Package 'beautier'

August 5, 2020

Title 'BEAUti' from R

Version 2.3.7

Maintainer Richèl J.C. Bilderbeek <richel@richelbilderbeek.nl>

Description 'BEAST2' (<https://www.beast2.org>) is a widely used Bayesian phylogenetic tool, that uses DNA/RNA/protein data and many model priors to create a posterior of jointly estimated phylogenies and parameters.
'BEAUti 2' (which is part of 'BEAST2') is a GUI tool that allows users to specify the many possible setups and generates the XML file 'BEAST2' needs to run.
This package provides a way to create 'BEAST2' input files without active user input, but using R function calls instead.

License GPL-3

LazyData true

`are_clock_models` *Determine if x consists out of clock_models objects*

Description

Determine if x consists out of clock_models objects

Usage

```
are_clock_models(x)
```

Arguments

x	the object to check if it consists out of clock_models objects

Value

TRUE if x, or all elements of x, are clock_model objects

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

rln_clock_model <- create_rln_clock_model()
strict_clock_model <- create_strict_clock_model()
both_clock_models <- list(rln_clock_model, strict_clock_model)
expect_true(are_clock_models(rln_clock_model))
expect_true(are_clock_models(strict_clock_model))
expect_true(are_clock_models(both_clock_models))

expect_false(are_clock_models(NA))
expect_false(are_clock_models(NULL))
expect_false(are_clock_models("nonsense"))
expect_false(are_clock_models(create_jc69_site_model()))
```

---

are_equal_mcmcs *Determine if two MCMCs are equal.*

Description

Will stop if the arguments are not MCMCs.

Usage

```
are_equal_mcmcs(mcmc_1, mcmc_2)
```

Arguments

mcmc_1	an MCMC, as created by create_mcmc
mcmc_2	an MCMC, as created by create_mcmc

Value

TRUE if the two MCMCs are equal

Author(s)

Richèl J.C. Bilderbeek

See Also

Use `create_mcmc` to create an MCMC

Examples

```
library(testthat)

mcmc_1 <- create_mcmc(chain_length = 1000)
mcmc_2 <- create_mcmc(chain_length = 314)
expect_true(are_equal_mcmcs(mcmc_1, mcmc_1))
expect_false(are_equal_mcmcs(mcmc_1, mcmc_2))
```

`are_equal_screenlogs` *Determine if two screenlogs are equal.*

Description

Will stop if the arguments are not screenlogs.

Usage

```
are_equal_screenlogs(screenlog_1, screenlog_2)
```

Arguments

`screenlog_1`	an screenlog, as created by create_screenlog
`screenlog_2`	an screenlog, as created by create_screenlog

Value

TRUE if the two screenlogs are equal

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_screenlog to create an screenlog

Examples

```
library(testthat)

screenlog_1 <- create_screenlog(log_every = 1000)
screenlog_2 <- create_screenlog(log_every = 314)
expect_true(are_equal_screenlogs(screenlog_1, screenlog_1))
expect_false(are_equal_screenlogs(screenlog_1, screenlog_2))
```

---

are_equal_tracelogs *Determine if two tracelogs are equal.*

Description

Will stop if the arguments are not tracelogs.

Usage

```
are_equal_tracelogs(tracelog_1, tracelog_2)
```

Arguments

tracelog_1	an tracelog, as created by create_tracelog
tracelog_2	an tracelog, as created by create_tracelog

Value

TRUE if the two tracelogs are equal

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_tracelog to create an tracelog

Examples

```
library(testthat)

tracelog_1 <- create_tracelog(log_every = 1000)
tracelog_2 <- create_tracelog(log_every = 314)
expect_true(are_equal_tracelogs(tracelog_1, tracelog_1))
expect_false(are_equal_tracelogs(tracelog_1, tracelog_2))
```

`are_equal_treelogs` *Determine if two treelogs are equal.*

Description

Will stop if the arguments are not treelogs.

Usage

```
are_equal_treelogs(treelog_1, treelog_2)
```

Arguments

`treelog_1`	an treelog, as created by create_treelog
`treelog_2`	an treelog, as created by create_treelog

Value

TRUE if the two treelogs are equal

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_treelog to create an treelog

Examples

```
library(testthat)

treelog_1 <- create_treelog(log_every = 1000)
treelog_2 <- create_treelog(log_every = 314)
expect_true(are_equal_treelogs(treelog_1, treelog_1))
expect_false(are_equal_treelogs(treelog_1, treelog_2))
```

are_equal_xml_files *Determine if XML files result in equal trees*

Description

Determine if XML files result in equal trees

Usage

```
are_equal_xml_files(filename_1, filename_2, section)
```

Arguments

filename_1	name of a first XML file
filename_2	name of a second XML file
section	name of an XML section. Assumes that there is one line that starts with <section (excluding whitespace) and one line that is </section> (also excluding whitespace)

Value

TRUE if the two sections of the XML files are equal, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

to check for equivalence, use are_equivalent_xml_files

are_equal_xml_lines *Determine if XML lines result in equal trees*

Description

Determine if XML lines result in equal trees

Usage

```
are_equal_xml_lines(lines_1, lines_2, section)
```

Arguments

lines_1	lines of a first XML file
lines_2	lines of a second XML file
section	name of an XML section. Assumes that there is one line that starts with <section (excluding whitespace) and one line that is </section> (also excluding whitespace)

Value

TRUE if the two sections of the XML files are equal, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

---

are_equivalent_xml_files

Determine if XML files result in equivalent trees

Description

Determine if XML files result in equivalent trees

Usage

```
are_equivalent_xml_files(filename_1, filename_2, section = NA)
```

Arguments

filename_1	name of a first XML file
filename_2	name of a second XML file
section	the name of the XML section, use NA to check the whole file

Value

TRUE if the two XML files result in equivalent trees, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

to check for equality, use are_equal_xml_files

`are_equivalent_xml_lines` *Determine if XML lines result in equivalent trees*

Description

Determine if XML lines result in equivalent trees

Usage

```
are_equivalent_xml_lines(lines_1, lines_2, section = NA, verbose = FALSE)
```

Arguments

`lines_1`	lines of a first XML file
`lines_2`	lines of a second XML file
`section`	the name of the XML section
`verbose`	if TRUE, additional information is displayed, that is potentially useful in debugging

Value

TRUE if the two XML lines result in equivalent trees, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

`are_equivalent_xml_lines_all` *Determine if XML lines result in equivalent trees*

Description

Determine if XML lines result in equivalent trees

Usage

```
are_equivalent_xml_lines_all(lines_1, lines_2, verbose = FALSE)
```

Arguments

`lines_1`	lines of a first XML file
`lines_2`	lines of a second XML file
`verbose`	if TRUE, additional information is displayed, that is potentially useful in debugging

Value

TRUE if the two XML lines result in equivalent trees, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

`are_equivalent_xml_lines_loggers` *Determine if XML operator lines result in equivalent trees*

Description

Determine if XML operator lines result in equivalent trees

Usage

```
are_equivalent_xml_lines_loggers(lines_1, lines_2, verbose = FALSE)
```

Arguments

`lines_1`	lines of a first XML file
`lines_2`	lines of a second XML file
`verbose`	if TRUE, additional information is displayed, that is potentially useful in debugging

Value

TRUE if the two XML lines result in equivalent trees, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

are_equivalent_xml_lines_operators

Determine if XML operator lines result in equivalent trees

Description

Determine if XML operator lines result in equivalent trees

Usage

```
are_equivalent_xml_lines_operators(lines_1, lines_2, verbose = FALSE)
```

Arguments

lines_1	lines of a first XML file
lines_2	lines of a second XML file
verbose	if TRUE, additional information is displayed, that is potentially useful in debugging

Value

TRUE if the two XML lines result in equivalent trees, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

are_equivalent_xml_lines_section

Determine if XML lines result in equivalent trees

Description

Determine if XML lines result in equivalent trees

Usage

```
are_equivalent_xml_lines_section(lines_1, lines_2, section, verbose = FALSE)
```

Arguments

lines_1	lines of a first XML file
lines_2	lines of a second XML file
section	the name of the XML section
verbose	if TRUE, additional information is displayed, that is potentially useful in debugging

Value

TRUE if the two XML lines result in equivalent trees, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

---

are_fasta_filenames *Checks if all filenames have a FASTA filename extension*

Description

Checks if all filenames have a FASTA filename extension

Usage

```
are_fasta_filenames(filenames)
```

Arguments

filenames	filenames

Value

TRUE if all filenames have a FASTA filename extension

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(are_fasta_filenames("1.fas"))
expect_true(are_fasta_filenames("1.fasta"))
expect_true(are_fasta_filenames("1.FAS"))
expect_true(are_fasta_filenames("1.FASTA"))
expect_true(are_fasta_filenames(c("1.fas", "2.fas")))

expect_false(are_fasta_filenames(""))
expect_false(are_fasta_filenames(NA))
expect_false(are_fasta_filenames(NULL))
expect_false(are_fasta_filenames(Inf))
expect_false(are_fasta_filenames("1.fasX"))

expect_false(are_fasta_filenames(c("1.fas", "2.exe")))
expect_false(are_fasta_filenames(c("1.bat", "2.exe")))
```

are_ids *Determine if x consists out of IDs*

Description

Determine if x consists out of IDs

Usage

```
are_ids(x)
```

Arguments

x	the object to check if it consists out of IDs

Value

TRUE if x, or all elements of x, are IDs

Author(s)

Richèl J.C. Bilderbeek

See Also

to check one ID, use is_id

are_init_clock_models *Determine if x consists out of initialized clock_models objects*

Description

Determine if x consists out of initialized clock_models objects

Usage

```
are_init_clock_models(x)
```

Arguments

x	the object to check if it consists out of initialized clock_models objects

Value

TRUE if x, or all elements of x, are initialized clock_model objects

Author(s)

Richèl J.C. Bilderbeek

are_init_mrca_priors *Determine if x consists out of initialized MRCA priors*

Description

Determine if x consists out of initialized MRCA priors

Usage

```
are_init_mrca_priors(x)
```

Arguments

x	the object to check if it consists out of initialized MRCA priors

Value

TRUE if x, or all elements of x, are initialized MRCA priors

Author(s)

Richèl J.C. Bilderbeek

are_init_site_models *Determine if x consists out of initialized site_models objects*

Description

Determine if x consists out of initialized site_models objects

Usage

```
are_init_site_models(x)
```

Arguments

x	the object to check if it consists out of initialized site_models objects

Value

TRUE if x, or all elements of x, are initialized site_model objects

Author(s)

Richèl J.C. Bilderbeek

are_init_tree_priors *Determine if x consists out of initialized tree_priors objects*

Description

Determine if x consists out of initialized tree_priors objects

Usage

```
are_init_tree_priors(x)
```

Arguments

x	the object to check if it consists out of initialized tree_priors objects

Value

TRUE if x, or all elements of x, are initialized tree_prior objects

Author(s)

Richèl J.C. Bilderbeek

are_mrca_align_ids_in_fasta *Determine if the MRCA priors' alignment IDs are present in the FASTA files*

Description

Determine if the MRCA priors' alignment IDs are present in the FASTA files

Usage

```
are_mrca_align_ids_in_fasta(mrca_prior, fasta_filename)
```

Arguments

mrca_prior	a Most Recent Common Ancestor prior, as returned by create_mrca_prior
fasta_filename	a FASTA filename. Use get_fasta_filename to obtain a testing FASTA filename.

Value

TRUE if all the MRCA priors' alignment IDs are present in the FASTA files. Returns FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

`are_mrca_priors` *Determine if x consists out of MRCA priors*

Description

Determine if x consists out of MRCA priors

Usage

```
are_mrca_priors(mrca_priors)
```

Arguments

`mrca_priors`	a list of one or more Most Recent Common Ancestor priors, as returned by `create_mrca_prior`

Value

TRUE if x, or all elements of x, are MRCA priors. Returns FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

`are_mrca_taxon_names_in_fasta` *Determine if the MRCA priors' taxa names are present in the FASTA files*

Description

Determine if the MRCA priors' taxa names are present in the FASTA files

Usage

```
are_mrca_taxon_names_in_fasta(mrca_prior, fasta_filename)
```

Arguments

`mrca_prior`	a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`
`fasta_filename`	a FASTA filename. Use `get_fasta_filename` to obtain a testing FASTA filename.

Value

TRUE if the MRCA priors' taxa names are present in the FASTA files. FALSE otherwise.

Author(s)

Richèl J.C. Bilderbeek

---

are_rln_clock_models *Are the clock models Relaxed Log-Normal clock models?*

Description

Are the clock models Relaxed Log-Normal clock models?

