

Package ‘baseline’

May 11, 2020

Encoding UTF-8

Type Package

Title Baseline Correction of Spectra

Version 1.3-0

Date 2020-05-10

Maintainer Kristian Hovde Liland <kristian.liland@nmbu.no>

Description Collection of baseline correction algorithms, along with a framework and a Tcl/Tk enabled GUI for optimising baseline algorithm parameters. Typical use of the package is for removing background effects from spectra originating from various types of spectroscopy and spectrometry, possibly optimizing this with regard to regression or classification results. Correction methods include polynomial fitting, weighted local smoothers and many more.

License GPL-2

Depends R (>= 2.15)

Imports graphics, SparseM, grDevices, stats, methods, limSolve

Suggests gWidgets2, gWidgets2tcltk, IDPmisc, lattice, pls, MASS

baseline-package *Baseline correction*

Description

A common framework with implementations of several baseline correction methods

Details

Package: baseline
Type: Package
Version: 1.2-2
Date: 2019-11-05
License: GPL-2

Use function `baseline` for baseline correction. This function takes matrices of spectra, a method name and parameters needed for the specific method. See helpfiles for details.

Examples

```
# Load data
data(milk)
# The baseline() function is an S4 wrapper for all the different
# baseline correction methods. The default correction method
# is IRLS. Data must be organized as row vectors in a matrix
# or data.frame.
bc.irls <- baseline(milk$spectra[1,, drop=FALSE])
## Not run:
# Computationally heavy
```

```
plot(bc.irls)

## End(Not run)

# Available extractors are:
# getBaseline(bc.irls)
# getSpectra(bc.irls)
# getCorrected(bc.irls)
# getCall(bc.irls)

# Correction methods and parameters can be specified through the wrapper.
bc.fillPeaks <- baseline(milk$spectra[1,, drop=FALSE], lambda=6,
hwi=50, it=10, int=2000, method='fillPeaks')
## Not run:
# Computationally heavy
plot(bc.fillPeaks)

## End(Not run)

# If a suitable gWidgets2 implementation is installed, a
# graphical user interface is available for interactive
# parameter adaption.
## Not run:
# Dependent on external software
baselineGUI(milk$spectra)

## End(Not run)
```

algorithm

Extraction methods for "baselineAlgTest" objects

Description

Extraction methods specifically for objects of class `baselineAlgTest`

Usage

```
algorithm(object)
extraArgs(object)
```

Arguments

object Object of class `baselineAlgTest`

Value

The corresponding slot

Author(s)

See Also[baselineAlgTest](#)

baseline*Baseline correction*

Description

Common framework for baseline correction

Usage

```
baseline(spectra, method = "irls", ...)
```

Arguments

spectra	Matrix with spectra in rows
method	Baseline correction method
...	Additional parameters, sent to the method

Details

Estimates baselines for the spectra, using the algorithm named in method.

Value

An object of class [baseline](#).

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

## End(Not run)

```

baseline-class

Class "baseline"

Description

Stores the result of estimating baselines for one or more spectra.

Objects from the Class

The normal way to create objects is with the function [baseline](#). Several baseline algorithms are available. See [baseline](#) for details. There is a plot method for the class; see [plot, baseline-method](#).

Slots

baseline: A matrix with the estimated baselines

corrected: A matrix with the corrected spectra

spectra: A matrix with the original spectra

call: The call to [baseline](#)

Methods

getBaseline signature(object = "baseline"): Extract the estimated baselines

getCall signature(object = "baseline"): Extract the call to [baseline](#) used to create the object

getCorrected signature(object = "baseline"): Extract the corrected spectra

getSpectra signature(object = "baseline"): Extract the original spectra

Warning

In a future version, one of the slots might be removed from the class definition and calculated on the fly instead, in order to save space. Therefore, *do* use the extractor functions (`getSpectra`, `getBaseline` and `getCorrected`) instead of accessing the slots directly.

baseline.als

Asymmetric Least Squares

Description

Baseline correction by 2nd derivative constrained weighted regression. Original algorithm proposed by Paul H. C. Eilers and Hans F.M. Boelens

Usage

```
baseline.als(spectra, lambda = 6, p = 0.05, maxit = 20)
```

Arguments

spectra	Matrix with spectra in rows
lambda	2nd derivative constraint
p	Weighting of positive residuals
maxit	Maximum number of iterations

Details

Iterative algorithm applying 2nd derivative constraints. Weights from previous iteration is p for positive residuals and $1-p$ for negative residuals.

Value

baseline	Matrix of baselines corresponding to spectra spectra
corrected	Matrix of baseline corrected spectra
wgts	Matrix of final regression weights

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

Paul H. C. Eilers and Hans F.M. Boelens: Baseline Correction with Asymmetric Least Squares Smoothing

Examples

```
data(milk)
bc.als <- baseline(milk$spectra[1,, drop=FALSE], lambda=10, method='als')
## Not run:
plot(bc.als)

## End(Not run)
```

baseline.fillPeaks *Fill peaks*

Description

An iterative algorithm using suppression of baseline by means in local windows

Usage

```
baseline.fillPeaks(spectra, lambda, hwi, it, int)
```

Arguments

spectra	Matrix with spectra in rows
lambda	2nd derivative penalty for primary smoothing
hwi	Half width of local windows
it	Number of iterations in suppression loop
int	Number of buckets to divide spectra into

Details

In local windows of buckets the minimum of the mean and the previous iteration is chosen as the new baseline

Value

baseline	Matrix of baselines corresponding to spectra spectra
corrected	Matrix of baseline corrected spectra

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

Kristian Hovde Liland, 4S Peak Filling - baseline estimation by iterative mean suppression, MethodsX 2015

Examples

```
data(milk)
bc.fillPeaks <- baseline(milk$spectra[1,, drop=FALSE], lambda=6,
hwi=50, it=10, int=2000, method='fillPeaks')
## Not run:
plot(bc.fillPeaks)

