 257, 301, 257, 267, 329, 177, 241, 315,
+ 229, 239, 277, 250, 287, 281, 166, 229, 254, 232,
+ 290, 245, 245, 214, 272, 224, 215, 242, 186, 224)
x = 2 * pi * x / 360 - pi

```

The first illustration is the fit of the wrapped normal distribution to the data.

```
mwrappedg("norm", data = x, starts = c(mean(x), 1), K = 100, method = "BFGS")
```

The output is

```

For each of the five fitted wrapped distributions, the output gives the parameter estimates, standard errors, 95 percent confidence intervals, value of Akaike Information Criterion, value of Consistent Akaike Information Criterion, value of Bayesian Information Criterion, value of Hannan Quinn Information Criterion, Cramer von Misses statistic value, Anderson Darling statistic value,

minimum value of the negative log likelihood, Kolmogorov Smirnov statistic value, its p value and convergence status of the minimization of the negative log likelihood.

The standard errors appear smaller compared to the parameter estimates for each fitted distribution. An exception is the Student's t wrapped distribution. Also the p -value for each fitted distribution appears acceptable at the five percent significance level.

The wrapped normal distribution gives the smallest values for Cramer von Misses statistic, Anderson Darling statistic, Akaike Information Criterion, Consistent Akaike Information Criterion, Bayesian Information Criterion, Hannan Quinn information criterion, minimum of the negative log-likelihood function. But the wrapped logistic distribution gives the smallest Kolmogorov Smirnov test statistic and the largest p -value.

7 Illustrations of the use of plotfour

The first illustration plots the PDFs of the wrapped beta normal distribution for selected parameter values.

```
plotfour("betanorm",K=100,para=list(c(0,1,0.1,9),c(0,1,0.1,20),c(0,1,20,0.1),c(0,1,3,3)),  
plotit="pdf")
```

The plots are

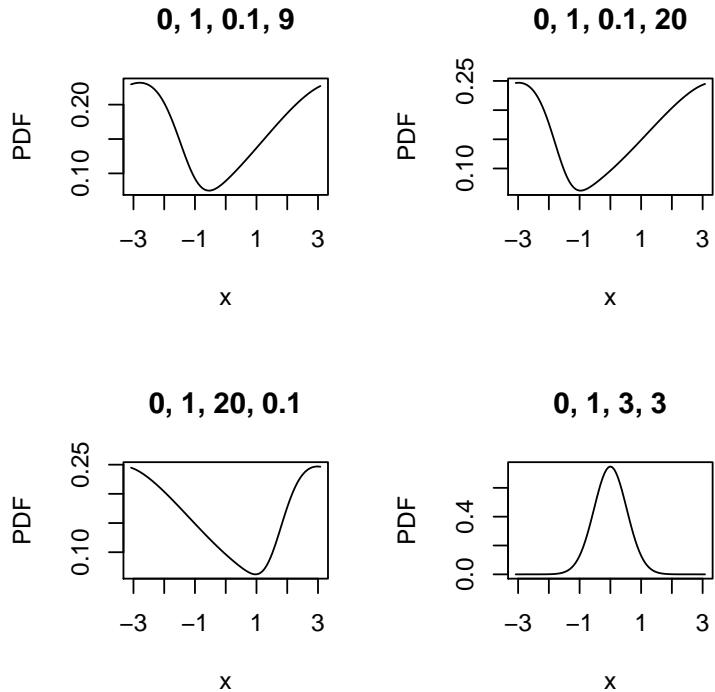

Figure 13: PDFs of the wrapped beta normal distributions for selected parameter values.

The second illustration plots the CDFs of the wrapped skew normal distributions for selected parameter values.

```
plotfour("sn",K=100,para=list(c(0,1,-2),c(0,1,0),c(0,1,2),c(0,1,10)),
plotit="cdf")
```