Usage

```
are_rln_clock_models(clock_models)
```

Arguments

clock_models	a list of one or more clock models, as returned by create_clock_model

Value

vector of booleans with the same length as the number of clock models in clock_models. Each nth element is TRUE if the nth element in clock_models is a relaxed log-normal clock model, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

---

are_site_models *Determine if x consists out of site_models objects*

Description

Determine if x consists out of site_models objects

Usage

```
are_site_models(x)
```

Arguments

x	the object to check if it consists out of site_models objects

Value

TRUE if x, or all elements of x, are site_model objects

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_site_model to create a site model

Examples

```
jc69_site_model <- create_jc69_site_model()
gtr_site_model <- create_gtr_site_model()
both_site_models <- list(jc69_site_model, gtr_site_model)
testit::assert(are_site_models(jc69_site_model))
testit::assert(are_site_models(gtr_site_model))
testit::assert(are_site_models(both_site_models))
```

---

are_tree_priors *Determine if x consists out of tree_priors objects*

Description

Determine if x consists out of tree_priors objects

Usage

```
are_tree_priors(x)
```

Arguments

x	the object to check if it consists out of tree_priors objects

Value

TRUE if x, or all elements of x, are tree_prior objects

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_yule_tree_prior to create a Yule tree prior

Examples

```
library(testthat)

yule_tree_prior <- create_yule_tree_prior()
bd_tree_prior <- create_bd_tree_prior()
both_tree_priors <- list(yule_tree_prior, bd_tree_prior)
expect_true(are_tree_priors(yule_tree_prior))
expect_true(are_tree_priors(bd_tree_prior))
expect_true(are_tree_priors(both_tree_priors))
```

`bd_tree_prior_to_xml_prior_distr` *Creates the tree prior section in the prior section of the prior section of the distribution section of a BEAST2 XML parameter file for a Birth-Death tree prior*

Description

Creates the tree prior section in the prior section of the prior section of the distribution section of a BEAST2 XML parameter file for a Birth-Death tree prior

Usage

```
bd_tree_prior_to_xml_prior_distr(bd_tree_prior)
```

Arguments

`bd_tree_prior`	a Birth-Death tree prior, as created by `create_bd_tree_prior`

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

beautier beautier*: A package to create a* BEAST2 *input file.*

Description

beautier allows to create a BEAST2 input file, using an R interface. beautier closely follows the interface of BEAUti 2, a GUI tool bundled with BEAST2, including its default settings.

Author(s)

Richèl J.C. Bilderbeek

See Also

These are packages associated with beautier:

- The package beastier can run BEAST2 from R
- The package tracerer can parse BEAST2 output files from R
- The package mauricer manages BEAST2 packages from R
- The package babette combines the functionality of beautier, beastier, mauricer and tracerer into a single workflow

Examples

```
# Get an example FASTA file
input_filename <- get_fasta_filename()

# The file created by beautier, a BEAST2 input file
output_filename <- tempfile()

# Use the default BEAUti settings to create a BEAST2 input file
create_beast2_input_file_from_model(
  input_filename,
  output_filename,
  inference_model = create_inference_model()
)
testthat::expect_true(file.exists(output_filename))
```

---

cbs_tree_prior_to_xml_prior_distr *Creates the tree prior section in the prior section of the prior section of the distribution section of a BEAST2 XML parameter file for a Birth-Death tree prior*

Description

Creates the tree prior section in the prior section of the prior section of the distribution section of a BEAST2 XML parameter file for a Birth-Death tree prior

Usage

```
cbs_tree_prior_to_xml_prior_distr(cbs_tree_prior)
```

Arguments

cbs_tree_prior	a Coalescent Bayesian Skyline tree prior, as returned by create_cbs_tree_prior

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

---

ccp_tree_prior_to_xml_prior_distr

Creates the tree prior section in the prior section of the prior section of the distribution section of a BEAST2 XML parameter file for a Coalescent Constant Population tree prior

---

Description

Creates the tree prior section in the prior section of the prior section of the distribution section of a BEAST2 XML parameter file for a Coalescent Constant Population tree prior

Usage

```
ccp_tree_prior_to_xml_prior_distr(ccp_tree_prior)
```

Arguments

ccp_tree_prior	a Coalescent Constant Population tree prior, as returned by create_ccp_tree_prior

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

`cep_tree_prior_to_xml_prior_distr`

Creates the tree prior section in the prior section of the prior section of the distribution section of a BEAST2 XML parameter file for a Coalescent Exponential Population tree prior

---

Description

Creates the tree prior section in the prior section of the prior section of the distribution section of a BEAST2 XML parameter file for a Coalescent Exponential Population tree prior

Usage

```
cep_tree_prior_to_xml_prior_distr(cep_tree_prior)
```

Arguments

`cep_tree_prior`	a Coalescent Exponential Population tree prior, as returned by `create_cep_tree_prior`

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

check_alignment_id *Check if the* alignment_id *is valid.*

Description

Will stop if not.

Usage

```
check_alignment_id(alignment_id)
```

Arguments

alignment_id	ID of the alignment, as returned by get_alignment_id. Keep at NA to have it initialized automatically

Examples

```
library(testthat)

# Path need not exist, use UNIX path as example
created <- get_alignment_id("/home/homer/anthus_aco_sub.fas")
expected <- "anthus_aco_sub"
expect_equal(created, expected)
expect_silent(check_alignment_id(created))
```

check_beauti_options *Check if the* beauti_options *is a valid* beauti_options *object.*

Description

Calls stop if the beauti_options object is invalid

Usage

```
check_beauti_options(beauti_options)
```

Arguments

beauti_options	one BEAUti options object, as returned by create_beauti_options

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_beauti_options to create a valid BEAUti options setup

Examples

```
testthat::expect_silent(check_beauti_options(create_beauti_options()))

# Must stop on nonsense
testthat::expect_error(check_beauti_options(beauti_options = "nonsense"))
testthat::expect_error(check_beauti_options(beauti_options = NULL))
testthat::expect_error(check_beauti_options(beauti_options = NA))
```

---

check_clock_model *Check if the clock model is a valid clock model.*

Description

Calls stop if the clock model is invalid

Usage

```
check_clock_model(clock_model)
```

Arguments

clock_model	a clock model, as returned by create_clock_model

Value

TRUE if clock_model is a valid clock model

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_clock_model to create a valid clock model

Examples

```
testthat::expect_silent(check_clock_model(create_strict_clock_model()))
testthat::expect_silent(check_clock_model(create_rln_clock_model()))

# Must stop on non-clock models
testthat::expect_error(check_clock_model(clock_model = "nonsense"))
testthat::expect_error(check_clock_model(clock_model = NULL))
testthat::expect_error(check_clock_model(clock_model = NA))
```

`check_clock_models` *Check if the object is a list of one or more clock models.*

Description

Will stop if the object is not a list of one or more clock models.

Usage

```
check_clock_models(clock_models)
```

Arguments

`clock_models`	the object to be checked if it is a list of one or more valid clock models

Value

nothing. Will stop if the object is not a list of one or more clock models.

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_clock_model to create a valid clock model

Examples

```
testthat::expect_silent(check_clock_models(create_strict_clock_model()))
testthat::expect_silent(
  check_clock_models(list(create_strict_clock_model()))
)
testthat::expect_silent(
  check_clock_models(
    list(create_strict_clock_model(), create_rln_clock_model())
  )
)

testthat::expect_error(check_clock_models("nonsense"))
```

```
  testthat::expect_error(check_clock_models(3.14))
  testthat::expect_error(check_clock_models(42))
  testthat::expect_error(check_clock_models(NA))
  testthat::expect_error(check_clock_models(NULL))
```

`check_file_and_model_agree` *Checks if the input FASTA file and the inference model agree.*

Description

Will stop if not

Usage

```
check_file_and_model_agree(input_filename, inference_model)
```

Arguments

`input_filename`	A FASTA filename. Use `get_fasta_filename` to obtain a testing FASTA filename.
`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

`check_file_exists` *Function to check if a file exists. Calls* `stop` *if the file is absent*

Description

Function to check if a file exists. Calls `stop` if the file is absent

Usage

```
check_file_exists(filename, filename_description = NA)
```

Arguments

`filename`	name of the file
`filename_description`	description of the filename

Value

nothing. Will `stop` if the file is absent, with a proper error message

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_silent(
  check_file_exists(
    get_beautier_path("anthus_aco_sub.fas")
  )
)

# Minimal use
expect_error(
  check_file_exists("absent"),
  "File not found. Could not find file with path 'absent'"
)

# Add a description

```

---

check_gamma_site_model

Checks if the parameter is a valid gamma site model

Description

Checks if the parameter is a valid gamma site model

Usage

```
check_gamma_site_model(gamma_site_model)
```

Arguments

`gamma_site_model`
: a site model's gamma site model, as returned by `create_gamma_site_model`

Value

nothing. Will call `stop` if the argument is not a valid gamma site model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_silent(
  check_gamma_site_model(
    create_gamma_site_model()
  )
)
expect_error(
  check_gamma_site_model(
    "not a gamma site model"
  )
)
```

---

check_gamma_site_model_names *Checks if the gamma site model has the right list elements' names*

Description

Checks if the gamma site model has the right list elements' names

Usage

```
check_gamma_site_model_names(gamma_site_model)
```

Arguments

gamma_site_model	a site model's gamma site model, as returned by create_gamma_site_model

Value

nothing. Will call stop if the argument is not a valid gamma site model

Author(s)

Richèl J.C. Bilderbeek

check_gtr_site_model *Check if the* gtr_site_model *is a valid GTR nucleotide substitution model.*

Description

Use create_gtr_site_model to create a valid GTR nucleotide substitution model.

Usage

```
check_gtr_site_model(gtr_site_model)
```

Arguments

gtr_site_model	a GTR site model, as returned by create_gtr_site_model

Examples

```
library(testthat)

expect_silent(check_gtr_site_model(create_gtr_site_model()))

expect_error(check_gtr_site_model("nonsense"))
expect_error(check_gtr_site_model(NA))
expect_error(check_gtr_site_model(NULL))
expect_error(check_gtr_site_model(""))
expect_error(check_gtr_site_model(c()))
```

check_gtr_site_model_names *Check if the* gtr_site_model *has the list elements of a valid* gtr_site_model *object.*

Description

Calls stop if an element is missing

Usage

```
check_gtr_site_model_names(gtr_site_model)
```

Arguments

gtr_site_model	a GTR site model, as returned by create_gtr_site_model

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_gtr_site_model to create a valid `gtr_site_model`

`check_inference_model` *Check if the supplied object is a valid Bayesian phylogenetic inference model.*

Description

Calls `stop` if the supplied object is not a valid Bayesian phylogenetic inference model.

Usage

```
check_inference_model(inference_model)
```

Arguments

`inference_model`
: a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_inference_model to create a valid Bayesian phylogenetic inference model

Examples

```
testthat::expect_silent(check_inference_model(create_inference_model()))

# Must stop on non-MCMCs
testthat::expect_error(check_inference_model(inference_model = "nonsense"))
testthat::expect_error(check_inference_model(inference_model = NULL))
testthat::expect_error(check_inference_model(inference_model = NA))
```

check_inference_models *Check if the* inference_model *is a valid BEAUti inference model.*

Description

Calls stop if not.

Usage

```
check_inference_models(inference_models)
```

Arguments

inference_models	a list of one or more inference models, as can be created by create_inference_model

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_inference_model to create a valid BEAST2 options object

Examples

```
testthat::expect_silent(
  check_inference_models(
      list(create_inference_model()
    )
  )
)

# Must stop on nonsense
testthat::expect_error(check_inference_models("nonsense"))
testthat::expect_error(check_inference_models(NULL))
testthat::expect_error(check_inference_models(NA))
```

check_is_monophyletic *Check if* is_monophyletic *has a valid value.*

Description

Will stop if not.

Usage

```
check_is_monophyletic(is_monophyletic)
```

Arguments

is_monophyletic	boolean to indicate monophyly is assumed in a Most Recent Common Ancestor prior, as returned by create_mrca_prior

check_log_mode *Check if the supplied* mode *is a valid logging mode.*

Description

Check if the supplied mode is a valid logging mode.

Usage

```
check_log_mode(mode)
```

Arguments

mode	mode how to log. Valid are tree, autodetect and compound

check_log_sort *Check if the supplied* sort *is a valid logging sorting option.*

Description

Check if the supplied sort is a valid logging sorting option.

Usage

```
check_log_sort(sort)
```

Arguments

sort	how to sort the entries in a log. Valid are smart, none and alphabetic

check_mcmc *Check if the MCMC is a valid MCMC object.*

Description

Calls stop if the MCMC is invalid

Usage

```
check_mcmc(mcmc)
```

Arguments

mcmc	one MCMC. Use create_mcmc to create an MCMC. Use create_ns_mcmc to create an MCMC for a Nested Sampling run. Use check_mcmc to check if an MCMC is valid. Use rename_mcmc_filenames to rename the filenames in an MCMC.