## End(Not run)
```

baseline.irls

Iterative Restricted Least Squares

Description

An algorithm with primary smoothing and repeated baseline suppressions and regressions with 2nd derivative constraint

Usage

```
baseline.irls(spectra, lambda1 = 5, lambda2 = 9, maxit = 200, wi = 0.05)
```

Arguments

spectra	Matrix with spectra in rows
lambda1	2nd derivative constraint for primary smoothing
lambda2	2nd derivative constraint for secondary smoothing
maxit	Maximum number of iterations
wi	Weighting of positive residuals

Value

baseline	Matrix of baselines corresponding to spectra spectra
corrected	Matrix of baseline corrected spectra
smoothed	Matrix of primary smoothed spectra

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

Examples

```
data(milk)
bc.irls <- baseline(milk$spectra[1,, drop=FALSE], method='irls')
## Not run:
plot(bc.irls)

## End(Not run)
```

baseline.lowpass *Low-pass FFT filter*

Description

An algorithm for removing baselines based on Fast Fourier Transform filtering

Usage

```
baseline.lowpass(spectra, steep = 2, half = 5)
```

Arguments

spectra	Matrix with spectra in rows
steep	Steepness of filter curve
half	Half-way point of filter curve

Details

Since the scale of the spectra will be different after filtering, baselines will not be returned by the algorithm

Value

baseline	Matrix of baselines corresponding to spectra spectra
corrected	Matrix of baseline corrected spectra

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

AHMET K. ATAKAN, W. E. BLASS, and D. E. JENNINGS: Elimination of Baseline Variations from a Recorded Spectrum by Ultra-low Frequency Filtering

Examples

```
data(milk)
bc.lowpass <- baseline(milk$spectra[1,, drop=FALSE], method='lowpass')
## Not run:
plot(bc.lowpass)

## End(Not run)
```

baseline.medianWindow *Median window*

Description

An implementation and extention of Mark S. Friedrichs' model-free algorithm

Usage

```
baseline.medianWindow(spectra, hwm, hws, end)
```

Arguments

spectra	Matrix with spectra in rows
hwm	Window half width for local medians
hws	Window half width for local smoothing (optional)
end	Original endpoint handling (optional boolean)

Details

An algorithm finding medians in local windows and smoothing with gaussian weighting

Value

baseline	Matrix of baselines corresponding to spectra spectra
corrected	Matrix of baseline corrected spectra

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

Mark S. Friedrichs: A model-free algorithm for the removal of baseline artifacts

Examples

```
data(milk)
bc.medianWindow <- baseline(milk$spectra[1,, drop=FALSE], hwm=300,
method='medianWindow')
## Not run:
plot(bc.medianWindow)

## End(Not run)
```

baseline.modpolyfit *Modified polynomial fitting*

Description

An implementation of CHAD A. LIEBER and ANITA MAHADEVAN-JANSENs algorithm for polynomial fitting

Usage

```
baseline.modpolyfit(spectra, t, degree = 4, tol = 0.001, rep = 100)
```

Arguments

spectra	Matrix with spectra in rows
t	Optional vector of spectrum abscissa
degree	Degree of polynomial
tol	Tolerance of difference between iterations
rep	Maximum number of iterations

Details

Polynomial fitting with baseline suppression relative to original spectrum

Value

baseline	Matrix of baselines corresponding to spectra spectra
corrected	Matrix of baseline corrected spectra

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

CHAD A. LIEBER and ANITA MAHADEVAN-JANSEN: Automated Method for Subtraction of Fluorescence from Biological Raman Spectra

Examples

```
data(milk)
bc.modpolyfit <- baseline(milk$spectra[1,, drop=FALSE], method='modpolyfit', deg=6)
## Not run:
plot(bc.modpolyfit)

## End(Not run)
```

baseline.peakDetection

Simultaneous Peak Detection and Baseline Correction

Description

A translation from Kevin R. Coombes et al.'s MATLAB code for detecting peaks and removing baselines

Usage

```
baseline.peakDetection(spectra, left, right, lwin, rwin, snminimum,
mono=0, multiplier=5, left.right, lwin.rwin)
```

Arguments

spectra	Matrix with spectra in rows
left	Smallest window size for peak widths
right	Largest window size for peak widths
lwin	Smallest window size for minimums and medians in peak removed spectra
rwin	Largest window size for minimums and medians in peak removed spectra
snminimum	Minimum signal to noise ratio for accepting peaks
mono	Monotonically decreasing baseline if mono>0
multiplier	Internal window size multiplier
left.right	Sets left and right to value of left.right
lwin.rwin	Sets lwin and rwin to value of lwin.rwin

Details

Peak detection is done in several steps sorting out real peaks through different criteria. Peaks are removed from spectra and minimums and medians are used to smooth the remaining parts of the spectra. If `snminimum` is omitted, `y3`, `midspec`, `y` and `y2` are not returned (faster)

Value

<code>baseline</code>	Matrix of baselines corresponding to spectra <code>spectra</code>
<code>corrected</code>	Matrix of baseline corrected spectra
<code>peaks</code>	Final list of selected peaks
<code>sn</code>	List signal to noise ratios for peaks
<code>y3</code>	List of peaks prior to signal to noise selection
<code>midspec</code>	Mid-way baseline estimation
<code>y</code>	First estimate of peaks
<code>y2</code>	Second estimate of peaks

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

KEVIN R. COOMBES et al.: Quality control and peak finding for proteomics data collected from nipple aspirate fluid by surface-enhanced laser desorption and ionization.

Examples

```
data(milk)
bc.peakDetection <- baseline(milk$spectra[1,, drop=FALSE], method='peakDetection',
left=300, right=300, lwin=50, rwin=50)
## Not run:
plot(bc.peakDetection)