The plots are

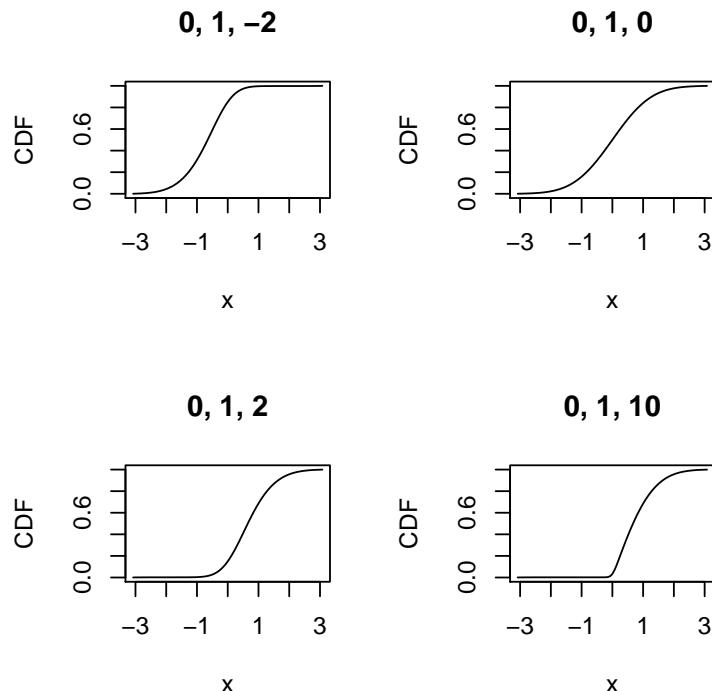

Figure 14: CDFs of the wrapped skew normal distributions for selected parameter values.

The third illustration plots the quantile functions of the wrapped asymmetric Laplace distributions for selected parameter values.

```
plotfour("asla",K=100,para=list(c(0,1,1),c(0,2,1),c(0,5,1),c(0,50,1)),
plotit="quantile")
```

The plots are

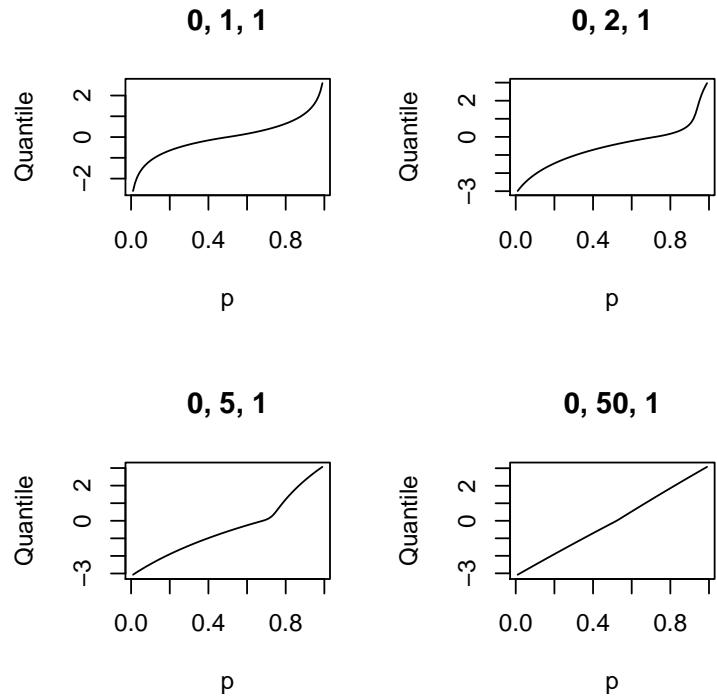

Figure 15: Qunatile functions of the wrapped asymmetric Laplace distributions for selected parameter values.

The fourth illustration plots the histograms of the radii of the 100 random numbers generated from the wrapped skew t type 3 distributions for selected parameter values.

```
plotfour("ST3",K=100,para=list(c(0,1,1,1),c(0,1,2,5),c(0,1,0.1,5),c(0,1,50,50)),
        plotit="random")
```

The plots are

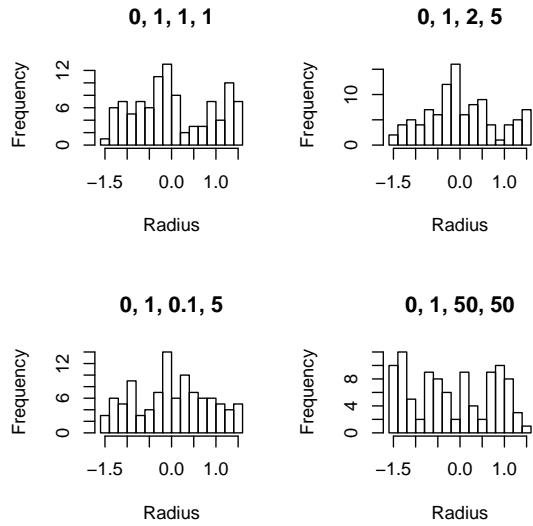

Figure 16: Histograms of 100 random numbers generated from the wrapped skew t type 3 distributions for selected parameter values.