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_mcmc to create a valid MCMC

Examples

```
library(testthat)

expect_silent(check_mcmc(create_mcmc()))

 # Must stop on non-MCMCs
expect_error(check_mcmc(mcmc = "nonsense"))
expect_error(check_mcmc(mcmc = NULL))
expect_error(check_mcmc(mcmc = NA))
```

check_mcmc_list_element_names

Check if the MCMC has the list elements of a valid MCMC object.

Description

Calls `stop` if an element is missing

Usage

```
check_mcmc_list_element_names(mcmc)
```

Arguments

`mcmc`	one MCMC. Use `create_mcmc` to create an MCMC. Use `create_ns_mcmc` to create an MCMC for a Nested Sampling run. Use `check_mcmc` to check if an MCMC is valid. Use `rename_mcmc_filenames` to rename the filenames in an MCMC.

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use `create_mcmc` to create a valid MCMC

check_mcmc_values

Check if the MCMC has the list elements with valid values for being a valid MCMC object.

Description

Calls `stop` if a value is invalid

Usage

```
check_mcmc_values(mcmc)
```

Arguments

mcmc	one MCMC. Use create_mcmc to create an MCMC. Use create_ns_mcmc to create an MCMC for a Nested Sampling run. Use check_mcmc to check if an MCMC is valid. Use rename_mcmc_filenames to rename the filenames in an MCMC.

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_mcmc to create a valid MCMC

---

check_mrca_prior *Check if the MRCA prior is a valid MRCA prior.*

Description

Calls stop if the MRCA prior is invalid.

Usage

```
check_mrca_prior(mrca_prior)
```

Arguments

mrca_prior	a Most Recent Common Ancestor prior, as returned by create_mrca_prior

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_mrca_prior to create a valid MRCA prior

Examples

```
fasta_filename <- get_beautier_path("anthus_aco.fas")
mrca_prior <- create_mrca_prior(
  alignment_id = get_alignment_id(fasta_filename = fasta_filename),
  taxa_names = get_taxa_names(filename = fasta_filename)
)
mrca_prior <- create_mrca_prior(
 alignment_id = get_alignment_id(fasta_filename = fasta_filename),
 taxa_names = get_taxa_names(filename = fasta_filename)
)
testthat::expect_silent(check_mrca_prior(mrca_prior))

# NA is a valid MRCA prior
testthat::expect_silent(check_mrca_prior(mrca_prior = NA))

# Must stop on non-MRCA priors
testthat::expect_error(check_mrca_prior(mrca_prior = "nonsense"))
testthat::expect_error(check_mrca_prior(mrca_prior = NULL))
```

---

check_mrca_prior_name *Check if* mrca_prior_name *is a valid MRCA prior name.*

Description

A valid MRCA prior name is either NA or one character string. Will stop if not.

Usage

```
check_mrca_prior_name(mrca_prior_name)
```

Arguments

mrca_prior_name	the unique name of the MRCA prior, for example a genus, family, order or even class name. Leave at NA to have it named automatically.

---

check_mrca_prior_names *Check if the MRCA prior, which is a list, has all the named elements.*

Description

Calls stop if not.

Usage

```
check_mrca_prior_names(mrca_prior)
```

Arguments

mrca_prior	a Most Recent Common Ancestor prior, as returned by create_mrca_prior

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use check_mrca_prior to check the entire MRCA prior

---

check_mrca_prior_taxa_names

Check the MRCA prior's taxon names are valid.

Description

Will stop if not.

Usage

```
check_mrca_prior_taxa_names(taxa_names)
```

Arguments

taxa_names	names of the taxa, as returned by get_taxa_names. Keep at NA to have it initialized automatically, using all taxa in the alignment

---

check_ns_mcmc

Check if this an MCMC that uses Nested Sampling to estimate a marginal likelihood.

Description

Will stop if not, else will do nothing

Usage

```
check_ns_mcmc(mcmc)
```

Arguments

mcmc	one MCMC. Use create_mcmc to create an MCMC. Use create_ns_mcmc to create an MCMC for a Nested Sampling run. Use check_mcmc to check if an MCMC is valid. Use rename_mcmc_filenames to rename the filenames in an MCMC.

Author(s)

Richèl J.C. Bilderbeek

See Also

use create_ns_mcmc to create an MCMC that uses Nested Sampling to estimate a marginal likelihood

---

check_param *Check if the parameter is a valid parameter*

Description

Calls stop if the parameter is invalid

Usage

```
check_param(param)
```

Arguments

param	a parameter, as can be created by create_param.

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_param to create a valid parameter

Examples

```
library(testthat)

expect_silent(check_param(create_alpha_param()))
expect_silent(check_param(create_beta_param()))

# List of two parameters is not a/one parameter
expect_error(
   check_param(
     list(create_alpha_param(), create_beta_param())
   )
 )

# Must stop on non-parameters
expect_error(check_param("nonsense"))
expect_error(check_param(NULL))
expect_error(check_param(NA))
expect_error(check_param(""))
expect_error(check_param(c()))
```

---

check_param_names *Check if the* param *has the list elements of a valid* param *object.*

Description

Calls stop if an element is missing

Usage

```
check_param_names(param)
```

Arguments

param	a parameter, as can be created by create_param.

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_param to create a valid param

check_param_types — *Check if the* param *has the list elements of the right type for a valid* param *object.*

Description

Calls stop if an element has the incorrect type

Usage

```
check_param_types(param)
```

Arguments

param	a parameter, as can be created by create_param.

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_param to create a valid param

check_phylogeny — *Check if the phylogeny is a valid phylogeny object.*

Description

Calls stop if the phylogeny is invalid

Usage

```
check_phylogeny(phylogeny)
```

Arguments

phylogeny	a phylogeny of type phylo from the ape package

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use `ape::read.tree` to create a phylogeny

Examples

```
library(testthat)

# Must do nothing on phylogenies
phylogeny <- ape::read.tree(text = "(A:1, B:1):1;")
expect_silent(check_phylogeny(phylogeny))

# Must stop on non-phylogenies
expect_error(check_phylogeny("nonsense"))
expect_error(check_phylogeny(NULL))
expect_error(check_phylogeny(NA))
expect_error(check_phylogeny(c()))
expect_error(check_phylogeny(c(3, 1, 4)))
```

`check_rename_fun` *Check if the rename function is a valid filename rename function*

Description

Will stop if not

Usage

```
check_rename_fun(rename_fun)
```

Arguments

`rename_fun`	a function to rename a filename, as can be checked by check_rename_fun. This function should have one argument, which will be a filename or NA. The function should return one filename (when passed one filename) or one NA (when passed one NA). Example rename functions are: • get_remove_dir_fun get a function that removes the directory paths from the filenames, in effect turning these into local files • get_replace_dir_fun get a function that replaces the directory paths from the filenames • get_remove_hex_fun get a function that removes the hex string from filenames. For example, `tracelog_82c1a522040.log` becomes `tracelog.log`

Author(s)

Richèl J.C. Bilderbeek

check_rln_clock_model *Check if the clock model is a valid clock model.*

Description

Calls stop if the clock model is invalid

Usage

```
check_rln_clock_model(clock_model)
```

Arguments

clock_model	a clock model, as returned by create_clock_model

Value

TRUE if clock_model is a valid clock model

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_clock_model to create a valid clock model

Examples

```
testthat::expect_silent(
  check_rln_clock_model(create_rln_clock_model())
)
testthat::expect_error(
  check_rln_clock_model(create_strict_clock_model())
)
```

check_screenlog *Check if a* screenlog *is valid.*

Description

Will call stop if not.

Usage

```
check_screenlog(screenlog)
```

Arguments

screenlog	a screenlog, as created by create_screenlog

---

check_screenlog_names *Check if the* screenlog *has the list elements of a valid* screenlog *object.*

Description

Calls stop if an element is missing

Usage

```
check_screenlog_names(screenlog)
```

Arguments

screenlog	a screenlog, as created by create_screenlog

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_screenlog to create a valid screenlog

---

check_screenlog_values

Check if the screenlog has the list elements with valid values for being a valid screenlog object.

Description

Calls stop if a value is invalid

Usage

```
check_screenlog_values(screenlog)
```

Arguments

screenlog	a screenlog, as created by create_screenlog

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_screenlog to create a valid screenlog

---

check_site_model *Check if the site model is a valid site model*

Description

Calls stop if the site models are invalid

Usage

```
check_site_model(site_model)
```

Arguments

site_model	a site model, as returned by create_site_model

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_site_model to create a valid site model

Examples

```
library(testthat)

expect_silent(check_site_model(create_jc69_site_model()))
expect_silent(check_site_model(create_hky_site_model()))
expect_silent(check_site_model(create_tn93_site_model()))
expect_silent(check_site_model(create_gtr_site_model()))

# Can use list of one site model
expect_silent(check_site_model(list(create_jc69_site_model())))

# List of two site models is not a/one site model
expect_error(
   check_site_model(
     list(create_jc69_site_model(), create_jc69_site_model())
   )
 )

# Must stop on non-site models
expect_error(check_site_model("nonsense"))
expect_error(check_site_model(NULL))
expect_error(check_site_model(NA))
expect_error(check_site_model(""))
expect_error(check_site_model(c()))
```

`check_site_models` *Check if the object is a list of one or more site models.*

Description

Will stop if the object is not a list of one or more site models.

Usage

```
check_site_models(site_models)
```

Arguments

`site_models`	the object to be checked if it is a list of one or more valid site models

Value

nothing. Will stop if the object is not a list of one or more site models.

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_site_model to create a valid site model

Examples

```
testthat::expect_silent(check_site_models(create_jc69_site_model()))
testthat::expect_silent(check_site_models(list(create_jc69_site_model())))
testthat::expect_silent(
  check_site_models(
    list(create_jc69_site_model(), create_gtr_site_model())
  )
)

testthat::expect_error(check_site_models("nonsense"))
testthat::expect_error(check_site_models(3.14))
testthat::expect_error(check_site_models(42))
testthat::expect_error(check_site_models(NA))
testthat::expect_error(check_site_models(NULL))
```

---

check_site_model_names

Check if the site_model *has the list elements of a valid* site_model *object.*

Description

Calls stop if an element is missing

Usage

```
check_site_model_names(site_model)
```

Arguments

site_model	a site model, as returned by create_site_model

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_site_model to create a valid site_model

check_site_model_types

Check if the `site_model` *has the list elements of the right type for a valid* `site_model` *object.*

Description

Calls `stop` if an element has the incorrect type

Usage

```
check_site_model_types(site_model)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_site_model to create a valid `site_model`

check_store_every

Check if `store_every` *holds a valid value*

Description

Will stop if not

Usage

```
check_store_every(store_every)
```

Arguments

`store_every`	number of states the MCMC will process before the posterior's state will be saved to file. Use -1 or `NA` to use the default frequency.

check_strict_clock_model *Check if the clock model is a valid clock model.*

Description

Calls `stop` if the clock model is invalid

Usage

```
check_strict_clock_model(clock_model)
```

Arguments

`clock_model`	a clock model, as returned by `create_clock_model`

Value

TRUE if `clock_model` is a valid clock model

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_clock_model to create a valid clock model

Examples

```
testthat::expect_silent(
  check_strict_clock_model(create_strict_clock_model())
)
testthat::expect_error(
  check_strict_clock_model(create_rln_clock_model())
)
```

check_tn93_site_model *Check if the* tn93_site_model *is a valid TN93 nucleotide substitution model.*

Description

Use create_tn93_site_model to create a valid TN93 nucleotide substitution model.

Usage

```
check_tn93_site_model(tn93_site_model)
```

Arguments

tn93_site_model	a TN93 site model, as returned by create_tn93_site_model

Examples

```
library(testthat)

expect_silent(check_tn93_site_model(create_tn93_site_model()))

expect_error(check_tn93_site_model("nonsense"))
expect_error(check_tn93_site_model(NA))
expect_error(check_tn93_site_model(NULL))
expect_error(check_tn93_site_model(""))
expect_error(check_tn93_site_model(c()))
```

check_tn93_site_model_names *Check if the* tn93_site_model *has the list elements of a valid* tn93_site_model *object.*

Description

Calls stop if an element is missing

Usage

```
check_tn93_site_model_names(tn93_site_model)
```

Arguments

tn93_site_model	a TN93 site model, as returned by create_tn93_site_model

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_tn93_site_model to create a valid `tn93_site_model`

`check_tracelog` *Check if a* `tracelog` *is valid.*

Description

Will call stop if not.

Usage

```
check_tracelog(tracelog)
```

Arguments

`tracelog`	a `tracelog`, as created by create_tracelog

`check_tracelog_names` *Check if the* `tracelog` *has the list elements of a valid* `tracelog` *object.*

Description

Calls `stop` if an element is missing

Usage

```
check_tracelog_names(tracelog)
```

Arguments

`tracelog`	a `tracelog`, as created by create_tracelog

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_tracelog to create a valid `tracelog`

`check_tracelog_values` *Check if the tracelog has the list elements with valid values for being a valid tracelog object.*

Description

Calls `stop` if a value is invalid

Usage