## End(Not run)
```

baseline.rfbaseline *Robust Baseline Estimation*

Description

Wrapper for Andreas F. Ruckstuhl, Matthew P. Jacobson, Robert W. Field, James A. Dodd's algorithm based on LOWESS and weighted regression

Usage

```
baseline.rfbaseline(spectra, span = 2/3, NoXP = NULL, maxit = c(2, 2),
  b = 3.5, weight = NULL, Scale = function(r) median(abs(r))/0.6745,
  delta = NULL, SORT = FALSE, DOT = FALSE, init = NULL)
```

Arguments

spectra	Matrix with spectra in rows
span	Amount of smoothing (by fraction of points)
NoXP	Amount of smoothing (by number of points)
maxit	Maximum number of iterations in robust fit
b	Tuning constant in the biweight function
weight	Optional weights to be given to individual observations
Scale	S function specifying how to calculate the scale of the residuals
delta	Nonnegative parameter which may be used to save computation. (See rfbaseline)
SORT	Boolean variable indicating whether x data must be sorted.
DOT	Disregard outliers totally (boolean)
init	Values of initial fit

Details

Most of the code is the original code as given by the authors. The ability to sort by X-values has been removed and ability to handle multiple spectra has been added

Value

baseline	Matrix of baselines corresponding to spectra spectra
corrected	Matrix of baseline corrected spectra

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

Andreas F. Ruckstuhl, Matthew P. Jacobson, Robert W. Field, James A. Dodd: Baseline subtraction using robust local regression estimation

Examples

```
data(milk)
bc.rbe <- baseline(milk$spectra[1,, drop=FALSE], method='rfbaseline',
  span=NULL, NoXP=1000)
## Not run:
plot(bc.rbe)

## End(Not run)
```

baseline.rollingBall *Rolling ball*

Description

Ideas from Rolling Ball algorithm for X-ray spectra by M.A.Kneen and H.J. Annegarn. Variable window width has been left out

Usage

```
baseline.rollingBall(spectra, wm, ws)
```

Arguments

spectra	Matrix with spectra in rows
wm	Width of local window for minimization/maximization
ws	Width of local window for smoothing

Value

baseline	Matrix of baselines corresponding to spectra spectra
corrected	Matrix of baseline corrected spectra

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

M.A. Kneen, H.J. Annegarn: Algorithm for fitting XRF, SEM and PIXE X-ray spectra backgrounds

Examples

```
data(milk)
bc.rollingBall <- baseline(milk$spectra[1,, drop=FALSE], wm=200, ws=200,
method='rollingBall')
## Not run:
plot(bc.rollingBall)

## End(Not run)
```

baseline.shirley *Shirley Background Estimation*

Description

Shirley Background correction for X-ray Photoelectron Spectroscopy.

Usage

```
baseline.shirley(spectra, t = NULL, limits = NULL, maxit = 50, err = 1e-6)
```

Arguments

spectra	matrix with only 1 y-coordinates by rows (i.e.: y = spectra[1,])
t	Optional vector of spectrum abscissa
limits	list with the y coordinates between calculation of background. Ususally these are the extreme point of the data range.
maxit	max number of iteration
err	Tolerance of difference between iterations

Details

The shape of the spectrum background or baseline is affected by inelastic energy loss processes, secondary electrons and nearby peaks. A reasonable approximation is essential for a qualitative and quantitative analysis of XPS data especially if several components interfere in one spectrum. The choice of an adequate background model is determined by the physical and chemical conditions of the measurements and the significance of the background to the information to be obtained. The subtraction of the baseline before entering the fit iterations or the calculation of the peak area can be an acceptable approximation for simple analytical problems. In order to obtain chemical and physical parameters in detail, however, it is absolutely necessary to include the background function in the iterative peak fit procedure. The primary function $F(E)$ results from the experimentally obtained function $M(E)$ and the background function $U(E)$ as

$$F(E) = M(E) - U(E)$$

The kinetic energy E of the spectra can be described as

$$E = SE + SW * (i - 1)$$

SE means the start energy in eV, SW is the step width in eV and i the channel number. i can assume values between 1 and N with N as the number of data points.

In case of baseline calculation before initiating the fit procedure, the background is set to the averaged experimental function $M(E)$ in a sector around the chosen start and end channels. With i_1 as left channel (E_1 : low energy side) and i_2 as right channel (E_2 : high energy side) the simulation of the baseline is obtained as

$$U(E_1) = M(E_1)$$

and

$$U(E_2) = M(E_2)$$

If ZAP is the number of points used for averaging (can be set in the preferences), the intensity of the averaged measuring function at the low energy side is calculated by

$$M(i_1) = \frac{\sum_{i=0}^{ZAP-1} M(i_1 + i)}{ZAP}$$

and at the high energy side by

$$M(i_2) = \frac{\sum_{i=0}^{ZAP-1} M(i_2 + i)}{ZAP}$$

In many cases the Shirley model turned out to be a successful approximation for the inelastic background of core level peaks of buried species, which suffered significantly from inelastic losses of the emitted photoelectrons. The calculation of the baseline is an iterative procedure. The number of iteration cycles should be chosen high enough so that the shape of the obtained background function does not change anymore. The analytical expression for the Shirley background is

$$U(E) = \int_E^{\infty} F(E') dE' + c$$

The algorithm of Proctor and Sherwood ([1] A. Proctor, P.M.A. Sherwood, Anal. Chem. 54 (1982) 13) is based on the assumption that for every point of the spectrum the background intensity generated by a photoelectron line is proportional to the number of all photoelectrons with higher kinetic energy. The intensity of the background U(i) in channel i is given by

$$U(i) = \frac{(a - b)Q(i)}{P(i) + Q(i)} + b$$

where a and b are the measured intensities in channel i_1 and i_2 , respectively, and P(i) and Q(i) represent the effective peak areas to lower and higher kinetic energies relative to the channel under consideration. An iterative procedure is necessary because P, Q, and U(i) are unknown. In first approximation U(i) = b is used.

The function `baseline.shirley` implements the shirley baseline. It is an iterative algorithm. The iteration stops when the deviation between two consequent iteration is lower than `err` or when the max number of iterations `maxit` is reached.

Value

The baseline function return an object of class `baseline`.

Data <- 01s

## The same example with C1s data
# data("C1s")
# Data <- C1s

Y <- Data[2,, drop = FALSE]
X <- Data[1,]

corrected <- baseline(Y, method = "shirley", t = X)
plot(corrected, rev.x = TRUE, labels = X)

## Not run:
# Dependent on external software
baselineGUI(Y, labels=X, method="shirley")

## End(Not run)
```

baseline.TAP

TAP

Description

An implementation of Roman Svoboda and Jirí Málek's algorithm for baseline identification in kinetic analysis of derivative kinetic data.

Usage

```
baseline.TAP(spectra, t, interval = 15, tol = 0.001)
```

Arguments

spectra	Matrix with spectra in rows
t	Optional vector of spectrum abscissa
interval	Distance from spectrum end to starting points for the TAP (default = 15)
tol	Tolerance of difference between iterations (default = 0.001)

Details

(i) A first approximation of the baseline equation is selected as the straight line between start and end of the curve. (ii) Based on the first approximation of the baseline equation, the phase change progress parameter is calculated. (iii) An updated equation of the baseline is calculated and the phase change progress parameter equation from step (ii). (iv) The baseline equation from step (iii) is compared (point by point) with the one from the previous iteration. If the convergence criterion is met (the difference between every baseline value corresponding to two successive iterations was less than 0.1%) the procedure is stopped and the final baseline equation is selected. If the convergence criterion is not fulfilled then a new iteration is carried out from step (ii) until convergence was achieved.

Value

baseline	Matrix of baselines corresponding to spectra spectra
corrected	Matrix of baseline corrected spectra

# Plot
plot(B, xlab = "T", ylab = "da/dT")
```

baselineAlg-class	Class "baselineAlg"
-------------------	---------------------

Description

A class that describes a baseline correction algorithm. The idea is that it contains all information needed to use an algorithm with the optimisation framework and the graphical user interface (but see Notes below).

Objects from the Class

Objects can be created by calls of the form `new("baselineAlg", ...)`.

Slots

name: Short-name of the algorithm. This must match the name of the object in the `baselineAlgorithms` list of algorithms, and is used throughout the code to identify the algorithm. It should thus start with a letter and contain only letters, digits, underscores ("`_`") or dots ("`.`").

description: Description of the algorithm, typically the full name. This will be used in the code to describe the algorithm, so it should not be too long, and not contain newline characters.

funcName: The name of the function used to estimate the baseline. The function must take an argument `spectra`, and return a list with the estimated baselines (`baseline`) original spectra (`spectra`) and the corrected spectra (`corrected`). It can also take other arguments (typically parameters) and return additional components in the list.

param: A data frame with information about the parameters of the algorithm. It should contain the following columns: `name` - the name of the parameter; `integer` - TRUE if the parameter only takes integer values, otherwise FALSE; `min` - the lower limit of allowed values; `incl.min` - TRUE if the lower limit is an allowed value, otherwise FALSE; `default` - the default value; `max` - the upper limit of allowed values; `incl.max` - TRUE if the upper limit is an allowed value, otherwise FALSE

Methods

description signature(object = "baselineAlg"): Extract the description slot

funcName signature(object = "baselineAlg"): Extract the funcName slot

name signature(object = "baselineAlg"): Extract the name slot

param signature(object = "baselineAlg"): Extract the param slot

Note

The goal is that the optimisation framework and the GUI code should get all information about available baseline algorithms through a list of `baselineAlg` objects. This will make it relatively simple to add new baseline algorithms.

Currently, there is information about the algorithms spread around in the code. We plan to move that information into the `baselineAlg` objects, and expand the class accordingly.

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

Examples

```
showClass("baselineAlg")
```

baselineAlgorithms *List of available baseline algorithms*

Description

A list with descriptions of all baseline algorithms available through the optimisaion framework and graphical user interface. The elements of the list are `baselineAlg` objects. The list is used by the code to extract names and information about the baseline algorithms.

Details

The list is not meant for usage by end-users, but is extendable and customizable, allowing for extra algorithms or removal of algorithms.

The names of the list must match the name slot of the elements.

Examples

```
## Get a list of all algorithms:
names(baselineAlgorithms)
## Show the descriptions
sapply(baselineAlgorithms, description)
## Add new algorithm
baseline.my.alg <- function(spectra, kappa=1, gamma=1){
  baseline <- spectra-kappa+gamma
  corrected <- spectra-baseline
  list(baseline=baseline,corrected=corrected)
}

baselineAlgorithms$my.alg = new("baselineAlg",
  name = "my.alg",
  description = "A new baseline correction algorithm",
  funcName = "baseline.my.alg",
  param = data.frame(
    name = c("kappa","gamma"), # maxit
    integer = c(FALSE, FALSE),
    min = c(0, 0),
    incl.min = c(TRUE, TRUE),
    default = c(1, 1),
    max = c(Inf, 1),
    incl.max = c(FALSE, TRUE)
  ))
```

baselineAlgorithmsGUI *List of available baseline algorithms for GUI function*

Description

A list with data.frames containing parameters, minimum and maximum values for GUIs, step lengths for sliders, default values and currently selected values, plus a short description of each parameter. The list is used by the GUIs, and is user customizable.

Details

The list is not meant for usage by end-users, but is extendable and customizable, allowing for extra algorithms, removal of algorithms or changing of parameter sets.

Examples