```
check_tracelog_values(tracelog)
```

Arguments

`tracelog`	a `tracelog`, as created by create_tracelog

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_tracelog to create a valid tracelog

`check_treelog` *Check if a* `treelog` *is valid.*

Description

Will call stop if not.

Usage

```
check_treelog(treelog)
```

Arguments

`treelog`	a `treelog`, as created by create_treelog

check_treelog_names *Check if the* treelog *has the list elements of a valid* treelog *object.*

Description

Calls stop if an element is missing

Usage

```
check_treelog_names(treelog)
```

Arguments

treelog	a treelog, as created by create_treelog

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_treelog to create a valid treelog

check_treelog_values *Check if the treelog has the list elements with valid values for being a valid treelog object.*

Description

Calls stop if a value is invalid

Usage

```
check_treelog_values(treelog)
```

Arguments

treelog	a treelog, as created by create_treelog

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_treelog to create a valid treelog

`check_tree_prior` *Check if the tree prior is a valid tree prior*

Description

Calls `stop` if the tree priors are invalid

Usage

```
check_tree_prior(tree_prior)
```

Arguments

`tree_prior`	a tree priors, as returned by `create_tree_prior`

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_tree_prior to create a valid tree prior

Examples

```
testthat::expect_silent(check_tree_prior(create_yule_tree_prior()))
testthat::expect_silent(check_tree_prior(create_bd_tree_prior()))
testthat::expect_silent(check_tree_prior(create_cbs_tree_prior()))
testthat::expect_silent(check_tree_prior(create_ccp_tree_prior()))
testthat::expect_silent(check_tree_prior(create_cep_tree_prior()))

# Can use list of one tree prior
testthat::expect_silent(check_tree_prior(list(create_yule_tree_prior())))

# List of two tree priors is not a/one tree prior
testthat::expect_error(
  check_tree_prior(
    list(create_yule_tree_prior(), create_yule_tree_prior())
```

```
  )
)

# Must stop on non-tree priors
testthat::expect_error(check_tree_prior(tree_prior = "nonsense"))
testthat::expect_error(check_tree_prior(tree_prior = NULL))
testthat::expect_error(check_tree_prior(tree_prior = NA))
```

`check_tree_priors` *Check if the object is a list of one or more tree priors.*

Description

Will stop if the object is not a list of one or more tree priors.

Usage

```
check_tree_priors(tree_priors)
```

Arguments

`tree_priors`	the object to be checked if it is a list of one or more valid tree priors

Value

nothing. Will stop if the object is not a list of one or more tree priors.

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_tree_prior to create a valid tree prior

Examples

```
testthat::expect_silent(check_tree_priors(create_yule_tree_prior()))
testthat::expect_silent(check_tree_priors(list(create_yule_tree_prior())))
testthat::expect_silent(
  check_tree_priors(
    list(create_yule_tree_prior(), create_bd_tree_prior())
  )
)

testthat::expect_error(check_tree_priors("nonsense"))
testthat::expect_error(check_tree_priors(3.14))
testthat::expect_error(check_tree_priors(42))
testthat::expect_error(check_tree_priors(NA))
testthat::expect_error(check_tree_priors(NULL))
```

clock_models_to_xml_operators
Create all clock models' operators' XML text

Description

Create all clock models' operators' XML text

Usage

```
clock_models_to_xml_operators(
  clock_models,
  mrca_priors = NA,
  tipdates_filename = NA
)
```

Arguments

clock_models	a list of one or more clock models, as returned by create_clock_model
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior
tipdates_filename	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

clock_models_to_xml_prior_distr
Represent the clock models as XML

Description

Represent the clock models as XML

Usage

```
clock_models_to_xml_prior_distr(
  clock_models,
  mrca_priors = NA,
  tipdates_filename = NA
)
```

Arguments

clock_models	a list of one or more clock models, as returned by create_clock_model
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior
tipdates_filename	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

---

clock_models_to_xml_state

Converts one or more clock models to the state *section of the XML as text*

Description

Converts one or more clock models to the state section of the XML as text

Usage

```
clock_models_to_xml_state(
  inference_model,
  clock_models = "deprecated",
  mrca_priors = "deprecated",
  has_tip_dating = "deprecated"
)
```

Arguments

inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
clock_models	a list of one or more clock models, as returned by `create_clock_model`
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by `create_mrca_prior`
has_tip_dating	TRUE if the user has supplied tip dates, FALSE otherwise

Value

lines of XML text, without indentation nor `state` tags

Author(s)

Richèl J.C. Bilderbeek

---

clock_models_to_xml_state_check_deprecated

Internal function to check if clock_models_to_xml_state uses deprecated arguments.

Description

This internal function checks if clock_models_to_xml_state uses deprecated arguments. Will stop if this is the case

Usage

```
clock_models_to_xml_state_check_deprecated(
  clock_models,
  mrca_priors,
  has_tip_dating
)
```

Arguments

clock_models	a list of one or more clock models, as returned by create_clock_model
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior
has_tip_dating	TRUE if the user has supplied tip dates, FALSE otherwise

Value

Nothing

Author(s)

Richèl J.C. Bilderbeek

---

clock_models_to_xml_tracelog

Creates the clock models' XML for the tracelog section

Description

Creates the clock models' XML for the tracelog section

Usage

```
clock_models_to_xml_tracelog(clock_models, mrca_priors = NA)
```

Arguments

clock_models	a list of one or more clock models, as returned by create_clock_model
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

See Also

the complete tracelog section is created by create_tracelog_xml

Examples

```
# <logger id="tracelog" ...>
#'   # Here
# </logger>
```

`clock_model_to_xml_lh_distr` *Converts a clock model to the* `branchRateModel` *section of the XML as text.*

Description

This function will be called only if there are no MRCA priors.

Usage

```
clock_model_to_xml_lh_distr(
  inference_model,
  clock_model = "deprecated",
  mrca_priors = "deprecated",
  tipdates_filename = "deprecated"
)
```

Arguments

`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
`clock_model`	a clock model, as returned by `create_clock_model`
`mrca_priors`	a list of one or more Most Recent Common Ancestor priors, as returned by `create_mrca_prior`
`tipdates_filename`	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#     </distribution>
#     <distribution id="likelihood" ...>
#       HERE, where the ID of the distribution is 'likelihood'
#     </distribution>
# </distribution>
```

`clock_model_to_xml_operators` *Converts a clock model to the* `operators` *section of the XML as text*

Description

Converts a clock model to the `operators` section of the XML as text

Usage

```
clock_model_to_xml_operators(clock_model, mrca_priors, tipdates_filename = NA)
```

Arguments

`clock_model`	a clock model, as returned by `create_clock_model`
`mrca_priors`	a list of one or more Most Recent Common Ancestor priors, as returned by `create_mrca_prior`
`tipdates_filename`	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

clock_model_to_xml_prior_distr *Converts a clock model to the* prior *section of the XML as text*

Description

Converts a clock model to the prior section of the XML as text

Usage

```
clock_model_to_xml_prior_distr(
  clock_model,
  mrca_priors = NA,
  tipdates_filename = NA
)
```

Arguments

clock_model	a clock model, as returned by create_clock_model
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior
tipdates_filename	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

clock_model_to_xml_state

Converts a clock model to the `state` *section of the XML as text*

Description

Converts a clock model to the `state` section of the XML as text

Usage

```
clock_model_to_xml_state(clock_model, has_tip_dating = FALSE)
```

Arguments

`clock_model`	a clock model, as returned by `create_clock_model`
`has_tip_dating`	TRUE if the user has supplied tip dates, FALSE otherwise

Value

lines of XML text, without indentation nor `state` tags

Author(s)

Richèl J.C. Bilderbeek

clock_model_to_xml_tracelog

Creates the clock model's XML for the tracelog section

Description

Creates the clock model's XML for the tracelog section

Usage

```
clock_model_to_xml_tracelog(clock_model, mrca_priors = NA)
```

Arguments

`clock_model`	a clock model, as returned by `create_clock_model`
`mrca_priors`	a list of one or more Most Recent Common Ancestor priors, as returned by `create_mrca_prior`

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

See Also

all clock models' tracelog section is created by `clock_models_to_xml_tracelog`

Examples

```
# <logger id="tracelog" ...>
#'   # Here
# </logger>
```

---

clock_model_to_xml_treelogger

Convert a clock model to the XML of the `TreeLogger`

Description

Convert a clock model to the XML of the `TreeLogger`

Usage

```
clock_model_to_xml_treelogger(clock_model)
```

Arguments

`clock_model`	a clock model, as returned by `create_clock_model`

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

compare_lines *Internal debug function to compare the actually created lines to expected lines using any diff tool*

Description

Internal debug function to compare the actually created lines to expected lines using any diff tool

Usage

```
compare_lines(
  lines,
  expected,
  section = NA,
  created_lines_filename = "created.xml",
  expected_lines_filename = "expected.xml"
)
```

Arguments

lines	the created lines
expected	the expected/goal/target lines
section	the XML section. Leave at NA to compare all lines
created_lines_filename	name of the file where the (section of the) created lines are stored
expected_lines_filename	name of the file where the (section of the) expected lines are stored

Value

nothing. Instead, two files are created, with the names `created_lines_filename` and `expected_lines_filename` that contain the section under investigation, so that a diff tool can compare these

Author(s)

Richèl J.C. Bilderbeek

count_trailing_spaces *Count the number of spaces before the first character*

Description

Count the number of spaces before the first character

Usage

```
count_trailing_spaces(line)
```

Arguments

line	line of text

Value

the number of spaces before the first character

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_equal(count_trailing_spaces("x"), 0)
expect_equal(count_trailing_spaces(" y"), 1)
expect_equal(count_trailing_spaces("  <"), 2)
expect_equal(count_trailing_spaces(""), 0)
expect_equal(count_trailing_spaces(" "), 1)
expect_equal(count_trailing_spaces("  "), 2)
```

create_alpha_param *Create a parameter called alpha*

Description

Create a parameter called alpha

Usage

```
create_alpha_param(id = NA, value = 0)
```

Arguments

id	the parameter's ID
value	value of the parameter

Value

a parameter called alpha

Note

this parameter is used in a beta distribution (as returned by create_beta_distr) and gamma distribution (as returned by create_gamma_distr) and inverse-gamma distribution (as returned by create_inv_gamma_distr). It cannot be estimated (as a hyper parameter) yet.

Author(s)

Richèl J.C. Bilderbeek

See Also

the function create_param contains a list of all parameters that can be created

Examples

```
# Create the parameter
alpha_param <- create_alpha_param()

# Use the parameter in a distribution
beta_distr <- create_beta_distr(
  alpha = alpha_param
)

# Use the distribution to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = beta_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_bd_tree_prior` *Create a Birth-Death tree prior*

Description

Create a Birth-Death tree prior

Usage

```
create_bd_tree_prior(
  id = NA,
  birth_rate_distr = create_uniform_distr(),
  death_rate_distr = create_uniform_distr()
)
```

Arguments

`id`	the ID of the alignment
`birth_rate_distr`	the birth rate distribution, as created by a `create_distr` function
`death_rate_distr`	the death rate distribution, as created by a `create_distr` function

Value

a Birth-Death tree_prior

Author(s)

Richèl J.C. Bilderbeek

See Also

An alignment ID can be extracted from its FASTA filename using `get_alignment_id`

Examples

```
bd_tree_prior <- create_bd_tree_prior()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = bd_tree_prior
)
testit::assert(file.exists(beast2_input_file))

bd_tree_prior_exp <- create_bd_tree_prior(
```

```
  birth_rate_distr = create_exp_distr()
)

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = bd_tree_prior_exp
)
testit::assert(file.exists(beast2_input_file))
```

`create_beast2_beast_xml` *Create the* `<beast ...>` *XML*

Description

The `<beast ...>` XML is the XML at the start of a BEAST2 XML input file, directly after the general XML declaration (as created by create_xml_declaration).