```
## Get a list of all algorithms:
names(baselineAlgorithmsGUI)
## Add new algorithm:
baselineAlgorithmsGUI$my.alg <- as.data.frame(matrix(c(0,20,1,1, 0,20,1,1), 2,4, byrow=TRUE))
dimnames(baselineAlgorithmsGUI$my.alg) <- list(par=c("kappa", "gamma"),
val=c("min", "max", "step", "default"))
baselineAlgorithmsGUI$my.alg$current <- c(1,1)
baselineAlgorithmsGUI$my.alg$name <- c("Subtractive constant", "Additive constant")
```

baselineAlgResult-class
Class "baselineAlgResult"

Description

A class describing the result of a baseline algorithm test

Objects from the Class

Objects are typically created by running runTest on a [baselineAlgTest](#) object.

Slots

param: A named list with the parameter values that were tested. This includes both the predictor parameters and the baseline algorithm parameters. All combinations of values are tested.

qualMeas: A matrix of quality measure values for the different combinations of parameter values. Each row corresponds to one prediction parameter value, and each column to one combination of baseline parameters.

qualMeas.ind.min: The index in qualMeas of the minimum quality measure value

minQualMeas: The minimum quality measure value
param.ind.min: A vector of indices into the elements of param of the parameter values corresponding to the minimum quality measure value
param.min: A list of the parameter values corresponding to the minimum quality measure value
qualMeasName: The name of the quality measure

Methods

minQualMeas signature(object = "baselineAlgResult"): Extract the minQualMeas slot
param signature(object = "baselineAlgResult"): Extract the param slot
param.ind.min signature(object = "baselineAlgResult"): Extract the param.ind.min slot
param.min signature(object = "baselineAlgResult"): Extract the param.min slot
qualMeas signature(object = "baselineAlgResult"): Extract the qualMeas slot
qualMeas.ind.min signature(object = "baselineAlgResult"): Extract the qualMeas.ind.min slot
qualMeasName signature(object = "baselineAlgResult"): Extract the qualMeasName slot

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

Class [baselineAlgTest](#), function `runTest`.

Examples

```
showClass("baselineAlgResult")
```

```
baselineAlgTest-class  Class "baselineAlgTest"
```

Description

A class that describes a baseline algorithm test. The test is performed with the function `runTest`.

Objects from the Class

Objects can be created by calls of the form `new("baselineAlgTest", ...)`.

Slots

algorithm: A "baselineAlg" object. The baseline algorithm to test.
param: A named list with parameter values to test. All combinations of parameters are tested.
extraArgs: A named list of extra parameters to the baseline algorithm. These will be held fixed during the testing.

Methods

algorithm signature(object = "baselineAlgTest"): Extract the algorithm slot
extraArgs signature(object = "baselineAlgTest"): Extract the extraArgs slot ...
funcName signature(object = "baselineAlgTest"): Extract the funcName slot ...
param signature(object = "baselineAlgTest"): Extract the param slot
runTest signature(object = "baselineAlgTest"): Run the test.

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

Classes [baselineAlg](#), [baselineAlgResult](#). Function [runTest](#).

Examples

```
showClass("baselineAlgTest")
```

baselineEnv

Baseline environment

Description

Methods to access the baseline environment.

Usage

```
baselineEnv()  
getBaselineEnv(x, mode="any")  
putBaselineEnv(x, value)
```

Arguments

x	Name of object to put/get.
mode	Mode of object to get.
value	Object to put.

Value

getBaseline retrieves an object.

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

See Also

The functions implementing the baseline algorithms: [baseline.als](#), [baseline.fillPeaks](#), [baseline.irls](#), [baseline.lowpass](#), [baseline.medianWindow](#), [baseline.modpolyfit](#), [baseline.peakDetection](#), [baseline.rfbaseline](#), [baseline.rollingBall](#)

Examples

```
putBaselineEnv('fish', '<==x-<')
getBaselineEnv('fish')
```

baselineGUI

Interactive plotting tool

Description

An interactive plotting tool for dynamic visualization of baselines and their effect using the gWid-gets2 package with GTK+ or Tcl/Tk.

Usage

```
baselineGUI(spectra, method='irls', labels, rev.x = FALSE)
```

Arguments

spectra	Matrix with spectra in rows
method	Baseline correction method (optional)
labels	Labels for X-axis (optional)
rev.x	Reverse X-axis (optional, default=FALSE)

Details

Creates and updates a list containing current baseline and spectrum (baseline.result). Make sure a gWidget2 implementation is available, e.g gWidgets2RGtk2 or gWidgets2tcltk and a corresponding backend like GTK+ or Tcl/Tk. The GUI was developed using GTK which is an external dependency in Windows and OS X.

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

Examples

```
data(milk)
## Not run:
# Dependent on external software
baselineGUI(milk$spectra)

## End(Not run)
```

custom.baseline	<i>Customized baseline correction</i>
-----------------	---------------------------------------

Description

This function rescales spectrum abscissa by use of breaks and gaps before baseline correction. The effect is that the chosen baseline correction algorithm and parameters will have varying effects along the spectra, effectively giving local control of the amount of rigidity/flexibility of the estimated baseline.

Usage

```
custom.baseline(spectra, breaks, gaps, trans.win = NULL, just.plot = FALSE, method, ...)
```

Arguments

spectra	Matrix with spectra in rows.
breaks	Vector of locations of break points between sections of varying baseline flexibility (given as abscissa numbers).
gaps	Vector giving the abscissa spacing between each instance of breaks (and endpoints if not specified in breaks).
trans.win	Optional width of transition window around break points used for smoothing rough breaks by LOWESS (default = NULL).
just.plot	Plot the rescaled spectra instead of applying the customized baseline correction if just.plot=TRUE (default = FALSE).
method	Baseline correction method to use (class character).
...	Additional named arguments to be passed to the baseline correction method.

Details

This is an implementation of the customized baseline correction suggested by Liland et al. 2011 for local changes in baseline flexibility.

Value

baseline	Estimated custom baselines.
corrected	Spectra corrected by custom baselines.
spectra.scaled	Re-scaled spectra.
baseline.scaled	Estimated baselines of re-scaled spectra.

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

References

Kristian Hovde Liland et al.: Customized baseline correction

Examples

```
data(milk)
spectrum1 <- milk$spectra[1,1:10000,drop=FALSE]
ordinary <- baseline(spectrum1, method="als", lambda=6, p=0.01)
customized <- custom.baseline(spectrum1, 2900, c(1,20), trans.win=100,
just.plot=FALSE, method="als", lambda=6, p=0.01)
## Not run:
plot(1:10000,spectrum1, type='l')
lines(1:10000,getBaseline(ordinary), lty=2, col=2, lwd=2)
lines(1:10000,customized$baseline, lty=3, col=3, lwd=2)

## End(Not run)
```

doOptim

Optimise several baseline algorithms on a data set

Description

Tests several baseline algorithms with one predictor for a given data set. The baseline algorithms are represented as a list of [baselineAlgTest](#) objects, and the predictor as a [predictionTest](#) object.

Usage

```
doOptim(baselineTests, X, y, predictionTest, postproc = NULL,
        tmpfile = "tmp.baseline", verbose = FALSE, cleanTmp = FALSE)
```

Arguments

baselineTests	a list of baselineAlgTest objects. The baseline algorithms and parameter values to test
X	A matrix. The spectra to use in the test
y	A vector or matrix. The response(s) to use in the test
predictionTest	A predictionTest object. The predictor and parameter values to use in the test
postproc	A function, used to postprocess the baseline corrected spectra prior to prediction testing. The function should take a matrix of spectra as its only argument, and return a matrix of postprocessed spectra
tmpfile	The basename of the files used to store intermediate calculations for checkpointing. Defaults to "tmp.baseline"
verbose	Logical, specifying whether the test should print out progress information. Default is FALSE
cleanTmp	Logical, specifying whether the intermediate files should be deleted when the optimisation has finished. Default is FALSE

Details

The function loops through the baseline algorithm tests in `baselineTests`, testing each of them with the given data and prediction test, and collects the results. The results of each baseline algorithm test is saved in a temporary file so that if the optimisation is interrupted, it can be re-run and will use the pre-calculated results. If `cleanTmp` is `TRUE`, the temporary files are deleted when the whole optimisation has finished.

Value

A list with components

<code>baselineTests</code>	The <code>baselineTests</code> argument
<code>results</code>	A list with the <code>baselineAlgResult</code> objects for each baseline test
<code>minQualMeas</code>	The minimum quality measure value
<code>baselineAlg.min</code>	The name of the baseline algorithm giving the minimum quality measure value
<code>param.min</code>	A list with the parameter values corresponding to the minimum quality measure value

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

[baselineAlgTest](#), [predictionTest](#)

<code>funcName</code>	<i>Extract the "funcName" slot.</i>
-----------------------	-------------------------------------

Description

Extract the `funcName` slot from an object of class [baselineAlg](#) or [baselineAlgTest](#)

Usage

```
funcName(object)
```

Arguments

<code>object</code>	An object of class baselineAlg or baselineAlgTest
---------------------	---

Value

The `funcName` slot of the object.

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

[baselineAlg](#), [baselineAlgTest](#)

getBaseline

Functions to extract the components of a "baseline" object

Description

The functions extract the baseline, spectra, corrected or call slot of a [baseline](#) object; usually the result of a call to [baseline](#).

Usage

```
getBaseline(object)
getSpectra(object)
getCorrected(object)
getCall(object)
```

Arguments

object A [baseline](#) object

Value

getCall returns the baseline call used to create the object. The other functions return a matrix with the original spectra, estimated baselines or corrected spectra.

Warning

In a future version, one of the slots might be removed from the class definition and calculated on the fly instead, in order to save space. Therefore, *do* use the extractor functions (getSpectra, getBaseline and getCorrected) instead of accessing the slots directly.

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

The function [baseline](#), the class [baseline](#)

Examples

```
data(milk)
bl <- baseline(milk$spectra[1:2,])
baseline <- getBaseline(bl)
spectra <- getSpectra(bl)
corrected <- getCorrected(bl)
call <- getCall(bl)
```

ind.min

Extraction methods specific for "predictionResult" objects

Description

Extract information from objects of class `predictionResult`.

Usage

```
ind.min(object)
paramName(object)
```

Arguments

object Object of class `predictionResult`

Value

The corresponding slot of the object.

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

`predictionResult`

milk	<i>MALDI-TOF mass spectra</i>
------	-------------------------------

Description

Matrix of 45 spectra of 21451 m/z values from MALDI-TOF on mixed milk samples.

Usage

```
data(milk)
```

Format

A data frame with 45 observations on the following 2 variables.

cow a numeric vector

spectra a matrix with 21451 columns

Details

cow is the concentration of cow milk in mixed samples of cow, goat, and ewe milk.

References

Kristian Hovde Liland, Bjørn-Helge Mevik, Elling-Olav Rukke, Trygve Almøy, Morten Skaugen and Tomas Isaksson (2009) Quantitative whole spectrum analysis with MALDI-TOF MS, Part I: Measurement optimisation. *Chemometrics and Intelligent Laboratory Systems*, **96**(2), 210–218.

Examples

```
data(milk)
## Not run:
plot(milk$spectra[1,], type = "l")

## End(Not run)
```

name	<i>Extraction methods for "baselineAlg" objects</i>
------	---

Description

Extraction methods specifically for objects of class `baselineAlg`

Usage

```
name(object)
description(object)
```

Arguments

object Object of class `baselineAlg`

Value

The methods return the corresponding slot of the object.

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

`baselineAlg`, `funcName`.

optimWizard *Visual tool for setting up optimization*

Description

Set up optimization through a graphical user interface. Optionally collecting values directly from 'baselineGUI'. Retrieve optimisation parameters and results with `getOptim` and `getOptimRes`, respectively.

Usage