Usage

```
create_beast2_beast_xml(beauti_options)
```

Arguments

`beauti_options`	one BEAUti options object, as returned by `create_beauti_options`

Value

the XML

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

beauti_options <- create_beauti_options_v2_6()
created <- create_beast2_beast_xml(
  beauti_options
)
expected <- paste0(
  "<beast ",
  "beautitemplate='Standard' ",
  "beautistatus='' ",
  "namespace=\"beast.core:beast.evolution.alignment:",
    "beast.evolution.tree.coalescent:beast.core.util:beast.evolution.nuc:",
```

```
    "beast.evolution.operators:beast.evolution.sitemodel:",
    "beast.evolution.substitutionmodel:beast.evolution.likelihood\" ",
  "required=\"\" ",
  "version=\"2.6\">"
)
expect_equal(created, expected)
```

`create_beast2_input` *Create a BEAST2 XML input text*

Description

Create a BEAST2 XML input text

Usage

```
create_beast2_input(
  input_filename,
  tipdates_filename = NA,
  site_model = create_jc69_site_model(),
  clock_model = create_strict_clock_model(),
  tree_prior = create_yule_tree_prior(),
  mrca_prior = NA,
  mcmc = create_mcmc(),
  beauti_options = create_beauti_options(),
  input_filenames = "deprecated",
  site_models = "deprecated",
  clock_models = "deprecated",
  tree_priors = "deprecated",
  mrca_priors = "deprecated",
  posterior_crown_age = "deprecated"
)
```

Arguments

`input_filename`	A FASTA filename. Use `get_fasta_filename` to obtain a testing FASTA filename.
`tipdates_filename`	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.
`site_model`	a site model, as returned by `create_site_model`
`clock_model`	a clock model, as returned by `create_clock_model`
`tree_prior`	a tree priors, as returned by `create_tree_prior`
`mrca_prior`	a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`

mcmc	one MCMC. Use create_mcmc to create an MCMC. Use create_ns_mcmc to create an MCMC for a Nested Sampling run. Use check_mcmc to check if an MCMC is valid. Use rename_mcmc_filenames to rename the filenames in an MCMC.
beauti_options	one BEAUti options object, as returned by create_beauti_options
input_filenames	One or more FASTA filenames. Use get_fasta_filename to obtain a testing FASTA filename.
site_models	one or more site models, as returned by create_site_model
clock_models	a list of one or more clock models, as returned by create_clock_model
tree_priors	one or more tree priors, as returned by create_tree_prior
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior
posterior_crown_age	deprecated

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_beast2_input_from_model to create the BEAST2 XML input text from an inference model Use create_beast2_input_file to also save it to file.

create_beast2_input_file shows more examples

Examples

```
text <- create_beast2_input(
  input_filename = get_fasta_filename()
)
testit::assert(substr(text[1], 1, 5) == "<?xml")
text[1]
testit::assert(tail(text, n = 1) == "</beast>")
```

`create_beast2_input_beast` *Creates the XML text for the* `beast` *tag of a BEAST2 parameter file.*

Description

Creates the XML text for the `beast` tag of a BEAST2 parameter file, which is directly after the XML declaration (created by create_xml_declaration.

Usage

```
create_beast2_input_beast(
  input_filename,
  inference_model = create_inference_model()
)
```

Arguments

`input_filename`	A FASTA filename. Use `get_fasta_filename` to obtain a testing FASTA filename.
`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Details

The `beast` tag has these elements:

```
<beast[...]>
    <data
    [...]
    </data>
    [map names]
    <run[...]>
    [...]
    </run>
</beast>
```

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_beast2_input_from_model to create the complete XML text. Use create_beast2_input_data to create the XML text for the data tag only. Use create_beast2_input_map to create the XML text for the [map names] part. Use create_beast2_input_run to create the XML text for the run tag only.

`create_beast2_input_data` *Creates the* `data` *section of a BEAST2 XML parameter file*

Description

Creates the data section of a BEAST2 XML parameter file

Usage

```
create_beast2_input_data(
  input_filename,
  beauti_options = create_beauti_options(),
  input_filenames = "deprecated"
)
```

Arguments

input_filename	A FASTA filename. Use get_fasta_filename to obtain a testing FASTA filename.
beauti_options	one BEAUti options object, as returned by create_beauti_options
input_filenames	One or more FASTA filenames. Use get_fasta_filename to obtain a testing FASTA filename.

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

create_beast2_input_data_sequences

Creates the data section of a BEAST2 XML parameter file

Description

Creates the data section of a BEAST2 XML parameter file

Usage

```
create_beast2_input_data_sequences(
  input_fasta_filename,
  beauti_options = create_beauti_options()
)
```

Arguments

input_fasta_filename	one FASTA filename
beauti_options	one BEAUti options object, as returned by create_beauti_options

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

create_beast2_input_distr

Creates the distribution section of a BEAST2 XML parameter file.

Description

Creates the distribution section of a BEAST2 XML parameter file.

Usage

```
create_beast2_input_distr(
  inference_model,
  site_models = "deprecated",
  clock_models = "deprecated",
  tree_priors = "deprecated",
  mrca_priors = "deprecated",
  tipdates_filename = "deprecated"
)
```

Arguments

inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
site_models	one or more site models, as returned by create_site_model
clock_models	a list of one or more clock models, as returned by create_clock_model
tree_priors	one or more tree priors, as returned by create_tree_prior
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior
tipdates_filename	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

lines of XML text

Note

this function is not intended for regular use, thus its long name length is accepted

Author(s)

Richèl J.C. Bilderbeek

See Also

create_beast2_input

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

create_beast2_input_distr_lh *Creates the XML text for the* distribution *tag with the* likelihood *ID, of a BEAST2 parameter file.*

Description

Creates the XML text for the distribution tag with the likelihood ID, of a BEAST2 parameter file, in an unindented form

Usage

```
create_beast2_input_distr_lh(
  inference_model,
  site_models = "deprecated",
  clock_models = "deprecated",
  mrca_priors = "deprecated",
  tipdates_filename = "deprecated"
)
```

Arguments

inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
site_models	one or more site models, as returned by create_site_model
clock_models	a list of one or more clock models, as returned by create_clock_model
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior
tipdates_filename	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Details

The distribution tag (with ID equals likelihood) has these elements:

```
<distribution id="likelihood"[...]>
   <distribution id="treeLikelihood"[...]>
     [...]
   </distribution>
</distribution>
```

The `distribution` section with ID `treeLikelihood` is created by create_tree_likelihood_distr_xml.

Zooming out:

```
<beast[...]>
  <run[...]>
    <distribution id="posterior"[...]>
      <distribution id="likelihood"[...]>
        [this section]
      </distribution>
    </distribution>
  </run>
</beast>
```

Note

this function is not intended for regular use, thus its long name length is accepted

this function is called by `create_beast2_input_distr`, together with `create_beast2_input_distr_prior`

`create_beast2_input_distr_prior` *Creates the prior section in the distribution section of a BEAST2 XML parameter file*

Description

Creates the prior section in the distribution section of a BEAST2 XML parameter file

Usage

```
create_beast2_input_distr_prior(
  inference_model,
  site_models = "deprecated",
  clock_models = "deprecated",
  tree_priors = "deprecated",
  mrca_priors = "deprecated",
  tipdates_filename = "deprecated"
)
```

Arguments

inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
site_models	one or more site models, as returned by create_site_model
clock_models	a list of one or more clock models, as returned by create_clock_model
tree_priors	one or more tree priors, as returned by create_tree_prior
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior
tipdates_filename	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Note

this function is not intended for regular use, thus its long name length is accepted

#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

---

create_beast2_input_file

Create a BEAST2 input file

Description

Create a BEAST2 input file

Usage

```
create_beast2_input_file(
  input_filename,
  output_filename,
  site_model = create_jc69_site_model(),
  clock_model = create_strict_clock_model(),
  tree_prior = create_yule_tree_prior(),
  mrca_prior = NA,
  mcmc = create_mcmc(),
  beauti_options = create_beauti_options(),
  tipdates_filename = NA,
  input_filenames = "deprecated",
  site_models = "deprecated",
  clock_models = "deprecated",
  tree_priors = "deprecated",
  mrca_priors = "deprecated",
  posterior_crown_age = "deprecated"
)
```

Arguments

input_filename	A FASTA filename. Use get_fasta_filename to obtain a testing FASTA filename.
output_filename	Name of the XML parameter file created by this function. BEAST2 uses this file as input.
site_model	a site model, as returned by create_site_model
clock_model	a clock model, as returned by create_clock_model
tree_prior	a tree priors, as returned by create_tree_prior
mrca_prior	a Most Recent Common Ancestor prior, as returned by create_mrca_prior
mcmc	one MCMC. Use create_mcmc to create an MCMC. Use create_ns_mcmc to create an MCMC for a Nested Sampling run. Use check_mcmc to check if an MCMC is valid. Use rename_mcmc_filenames to rename the filenames in an MCMC.
beauti_options	one BEAUti options object, as returned by create_beauti_options
tipdates_filename	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.
input_filenames	One or more FASTA filenames. Use get_fasta_filename to obtain a testing FASTA filename.
site_models	one or more site models, as returned by create_site_model
clock_models	a list of one or more clock models, as returned by create_clock_model
tree_priors	one or more tree priors, as returned by create_tree_prior

mrca_priors — a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior

posterior_crown_age — deprecated

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_beast2_input_file_from_model to do the same with an inference model. See create_site_model for examples with different site models. See create_clock_model for examples with clock models. See create_tree_prior for examples with different tree priors. See create_mcmc for examples with a different MCMC setup.

Examples

```
library(testthat)

# Get an example FASTA file
input_filename <- get_fasta_filename()

# The file created by beautier, a BEAST2 input file
output_filename <- tempfile(pattern = "beast2", fileext = ".xml")

create_beast2_input_file(
  input_filename,
  output_filename
)
expect_true(file.exists(output_filename))
```

---

create_beast2_input_file_from_model

Create a BEAST2 input file from an inference model

Description

Create a BEAST2 input file from an inference model

Usage

```
create_beast2_input_file_from_model(
  input_filename,
  output_filename,
  inference_model = create_inference_model()
)
```

Arguments

input_filename	A FASTA filename. Use get_fasta_filename to obtain a testing FASTA filename.
output_filename	Name of the XML parameter file created by this function. BEAST2 uses this file as input.
inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Value

nothing

Author(s)

Richèl J.C. Bilderbeek

See Also

use create_beast2_input_from_model to get the BEAST2 input file as text

See create_site_model for examples with different site models. See create_clock_model for examples with clock models. See create_tree_prior for examples with different tree priors. See create_mcmc for examples with a different MCMC setup. Use create_beast2_input_file to do the same with the elements of an inference model.

Examples

```
# Get an example FASTA file
input_filename <- get_fasta_filename()

# The file created by beautier, a BEAST2 input file
output_filename <- tempfile()

create_beast2_input_file_from_model(
  input_filename,
  output_filename
)
testthat::expect_true(file.exists(output_filename))
```

`create_beast2_input_from_model` *Create a BEAST2 XML input text from an inference model*

Description

The main two XML tags are these:

```
<?xml[...]?><beast[...]>
[...]
</beast>
```

Usage

```
create_beast2_input_from_model(input_filename, inference_model)
```

Arguments

`input_filename`	A FASTA filename. Use `get_fasta_filename` to obtain a testing FASTA filename.
`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_beast2_input_file_from_model to also save it to file. Use create_xml_declaration to create the XML text of the XML declaration. Use create_beast2_input_beast to create to create the XML text of the `beast` tag.

Examples

```
library(testthat)

text <- create_beast2_input_from_model(
  input_filename = get_fasta_filename(),
  inference_model = create_inference_model()
```

```
)
expect_true(substr(text[1], 1, 5) == "<?xml")
expect_true(tail(text, n = 1) == "</beast>")
```

`create_beast2_input_init` *Creates the* `init` *section of a BEAST2 XML parameter file*

Description

Creates the `init` section of a BEAST2 XML parameter file

Usage

```
create_beast2_input_init(
  inference_model,
  id = "deprecated",
  ids = "deprecated"
)
```

Arguments

`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
`id`	an alignment's IDs. An ID can be extracted from its FASTA filename with `get_alignment_ids_from_fasta_filenames`)
`ids`	one or more alignments' IDs. IDs can be extracted from their FASTA filenames with `get_alignment_ids_from_fasta_filenames`)

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

`create_beast2_input_map` *Creates the map section of a BEAST2 XML parameter file*

Description

Creates the map section of a BEAST2 XML parameter file

Usage

```
create_beast2_input_map(beauti_options)
```

Arguments

`beauti_options`	one BEAUti options object, as returned by `create_beauti_options`

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

`create_beast2_input_operators` *Creates the operators section of a BEAST2 XML parameter file*

Description

Creates the operators section of a BEAST2 XML parameter file

Usage

```
create_beast2_input_operators(
  site_models,
  clock_models,
  tree_priors,
  fixed_crown_ages = rep(FALSE, length(site_models)),
  mrca_priors = NA,
  tipdates_filename = NA
)
```

Arguments

site_models	one or more site models, as returned by create_site_model
clock_models	a list of one or more clock models, as returned by create_clock_model
tree_priors	one or more tree priors, as returned by create_tree_prior
fixed_crown_ages	one or more booleans to determine if the phylogenies' crown ages are fixed. If FALSE, crown age is estimated by BEAST2. If TRUE, the crown age is fixed to the crown age of the initial phylogeny.
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior
tipdates_filename	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

---

create_beast2_input_run

Creates the 'run' section of a BEAST2 XML parameter file

Description

Creates the 'run' section of a BEAST2 XML parameter file, without being indented.

Usage

```
create_beast2_input_run(
  input_filename,
  inference_model = create_inference_model()
)
```

Arguments

input_filename	A FASTA filename. Use get_fasta_filename to obtain a testing FASTA filename.
inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Details

The run tag has these elements:

```
<run[...]>
    <state[...]>
    [...]
    </state>
    <init[...]>
    [...]
    </init>
    <distribution[...]>
    [...]
    </distribution>
    [operator ids]
    [loggers]
 </run>
```

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_beast2_input_state to create the XML text of the state tag. Use create_beast2_input_init to create the XML text of the init tag. Use create_beast2_input_distr to create the XML text of the distribution tag. Use create_beast2_input_operators to create the XML text of the [operator ids] section. Use create_loggers_xml to create the XML text of the [loggers] part.

---

create_beast2_input_state

Creates the 'state' section of a BEAST2 XML parameter file

Description

Creates the 'state' section of a BEAST2 XML parameter file, without being indented.

Usage

```
create_beast2_input_state(
  inference_model,
  site_models = "deprecated",
  clock_models = "deprecated",
  tree_priors = "deprecated",
```

```
  mrca_priors = "deprecated",
  tipdates_filename = "deprecated"
)
```

Arguments

inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
site_models	one or more site models, as returned by `create_site_model`
clock_models	a list of one or more clock models, as returned by `create_clock_model`
tree_priors	one or more tree priors, as returned by `create_tree_prior`
mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by `create_mrca_prior`
tipdates_filename	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Details

The `state` tag has these elements:

```
<state[...]>
    <tree[...]>
    [...]
    </tree>
    [parameters]
 </run>
```

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_beast2_input_state to create the XML text of the `tree` tag. to create the XML text of the `[parameters]` section.

`create_beauti_options` *Function to create a set of BEAUti options.*

Description

BEAUti options are settings that differ between BEAUti version. The use of these options is mostly for testing older versions Whatever option chosen here, the created XML file will be valid.

Usage

```
create_beauti_options(
  capitalize_first_char_id = FALSE,
  nucleotides_uppercase = FALSE,
  beast2_version = "2.4",
  required = "",
  sequence_indent = 20
)
```

Arguments

`capitalize_first_char_id`	must the ID of alignment start with a capital? TRUE if yes, FALSE if it can be left lower case (if it is lowercase)
`nucleotides_uppercase`	must the nucleotides of the DNA sequence be in uppercase?
`beast2_version`	the BEAST2 version
`required`	things that may be required, for example `BEAST v2.5.0`
`sequence_indent`	the number of spaces the XML `sequence` lines are indented

Value

a BEAUti options structure

Author(s)

Richèl J.C. Bilderbeek

Examples

```
beauti_options <- create_beauti_options(
  nucleotides_uppercase = TRUE,
  beast2_version = "2.5"
)
xml <- create_beast2_input(
  get_fasta_filename(),
  beauti_options = beauti_options
```

```
)
testit::assert(is.character(xml))
testit::assert(length(xml) > 1)
```

`create_beauti_options_v2_4`
Function to create the BEAUti options for version 2.4.

Description

Function to create the BEAUti options for version 2.4, by calling create_beauti_options.

Usage

```
create_beauti_options_v2_4()
```

Value

a BEAUti options structure

Author(s)

Richèl J.C. Bilderbeek

Examples

```
beauti_options <- create_beauti_options_v2_4()
xml <- create_beast2_input(
  get_fasta_filename(),
  beauti_options = beauti_options
)

library(testthat)
expect_true(is.character(xml))
expect_true(length(xml) > 1)
```

`create_beauti_options_v2_6`
Function to create the BEAUti options for version 2.6.

Description

Function to create the BEAUti options for version 2.6, by calling create_beauti_options.

Usage

```
create_beauti_options_v2_6()
```

Value

a BEAUti options structure

Author(s)

Richèl J.C. Bilderbeek

Examples

```
beauti_options <- create_beauti_options_v2_6()
xml <- create_beast2_input(
  get_fasta_filename(),
  beauti_options = beauti_options
)

library(testthat)
expect_true(is.character(xml))
expect_true(length(xml) > 1)
```

---

create_beta_distr *Create a beta distribution*

Description

Create a beta distribution

Usage

```
create_beta_distr(id = NA, alpha = 0, beta = 1)
```

Arguments

id	the distribution's ID
alpha	the alpha shape parameter, a numeric value. The value of alpha must be at least 0.0. For advanced usage, use the structure as returned by create_alpha_param.
beta	the beta shape parameter, a numeric value. The value of beta must be at least 1.0. For advanced usage, use the structure as returned by create_beta_param.

Value

a beta distribution

Author(s)

Richèl J.C. Bilderbeek

See Also

the function create_distr shows an overview of all supported distributions

Examples

```
beta_distr <- create_beta_distr()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = beta_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_beta_param *Create a parameter called beta*

Description

Create a parameter called beta

Usage

```
create_beta_param(id = NA, value = 1)
```

Arguments

id	the parameter's ID
value	value of the parameter

Value

a parameter called beta

Note

this parameter is used in a beta distribution (as returned by create_beta_distr) and gamma distribution (as returned by create_gamma_distr) and inverse-gamma distribution (as returned by create_inv_gamma_distr). It cannot be estimated (as a hyper parameter) yet.

Author(s)

Richèl J.C. Bilderbeek

See Also

the function create_param contains a list of all parameters that can be created

Examples

```
# Create the parameter
beta_param <- create_beta_param()

# Use the parameter in a distribution
gamma_distr <- create_gamma_distr(
  beta = beta_param
)

# Use the distribution to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = gamma_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_branch_rate_model_rln_xml

Internal function to call create_branch_rate_model_xml for a relaxed log-normal clock.

Description

Internal function to call create_branch_rate_model_xml for a relaxed log-normal clock.

Usage

```
create_branch_rate_model_rln_xml(inference_model)
```

Arguments

`inference_model`

a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

`create_branch_rate_model_sc_xml` *Internal function to call create_branch_rate_model_xml for a strict clock.*

Description

Internal function to call create_branch_rate_model_xml for a strict clock.

Usage

```
create_branch_rate_model_sc_xml(inference_model)
```

Arguments

`inference_model` a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

`create_branch_rate_model_stuff_xml` *Internal function called by create_branch_rate_model_xml*

Description

It generates the desired XML for some circumstances. Yes, that is a vague description. Would be nice if someone would untangle this :-)

Usage

```
create_branch_rate_model_stuff_xml(inference_model)
```

Arguments

`inference_model`
: a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

`create_branch_rate_model_xml` *Internal function to create the* `branchRateModel` *section of the XML as text.*

Description

Creates the `branchRateModel` section of the XML as text.

Usage

```
create_branch_rate_model_xml(inference_model)
```

Arguments

`inference_model`
: a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Details

This function will be called only if there are no MRCA priors.

The `distribution` tag (with ID equals `treeLikelihood`) has these elements:

```
<branchRateModel[...]>
  [...]
</branchRateModel>
```

When there is a strict clock, create_branch_rate_model_sc_xml is called. When there is an RLN clock, create_branch_rate_model_rln_xml is called.

Zooming out:

```
<beast[...]>
  <run[...]>
    <distribution id="posterior"[...]>
      <distribution id="likelihood"[...]>
        <distribution id="treeLikelihood"[...]>
           [...]

           [this section]
        </distribution>
      </distribution>
    </distribution>
  </run>
</beast>
```

Value

a character vector of XML strings

Author(s)

Richèl J.C. Bilderbeek

`create_cbs_tree_prior` *Create a Coalescent Bayesian Skyline tree prior*

Description

Create a Coalescent Bayesian Skyline tree prior

Usage

```
create_cbs_tree_prior(id = NA, group_sizes_dimension = 5)
```

Arguments

`id`	an alignment's IDs. An ID can be extracted from its FASTA filename with `get_alignment_ids_from_fasta_filenames`)
`group_sizes_dimension`	the group sizes' dimension, as used by the CBS tree prior (see `create_cbs_tree_prior`)

Value

a Coalescent Bayesian Skyline tree_prior

Author(s)

Richèl J.C. Bilderbeek

See Also

An alignment ID can be extracted from its FASTA filename using `get_alignment_id`

Examples

```
cbs_tree_prior <- create_cbs_tree_prior()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_beautier_path("test_output_6.fas"),
  beast2_input_file,
  tree_prior = cbs_tree_prior
)
testit::assert(file.exists(beast2_input_file))
```

---

create_ccp_tree_prior *Create a Coalescent Constant Population tree prior*

Description

Create a Coalescent Constant Population tree prior

Usage

```
create_ccp_tree_prior(
  id = NA,
  pop_size_distr = beautier::create_one_div_x_distr()
)
```

Arguments

`id`	the ID of the alignment
`pop_size_distr`	the population distribution, as created by a `create_distr` function

Value

a Coalescent Constant Population tree_prior

Author(s)

Richèl J.C. Bilderbeek

See Also

An alignment ID can be extracted from its FASTA filename using `get_alignment_id`

Examples

```
ccp_tree_prior <- create_ccp_tree_prior()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = ccp_tree_prior
)
testit::assert(file.exists(beast2_input_file))
```

---

create_cep_tree_prior *Create a Coalescent Exponential Population tree prior*

Description

Create a Coalescent Exponential Population tree prior

Usage

```
create_cep_tree_prior(
  id = NA,
  pop_size_distr = create_one_div_x_distr(),
  growth_rate_distr = create_laplace_distr()
)
```

Arguments

id	the ID of the alignment
pop_size_distr	the population distribution, as created by a create_distr function
growth_rate_distr	the growth rate distribution, as created by a create_distr function

Value

a Coalescent Exponential Population tree_prior

Author(s)

Richèl J.C. Bilderbeek

See Also

An alignment ID can be extracted from its FASTA filename using get_alignment_id

Examples

```
cep_tree_prior <- create_cep_tree_prior()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = cep_tree_prior
)
testit::assert(file.exists(beast2_input_file))
```

---

create_clock_model *General function to create a clock model*

Description

General function to create a clock model

Usage

```
create_clock_model(name, id, ...)
```

Arguments

name	the clock model name. Valid names can be found in get_clock_model_names
id	a clock model's ID
...	specific clock model parameters

Value

a valid clock model

Note

Prefer using the named function create_rln_clock_model and create_strict_clock_model

Author(s)

Richèl J.C. Bilderbeek

See Also

An alignment ID can be extracted from its FASTA filename using get_alignment_id. For more examples about creating a relaxed log-normal clock model, see create_rln_clock_model. For more examples about creating a strict clock model, see create_strict_clock_model.

Examples

```
rln_clock_model <- create_rln_clock_model()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  get_fasta_filename(),
  beast2_input_file,
  clock_model = rln_clock_model
)
testit::assert(file.exists(beast2_input_file))

strict_clock_model <- create_strict_clock_model()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  get_fasta_filename(),
  beast2_input_file,
  clock_model = strict_clock_model
)
testit::assert(file.exists(beast2_input_file))
```

---

create_clock_models *Creates all supported clock models, which is a list of the types returned by* create_rln_clock_model*, and* create_strict_clock_model

---

Description

Creates all supported clock models, which is a list of the types returned by create_rln_clock_model, and create_strict_clock_model

Usage

```
create_clock_models()
```

Value

a list of site_models

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_clock_model to create a clock model

Examples

```
library(testthat)

clock_models <- create_clock_models()
expect_true(is_rln_clock_model(clock_models[[1]]))
expect_true(is_strict_clock_model(clock_models[[2]]))
```

`create_clock_models_from_names` *Create clock models from their names*

Description

Create clock models from their names

Usage

```
create_clock_models_from_names(clock_model_names)
```

Arguments

`clock_model_names`	one or more names of a clock model, must be name among those returned by `get_clock_model_names`

Value

a list of one or more clock models

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_clock_models to get all clock models

Examples

```
names <- get_clock_model_names()
clock_models <- create_clock_models_from_names(names)

for (i in seq_along(names)) {
  testthat::expect_equal(names[i], clock_models[[i]]$name)
}
```

`create_clock_model_from_name` *Create a clock model from name*

Description

Create a clock model from name

Usage

```
create_clock_model_from_name(clock_model_name)
```

Arguments

`clock_model_name`	name of a clock model, must be a name as returned by `get_clock_model_names`

Value

a clock model, as can be created by create_clock_model

Author(s)

Richèl J.C. Bilderbeek

See Also

Use `create_clock_model` to create a clock model

Examples

```
clock_model_names <- get_clock_model_names()
for (clock_model_name in clock_model_names) {
  clock_model <- create_clock_model_from_name(clock_model_name)
  testthat::expect_equal(clock_model_name, clock_model$name)
}
```

create_clock_rate_param *Create a parameter called* clock_rate*, as needed by* create_strict_clock_model

Description

Create a parameter called clock_rate, as needed by create_strict_clock_model

Usage