```
optimWizard(X, y, postproc, predictionTest, cvsegments)
getOptim()
getOptimRes()
```

Arguments

X Matrix with spectra in rows
y Response vector or matrix in analysis
postproc Custom function for post processing of spectra (optional)
predictionTest Custom prediction object (optional)
cvsegments Cross-validation segments (optional)

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

Examples

```
## Not run:
# Computationally intensive
data(milk)
X <- milk$spectra[,-1]
y <- milk$spectra[,1]
optimWizard(X,y)

# After optimisation is complete
plotOptim(myResults)

## End(Not run)
```

overall.min

Extract the minimum from a baseline optimisation

Description

Takes the result of an optimisation (a call to [doOptim](#)) and extracts the minimum quality measure value along with the parameters giving rise to the value.

Usage

```
overall.min(results)
```

Arguments

results Result of call to [doOptim](#)

Value

A list with components

qualMeas The minimum quality measure value

algorithm The name of the baseline algorithm corresponding to the minimum

param A list with the parameter values corresponding to the minimum quality measure value

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

[doOptim](#)

param	<i>Extract the "param" slot</i>
-------	---------------------------------

Description

Extracts the param slot of the object.

Usage

```
param(object)
```

Arguments

object An object of class [baselineAlg](#), [baselineAlgTest](#), [baselineAlgResult](#) or [predictionResult](#).

Value

The param slot of the object. Usually a data frame, list or numeric.

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

Classes [baselineAlg](#), [baselineAlgTest](#), [baselineAlgResult](#), [predictionResult](#)

param.ind.min	<i>Extraction methods for "baselineAlgResult" objects</i>
---------------	---

Description

Extraction methods that are specific for objects of class [baselineAlgResult](#)

Usage

```
param.ind.min(object)
qualMeas.ind.min(object)
```

Arguments

object Object of class [baselineAlgResult](#)

Value

The corresponding slot

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

Class [baselineAlgResult](#)

plotBaseline *Plot method for "baseline" objects*

Description

Plot the original spectrum, the estimated baseline, and the corrected spectrum. Optionally zoom and pan plot, either with arguments or interactively.

Usage

```
## S4 method for signature 'baseline'
plot(x, y, specNo = 1, grid = FALSE, labels = 1:n, rev.x = FALSE,
     zoom = NULL, ...)
plotBaseline(x, y, specNo = 1, grid = FALSE, labels = 1:n, rev.x = FALSE,
            zoom = list(xz = 1, yz = 1, xc = 0, yc = 0), ...)
```

Arguments

x	The baseline object to be plotted
y	Unused. Ignored with a warning
specNo	The row number of the spectrum and baseline to plot. Defaults to 1
grid	Logical. Whether to show a grid or not. Defaults to FALSE
labels	Vector. Labels for the x tick marks. Defaults to 1:n
rev.x	Logical. Whether the spectrum should be reversed. Defaults to FALSE
zoom	Either TRUE (only for the plot method), which turns on the interactive zoom controls, or a list with components xz, xc, yz and yc, which specifies the desired zoom and pan. Defaults to no zoom or pan
...	Other arguments. Currently ignored

Details

The normal way to plot baseline objects is to use the plot method. The plotBaseline function is the underlying work-horse function, and is not meant for interactive use.

Note

Because the argument list of any plot method must start with x, y, and the plot method for the baseline class does not use the y argument, all arguments except x must be named explicitly. Positional matching will not work.

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

See Also

[baseline](#), [baseline](#), [baselineGUI](#)

Examples

```
data(milk)
bl <- baseline(milk$spectra[1,, drop=FALSE])
## Not run:
# Computationally intensive
plot(bl)
plot(bl, zoom = TRUE)
## End(Not run)
```

plotOptim

Plotting tool for result objects from optimization

Description

A graphical user interface for plotting optimisation results, either one algorithm at the time or comparing algorithms.

Usage

```
plotOptim(results)
```

Arguments

results Result list from optimization

Details

plotOptim creates a user interface based on the supplied results. Curve and level plots from single algorithms or comparison of algorithms is available.

For single algorithms subsets, levels corresponding to local or global minima, and averages can be extracted for plotting. For comparison of algorithms levels corresponding to local or global minima can be used, or levels corresponding to the minimum when averaging over selected values of the regression parameter, e.g. selected components in PLSR.

Author(s)

Kristian Hovde Liland and Bjørn-Helge Mevik

PLSRTest-class	<i>Class "PLSRTest"</i>
----------------	-------------------------

Description

A class describing a PLSR prediction test. To run the test, the "pls" package must be installed.

Objects from the Class

Objects can be created by calls of the form `new("PLSRTest", ...)`.

Slots

ncomp: Integer vector. The number of PLSR components to test

cvsegments: A list of the segments to use in the cross-validation

Extends

Class [predictionTest](#), directly.

Methods

runTest signature(object = "PLSRTest"): Run the test

Author(s)

Bjørn-Helge Mevik and Krisitan Hovde Liland

See Also

The base class [predictionTest](#). The [runTest](#) function. The [pls](#) function from the "pls" package.

Examples

```
showClass("PLSRTest")
```

predictionResult-class
Class "predictionResult"

Description

A class containing the result of running a [predictionTest](#).

Objects from the Class

The normal way to create objects is by calling the method `runTest` for any object of subclass of [predictionTest](#).

Slots

param: Numeric vector. The regression parameter values tested.
qualMeas: Numeric vector. The quality measure values for each of the values of the `param` slot
ind.min: The index (into `qualMeas`) of the minimum quality measure value
minQualMeas: The minimum quality measure value
param.min: The value of the parameter value corresponding to the minimum quality measure value
qualMeasName: The name of the quality measure
paramName: The name of the regression parameter

Methods

ind.min signature(object = "predictionResult"): Extract the `ind.min` slot
minQualMeas signature(object = "predictionResult"): Extract the `minQualMeas` slot
param signature(object = "predictionResult"): Extract the `param` slot
param.min signature(object = "predictionResult"): Extract the `param.min` slot
paramName signature(object = "predictionResult"): Extract the `paramName` slot
qualMeas signature(object = "predictionResult"): Extract the `qualMeas` slot
qualMeasName signature(object = "predictionResult"): Extract the `qualMeasName` slot

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

Function `runTest`, class [predictionTest](#), subclasses [PLSRTest](#) and [ridgeRegressionTest](#)

Examples