```
create_clock_rate_param(value = "1.0", id = NA)
```

Arguments

value	value of the parameter
id	the parameter's ID

Value

a parameter called rate

Note

It cannot be estimated (as a hyper parameter) yet.

Author(s)

Richèl J.C. Bilderbeek

See Also

the function create_param contains a list of all parameters that can be created

Examples

```
clock_rate_param <- create_clock_rate_param(
  id = "anthus_aco", value = 1.0
)

# Use the parameter in a clock model
strict_clock_model <- create_strict_clock_model(
  clock_rate_param = clock_rate_param
)

# Use the distribution to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
```

```
  beast2_input_file,
  clock_model = strict_clock_model
)
testit::assert(file.exists(beast2_input_file))
```

`create_data_xml` *Create the* `<data ..>` *XML*

Description

Create the `<data ..>` XML

Usage

```
create_data_xml(id, beast2_version)
```

Arguments

`id`	an alignment's IDs. An ID can be extracted from its FASTA filename with `get_alignment_ids_from_fasta_filenames`)
`beast2_version`	BEAST2 version, for example, code"2.5"

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

`create_distr` *General function to create a distribution.*

Description

General function to create a distribution.

Usage

```
create_distr(name, id, ...)
```

Arguments

`name`	the distribution name. Valid names can be found in `get_distr_names`
`id`	the distribution's ID
`...`	specific distribution parameters

Value

a distribution

Note

Prefer using the named functions create_beta_distr, create_exp_distr, create_gamma_distr, create_inv_gamma_distr, create_laplace_distr, create_log_normal_distr, create_normal_distr, create_one_div_x_distr, create_poisson_distr and create_uniform_distr

See create_beta_distr, create_exp_distr, create_gamma_distr, create_inv_gamma_distr, create_laplace_distr, create_log_normal_distr, create_normal_distr, create_one_div_x_distr, create_poisson_distr and create_uniform_distr for examples how to use those distributions

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# Use any distribution
distr <- create_beta_distr()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_exp_distr *Create an exponential distribution*

Description

Create an exponential distribution

Usage

```
create_exp_distr(id = NA, mean = 1)
```

Arguments

id	the distribution's ID
mean	the mean parameter, a numeric value. For advanced usage, use the structure as returned by create_mean_param

Value

an exponential distribution

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_distr` shows an overview of all supported distributions

Examples

```
exp_distr <- create_exp_distr()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = exp_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_gamma_distr` *Create a gamma distribution*

Description

Create a gamma distribution

Usage

```
create_gamma_distr(id = NA, alpha = 0.5396, beta = 0.3819)
```

Arguments

`id`	the distribution's ID
`alpha`	the alpha shape parameter, a numeric value. For advanced usage, use the structure as returned by `create_alpha_param`
`beta`	the beta shape parameter, a numeric value. For advanced usage, use the structure as returned by `create_beta_param`

Value

a gamma distribution

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_distr` shows an overview of all supported distributions

Examples

```
gamma_distr <- create_gamma_distr(
   alpha = 0.05,
   beta = 10.0
)

gtr_site_model <- create_gtr_site_model(
  rate_ac_prior_distr = gamma_distr
)

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  site_model = gtr_site_model
)
testit::assert(file.exists(beast2_input_file))
```

---

create_gamma_site_model

Create a gamma site model, part of a site model

Description

Create a gamma site model, part of a site model

Usage

```
create_gamma_site_model(
  gamma_cat_count = "0",
  gamma_shape = "1.0",
  prop_invariant = "0.0",
  gamma_shape_prior_distr = NA,
  freq_equilibrium = "estimated"
)
```

Arguments

gamma_cat_count	the number of gamma categories, must be an integer with value zero or more
gamma_shape	gamma curve shape parameter
prop_invariant	the proportion invariant, must be a value from 0.0 to 1.0
gamma_shape_prior_distr	the distribution of the gamma shape prior. gamma_shape_prior_distr must be NA for a gamma_cat_count of zero or one. For a gamma_cat_count of two or more, leaving gamma_shape_prior_distr equal to its default value of NA, a default distribution is used. Else gamma_shape_prior_distr must be a distribution, as can be created by create_distr
freq_equilibrium	the frequency in which the rates are at equilibrium are either estimated, empirical or all_equal. get_freq_equilibrium_names returns the possible values for freq_equilibrium

Value

a gamma site model

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_gamma_site_model to create a gamma site model

Examples

```
gamma_site_model <- create_gamma_site_model(prop_invariant = 0.5)

site_model <- create_hky_site_model(gamma_site_model = gamma_site_model)

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  get_fasta_filename(),
  beast2_input_file,
  site_model = site_model
)
testit::assert(file.exists(beast2_input_file))
```

`create_gtr_site_model` *Create a GTR site model*

Description

Create a GTR site model

Usage

```
create_gtr_site_model(
  id = NA,
  gamma_site_model = create_gamma_site_model(),
 rate_ac_prior_distr = create_gamma_distr(alpha = 0.05, beta = create_beta_param(value
    = "10.0")),
 rate_ag_prior_distr = create_gamma_distr(alpha = 0.05, beta = create_beta_param(value
    = "20.0")),
 rate_at_prior_distr = create_gamma_distr(alpha = 0.05, beta = create_beta_param(value
    = "10.0")),
 rate_cg_prior_distr = create_gamma_distr(alpha = 0.05, beta = create_beta_param(value
    = "10.0")),
 rate_gt_prior_distr = create_gamma_distr(alpha = 0.05, beta = create_beta_param(value
    = "10.0")),
  rate_ac_param = create_rate_ac_param(),
  rate_ag_param = create_rate_ag_param(),
  rate_at_param = create_rate_at_param(),
  rate_cg_param = create_rate_cg_param(),
  rate_ct_param = create_rate_ct_param(),
  rate_gt_param = create_rate_gt_param(),
  freq_equilibrium = "estimated"
)
```

Arguments

`id`	the IDs of the alignment (can be extracted from the FASTA filename using `get_alignment_id`)
`gamma_site_model`	a gamma site model, as created by `create_gamma_site_model`
`rate_ac_prior_distr`	the AC rate prior distribution, as returned by `create_distr`
`rate_ag_prior_distr`	the AG rate prior distribution, as returned by `create_distr`
`rate_at_prior_distr`	the AT rate prior distribution, as returned by `create_distr`
`rate_cg_prior_distr`	the CG rate prior distribution, as returned by `create_distr`

`rate_gt_prior_distr`
: the GT rate prior distribution, as returned by `create_distr`

`rate_ac_param`
: the 'rate AC' parameter, a numeric value. For advanced usage, use the structure as returned by `create_rate_ac_param`

`rate_ag_param`
: the 'rate AG' parameter, a numeric value. For advanced usage, use the structure as returned by `create_rate_ag_param`

`rate_at_param`
: the 'rate AT' parameter, a numeric value. For advanced usage, use the structure as returned by `create_rate_at_param`

`rate_cg_param`
: the 'rate CG' parameter, a numeric value. For advanced usage, use the structure as returned by `create_rate_cg_param`

`rate_ct_param`
: the 'rate CT' parameter, a numeric value. For advanced usage, use the structure as returned by `create_rate_ct_param`

`rate_gt_param`
: the 'rate GT' parameter, a numeric value. For advanced usage, use the structure as returned by `create_rate_gt_param`

`freq_equilibrium`
: the frequency in which the rates are at equilibrium are either `estimated`, `empirical` or `all_equal`. `get_freq_equilibrium_names` returns the possible values for `freq_equilibrium`

Value

a GTR site_model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
gtr_site_model <- create_gtr_site_model(
  rate_ac_param = 1.2,
  rate_ag_param = 2.3,
  rate_at_param = 3.4,
  rate_cg_param = 4.5,
  rate_ct_param = 5.6,
  rate_gt_param = 6.7
)

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  site_model = gtr_site_model
)
testit::assert(file.exists(beast2_input_file))
```

create_gtr_subst_model_xml *Converts a GTR site model to XML, used in the* substModel *section*

Description

Converts a GTR site model to XML, used in the substModel section

Usage

```
create_gtr_subst_model_xml(site_model)
```

Arguments

site_model	a site model, as returned by create_site_model

Value

the site model as XML text

Author(s)

Richèl J.C. Bilderbeek

create_hky_site_model *Create an HKY site model*

Description

Create an HKY site model

Usage

```
create_hky_site_model(
  id = NA,
  kappa = "2.0",
  gamma_site_model = create_gamma_site_model(),
 kappa_prior_distr = create_log_normal_distr(m = create_m_param(value = "1.0"), s =
    1.25),
  freq_equilibrium = "estimated"
)
```

Arguments

id	the IDs of the alignment (can be extracted from the FASTA filename using get_alignment_id)
kappa	the kappa
gamma_site_model	a gamma site model, as created by create_gamma_site_model
kappa_prior_distr	the distribution of the kappa prior, which is a log-normal distribution (as created by create_log_normal_distr) by default
freq_equilibrium	the frequency in which the rates are at equilibrium are either estimated, empirical or all_equal. get_freq_equilibrium_names returns the possible values for freq_equilibrium

Value

an HKY site_model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
hky_site_model <- create_hky_site_model()

create_beast2_input_file(
  input_filename = get_fasta_filename(),
  output_filename = tempfile(pattern = "beast", fileext = ".xml"),
  site_model = hky_site_model
)
```

---

create_hky_subst_model_xml

Converts a site model to XML, used in the substModel *section*

Description

Converts a site model to XML, used in the substModel section

Usage

```
create_hky_subst_model_xml(site_model)
```

Arguments

site_model	a site model, as returned by create_site_model

Value

the site model as XML text

Author(s)

Richèl J.C. Bilderbeek

`create_inference_model` *Create a Bayesian phylogenetic inference model.*

Description

Create a Bayesian phylogenetic inference model, as can be done by BEAUti.

Usage

```
create_inference_model(
  site_model = create_jc69_site_model(),
  clock_model = create_strict_clock_model(),
  tree_prior = create_yule_tree_prior(),
  mrca_prior = NA,
  mcmc = create_mcmc(),
  beauti_options = create_beauti_options(),
  tipdates_filename = NA
)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`
`clock_model`	a clock model, as returned by `create_clock_model`
`tree_prior`	a tree priors, as returned by `create_tree_prior`
`mrca_prior`	a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`
`mcmc`	one MCMC. Use `create_mcmc` to create an MCMC. Use `create_ns_mcmc` to create an MCMC for a Nested Sampling run. Use `check_mcmc` to check if an MCMC is valid. Use `rename_mcmc_filenames` to rename the filenames in an MCMC.
`beauti_options`	one BEAUti options object, as returned by `create_beauti_options`
`tipdates_filename`	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

an inference model

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_inference_model to create an inference model

Examples

```
# Create an MCMC chain with 50 states
inference_model <- create_inference_model(
  mcmc = create_mcmc(chain_length = 50000, store_every = 1000)
)

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file_from_model(
  get_fasta_filename(),
  beast2_input_file,
  inference_model = inference_model
)
testit::assert(file.exists(beast2_input_file))
```

---

create_inv_gamma_distr

Create an inverse-gamma distribution

Description

Create an inverse-gamma distribution

Usage

```
create_inv_gamma_distr(id = NA, alpha = 0, beta = 1)
```

Arguments

id	the distribution's ID
alpha	the alpha shape parameter, a numeric value. For advanced usage, use the structure as returned by create_alpha_param
beta	the beta shape parameter, a numeric value. For advanced usage, use the structure as returned by create_beta_param

Value

an inverse-gamma distribution

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_distr` shows an overview of all supported distributions

Examples

```
inv_gamma_distr <- create_inv_gamma_distr()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = inv_gamma_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_jc69_site_model

Create a JC69 site model

Description

Create a JC69 site model

Usage

```
create_jc69_site_model(id = NA, gamma_site_model = create_gamma_site_model())
```

Arguments

`id`	the IDs of the alignment (can be extracted from the FASTA filename using `get_alignment_id`)
`gamma_site_model`	a gamma site model, as created by `create_gamma_site_model`

Value

a JC69 site_model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
jc69_site_model <- create_jc69_site_model()

create_beast2_input_file(
  input_filename = get_fasta_filename(),
  output_filename = tempfile(pattern = "beast", fileext = ".xml"),
  site_model = jc69_site_model
)
```

---

create_jc69_subst_model_xml *Converts a JC69 site model to XML, used in the* substModel *section*

Description

Converts a JC69 site model to XML, used in the substModel section

Usage

```
create_jc69_subst_model_xml(site_model)
```

Arguments

site_model	a site model, as returned by create_site_model

Value

the site model as XML text

Author(s)

Richèl J.C. Bilderbeek

---

create_kappa_1_param *Create a parameter called kappa 1*

Description

Create a parameter called kappa 1

Usage