```
showClass("predictionResult")
```

predictionTest-class *Class "predictionTest"*

Description

A virtual class for all predictor test subclasses. Currently subclasses [PLSRTest](#) and [ridgeRegressionTest](#) are defined.

Objects from the Class

A virtual Class: No objects may be created from it.

Methods

No methods defined with class "predictionTest" in the signature.

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

Subclasses [PLSRTest](#) and [ridgeRegressionTest](#).

qualMeas *Extraction functions for "predictionResult" or "baselineAlgResult" objects*

Description

Extract slots from objects of class [predictionResult](#) or [baselineAlgResult](#).

Usage

```
qualMeas(object, ...)
## S4 method for signature 'predictionResult'
qualMeas(object, ...)
## S4 method for signature 'baselineAlgResult'
qualMeas(object, ..., MIN, AVG,
  DEFAULT = c("all", "cond.min", "overall.min", "avg"))
minQualMeas(object)
param.min(object)
qualMeasName(object)
```

Arguments

object	An object of class predictionResult or baselineAlgResult
MIN	List or vector of parameter names to take the minimum over. Not used if DEFAULT is "cond.min". See Details
AVG	List or vector of parameter names to take the average over. Not used if DEFAULT is "avg". See Details
DEFAULT	Character string. The default way to calculate the minimum (or average) for all parameters. See Details
...	Other arguments. Selection of subsets of parameter levels. See Details

Details

The arguments to the [baselineAlgResult](#) method are interpreted in the following way:

Subsets of parameters levels can be selected by supplying their names and specifying the level indices as vectors. Substituting a vector with "all" will return all levels of the corresponding parameter, and substituting it with "overall" will return the level corresponding to the overall minimum. Minimum and average values for selected parameters can be chosen using MIN and AVG, respectively, together with a vector of parameter names.

DEFAULT specifies the action for each remaining parameters: If "all" (default): returns all levels. If "cond.min": take minimum for each remaining parameter (MIN is not used). If "overall.min": set any remaining parameters to their value corresponding to the overall min. If "avg": take average for each remaining parameter (AVG is not used).

Value

The qualMeas method for [baselineAlgResult](#) objects returns the subsets or minimum values of the qualMeas slot of the object as specified above. All other methods simply return the corresponding slot.

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

Function [runTest](#), classes [baselineAlgResult](#) and [predictionResult](#)

ridgeRegressionTest-class

Class "ridgeRegressionTest"

Description

A class describing a ridge regression test.

Objects from the Class

Objects can be created by calls of the form `new("ridgeRegressionTest", ...)`.

Slots

`lambda`: Numeric vector. The smoothing parameter values to test

Extends

Class `predictionTest`, directly.

Methods

runTest signature(object = "ridgeRegressionTest"): Run the test

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

The base class `predictionTest`. The `runTest` function.

Examples

```
showClass("ridgeRegressionTest")
```

runTest	<i>Run a predictionTest or baselineAlgTest</i>
---------	--

Description

Runs the test defined in a `predictionTest` or `baselineAlgTest` object

Usage

```
runTest(object, X, y, ...)
## S4 method for signature 'PLSRTest'
runTest(object, X, y)
## S4 method for signature 'ridgeRegressionTest'
runTest(object, X, y)
## S4 method for signature 'baselineAlgTest'
runTest(object, X, y, predictionTest, postproc, verbose = FALSE)
```

Arguments

object	An object of class <code>baselineAlgTest</code> or subclass of <code>predictionTest</code> (currently <code>PLSRTest</code> or <code>ridgeRegressionTest</code>). The object specify the test to be run
X	A matrix. The spectra to use in the test
y	A vector or matrix. The response(s) to use in the test
predictionTest	A <code>predictionTest</code> object, describing the prediction test to use for this baseline algorithm test
postproc	A function, used to postprocess the baseline corrected spectra prior to prediction testing. The function should take a matrix of spectra as its only argument, and return a matrix of postprocessed spectra
verbose	Logical, specifying whether the test should print out progress information. Default is FALSE
...	Other arguments. Currently only used by the <code>baselineAlgTest</code> method.

Value

`runTest` returns an object of class `predictionResult` or `baselineAlgResult`.

Methods

`signature(object = "baselineAlgTest")` Baseline corrects the spectra, optionally postprocesses them, and runs a prediction test on the corrected spectra.

`signature(object = "PLSRTest")` Runs PLSR on the data and calculates the cross-validated RMSEP

`signature(object = "ridgeRegressionTest")` Runs ridge regression on the data and calculates the GCV

Author(s)

Bjørn-Helge Mevik and Kristian Hovde Liland

See Also

`baselineAlgTest`, `predictionTest`, `PLSRTest`, `ridgeRegressionTest`

XPSdata

XPS core line data

Description

Matrix of x,y values from X-Ray Photoelectron Spectroscopy on test sample. The data are about the Carbon and Oxygen element for 1s shell.

Usage

```
data(C1s)
data(O1s)
```

Format

A matrix with the following 2 variables (rows).

first row is the abscissa, (Binding Energy [eV])

second row is the Intensity, (a.u.)

See Also

[baseline.shirley](#)

Examples

```
data(C1s)
data(O1s)
plot(C1s[1,], C1s[2,], type = "l")
plot(O1s[1,], O1s[2,], type = "l")
```