```
create_kappa_1_param(id = NA, lower = "0.0", value = "2.0", estimate = TRUE)
```

Arguments

id	the parameter's ID
lower	lowest possible value of the parameter. If the parameter is estimated, lower must be less than value
value	value of the parameter
estimate	TRUE if this parameter is to be estimated by BEAST2, FALSE otherwise

Value

a parameter called kappa 1

Author(s)

Richèl J.C. Bilderbeek

---

create_kappa_2_param *Create a parameter called kappa 2*

Description

Create a parameter called kappa 2

Usage

```
create_kappa_2_param(id = NA, lower = "0.0", value = "2.0", estimate = TRUE)
```

Arguments

id	the parameter's ID
lower	lowest possible value of the parameter. If the parameter is estimated, lower must be less than value
value	value of the parameter
estimate	TRUE if this parameter is to be estimated by BEAST2, FALSE otherwise

Value

a parameter called kappa 2

Author(s)

Richèl J.C. Bilderbeek

`create_lambda_param` *Create a parameter called lambda*

Description

Create a parameter called lambda

Usage

```
create_lambda_param(id = NA, value = 0)
```

Arguments

`id`	the parameter's ID
`value`	value of the parameter

Value

a parameter called lambda

Note

this parameter is used in a Poisson distribution (as returned by `create_poisson_distr`)

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_param` contains a list of all parameters that can be created

Examples

```
# Create the parameter
lambda_param <- create_lambda_param()

# Use the parameter in a distribution
poisson_distr <- create_poisson_distr(
  lambda = lambda_param
)

# Use the distribution to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = poisson_distr
```

```
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_laplace_distr` *Create a Laplace distribution*

Description

Create a Laplace distribution

Usage

```
create_laplace_distr(id = NA, mu = 0, scale = 1)
```

Arguments

`id`	the distribution's ID
`mu`	the mu parameter, a numeric value. For advanced usage, use the structure as returned by `create_mu_param`
`scale`	the scale parameter, a numeric value. For advanced usage, use the structure as returned by `create_scale_param`

Value

a Laplace distribution

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_distr` shows an overview of all supported distributions

Examples

```
laplace_distr <- create_laplace_distr()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = laplace_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_loggers_xml` *Creates the three logger sections of a BEAST2 XML parameter file*

Description

The logger section has these elements:

```
<logger id="tracelog" [...]>
    [...]
</logger>
<logger id="screenlog" [...]>
    [...]
</logger>
<logger id="treelog.t:[alignment ID]"  [...]>
    [...]
</logger>
```

Usage

```
create_loggers_xml(input_filename, inference_model)
```

Arguments

`input_filename`	A FASTA filename. Use `get_fasta_filename` to obtain a testing FASTA filename.
`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_tracelog_xml to create the XML text of the logger with the `tracelog` ID. Use create_screenlog_xml to create the XML text of the logger with the `screenlog` ID. Use create_treelog_xml to create the XML text of the loggers with the `treelog` ID.

`create_log_normal_distr` *Create a log-normal distribution*

Description

Create a log-normal distribution

Usage

```
create_log_normal_distr(id = NA, m = 0, s = 0)
```

Arguments

`id`	the distribution's ID
`m`	the m parameter, a numeric value. For advanced usage, use the structure as returned by `create_m_param`
`s`	the s parameter, a numeric value. For advanced usage, use the structure as returned by `create_s_param`

Value

a log-normal distribution

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_distr` shows an overview of all supported distributions

Examples

```
log_normal_distr <- create_log_normal_distr()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = log_normal_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_mcmc` *Create an MCMC configuration.*

Description

Create an MCMC configuration, as in the BEAUti MCMC tab. The number of states that will be saved equals the chain length (`chain_length`) divided by the number of states between each sampling event (`store_every`)

Usage

```
create_mcmc(
  chain_length = 1e+07,
  store_every = -1,
  pre_burnin = 0,
  n_init_attempts = 10,
  sample_from_prior = FALSE,
  tracelog = create_tracelog(),
  screenlog = create_screenlog(),
  treelog = create_treelog()
)
```

Arguments

`chain_length`	length of the MCMC chain
`store_every`	number of states the MCMC will process before the posterior's state will be saved to file. Use -1 or `NA` to use the default frequency.
`pre_burnin`	number of burn in samples taken before entering the main loop
`n_init_attempts`	number of initialization attempts before failing
`sample_from_prior`	set to TRUE to sample from the prior
`tracelog`	a `tracelog`, as created by create_tracelog
`screenlog`	a `screenlog`, as created by create_screenlog
`treelog`	a `treelog`, as created by create_treelog

Value

an MCMC configuration

Author(s)

Richèl J.C. Bilderbeek

See Also

Use `create_ns_mcmc` to create an MCMC for a Nested Sampling run. Use `check_mcmc` to check if an MCMC is valid. Use `rename_mcmc_filenames` to rename the filenames in an MCMC.

Examples

```
library(testthat)

# Create an MCMC chain with 50 states
mcmc <- create_mcmc(chain_length = 50000, store_every = 1000)

beast2_input_file <- tempfile()
create_beast2_input_file(
  get_fasta_filename(),
  beast2_input_file,
  mcmc = mcmc
)
expect_true(file.exists(beast2_input_file))
```

---

create_mean_param *Create a parameter called mean*

Description

Create a parameter called mean

Usage

```
create_mean_param(id = NA, value = 0)
```

Arguments

id	the parameter's ID
value	value of the parameter

Value

a parameter called mean

Note

this parameter is used in an exponential distribution (as returned by `create_exp_distr`) and normal distribution (as returned by `create_normal_distr`). It cannot be estimated (as a hyper parameter) yet.

Author(s)

Richèl J.C. Bilderbeek

See Also

the function create_param contains a list of all parameters that can be created

Examples

```
# Create the parameter
mean_param <- create_mean_param(value = 1.0)

# Use the parameter in a distribution
exp_distr <- create_exp_distr(
  mean = mean_param
)

# Use the distribution to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = exp_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_mrca_prior *Create a Most Recent Common Ancestor prior*

Description

Create a Most Recent Common Ancestor prior

Usage

```
create_mrca_prior(
  alignment_id = NA,
  taxa_names = NA,
  is_monophyletic = FALSE,
  mrca_distr = NA,
  name = NA,
  clock_prior_distr_id = NA
)
```

Arguments

alignment_id	ID of the alignment, as returned by get_alignment_id. Keep at NA to have it initialized automatically
taxa_names	names of the taxa, as returned by get_taxa_names. Keep at NA to have it initialized automatically, using all taxa in the alignment

is_monophyletic
: boolean to indicate monophyly is assumed in a Most Recent Common Ancestor prior, as returned by create_mrca_prior

mrca_distr
: the distribution used by the MRCA prior. Can be NA (the default) or any distribution returned by create_distr

name
: the unique name of the MRCA prior, for example a genus, family, order or even class name. Leave at NA to have it named automatically.

clock_prior_distr_id
: ID of an MRCA clock model's distribution. Keep at NA to have it initialized automatically

Value

an MRCA prior

Author(s)

Richèl J.C. Bilderbeek

Examples

```
fasta_filename <- get_beautier_path("anthus_aco.fas")

# The first two taxa are sister species
mrca_prior <- create_mrca_prior(
  alignment_id = get_alignment_id(fasta_filename = fasta_filename),
  taxa_names = get_taxa_names(filename = fasta_filename)[1:2]
)

# Set the crown age
mrca_prior <- create_mrca_prior(
  alignment_id = get_alignment_id(fasta_filename = fasta_filename),
  taxa_names = get_taxa_names(filename = fasta_filename),
  is_monophyletic = TRUE
)
```

---

create_mu_param *Create a parameter called mu*

Description

Create a parameter called mu

Usage

```
create_mu_param(id = NA, value = 0)
```

Arguments

id	the parameter's ID
value	value of the parameter

Value

a parameter called mu

Note

this parameter is used in a Laplace distribution (as returned by create_laplace_distr). It cannot be estimated (as a hyper parameter) yet.

Author(s)

Richèl J.C. Bilderbeek

See Also

the function create_param contains a list of all parameters that can be created

Examples

```
# Create the parameter
mu_param <- create_mu_param()

# Use the parameter in a distribution
laplace_distr <- create_laplace_distr(
  mu = mu_param
)

# Use the distribution to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = laplace_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_m_param` *Create a parameter called m*

Description

Create a parameter called m

Usage

```
create_m_param(id = NA, value = 0)
```

Arguments

`id`	the parameter's ID
`value`	value of the parameter

Value

a parameter called m

Note

this parameter is used in a log-normal distribution (as returned by `create_log_normal_distr`) It cannot be estimated (as a hyper parameter) yet.

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_param` contains a list of all parameters that can be created

Examples

```
# Create the parameter
m_param <- create_m_param()

# Use the parameter in a distribution
log_normal_distr <- create_log_normal_distr(
  m = m_param
)

# Use the distribution to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
```

```
    birth_rate_distr = log_normal_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_normal_distr` *Create an normal distribution*

Description

Create an normal distribution

Usage

```
create_normal_distr(id = NA, mean = 0, sigma = 1)
```

Arguments

`id`	the distribution's ID
`mean`	the mean parameter, a numeric value. For advanced usage, use the structure as returned by `create_mean_param`
`sigma`	the sigma parameter, a numeric value. For advanced usage, use the structure as returned by `create_sigma_param`

Value

a normal distribution

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_distr` shows an overview of all supported distributions

Examples

```
normal_distr <- create_normal_distr()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = normal_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_ns_mcmc` *Create an MCMC object to estimate the marginal likelihood using Nested Sampling.*

Description

This will result in a BEAST run that estimates the marginal likelihood until convergence is achieved. In this context, `chain_length` is only an upper bound to the length of that run.

Usage

```
create_ns_mcmc(
  chain_length = 1e+07,
  store_every = -1,
  pre_burnin = 0,
  n_init_attempts = 3,
  particle_count = 1,
  sub_chain_length = 5000,
  epsilon = "1e-12",
  tracelog = create_tracelog(),
  screenlog = create_screenlog(),
  treelog = create_treelog()
)
```

Arguments

`chain_length`	upper bound to the length of the MCMC chain
`store_every`	number of states the MCMC will process before the posterior's state will be saved to file. Use -1 or `NA` to use the default frequency.
`pre_burnin`	number of burn in samples taken before entering the main loop
`n_init_attempts`	number of initialization attempts before failing
`particle_count`	number of particles
`sub_chain_length`	sub-chain length
`epsilon`	epsilon
`tracelog`	a `tracelog`, as created by create_tracelog
`screenlog`	a `screenlog`, as created by create_screenlog
`treelog`	a `treelog`, as created by create_treelog

Value

an MCMC object

Author(s)

Richèl J.C. Bilderbeek

See Also

Use `create_mcmc` to create a regular MCMC. Use `create_test_ns_mcmc` to create an NS MCMC for testing, with, among others, a short MCMC chain length. Use `check_ns_mcmc` to check that an NS MCMC object is valid.

Examples

```
mcmc <- create_ns_mcmc(
  chain_length = 1e7,
  store_every = 1000,
  particle_count = 1,
  sub_chain_length = 1000,
  epsilon = 1e-12
)

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  get_fasta_filename(),
  beast2_input_file,
  mcmc = mcmc
)
testit::assert(file.exists(beast2_input_file))
```

---

create_one_div_x_distr

Create a 1/x distribution

Description

Create a 1/x distribution

Usage

```
create_one_div_x_distr(id = NA)
```

Arguments

`id`	the distribution's ID

Value

a 1/x distribution

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_distr` shows an overview of all supported distributions

Examples

```
one_div_x_distr <- create_one_div_x_distr()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = one_div_x_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_param *General function to create a parameter.*

Description

General function to create a parameter.

Usage

```
create_param(name, id, value, ...)
```

Arguments

`name`	the parameters' name. Valid names can be found in `get_param_names`
`id`	the parameter's ID
`value`	value of the parameter
`...`	specific parameter parameters

Value

a parameter

Note

Prefer using the named functions create_alpha_param, create_beta_param, create_clock_rate_param, create_kappa_1_param, create_kappa_2_param, create_lambda_param, create_m_param, create_mean_param, create_mu_param, create_rate_ac_param, create_rate_ag_param, create_rate_at_param, create_rate_cg_param, create_rate_ct_param, create_rate_gt_param, create_s_param, create_scale_param, and create_sigma_param

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# Create an alpha parameter
alpha_param <- create_alpha_param()

# Use the parameter in a distribution
beta_distr <- create_beta_distr(
  alpha = alpha_param
)

# Use the distribution to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = beta_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_poisson_distr *Create a Poisson distribution*

Description

Create a Poisson distribution

Usage

```
create_poisson_distr(id = NA, lambda = 0)
```

Arguments

id	the distribution's ID
lambda	the lambda parameter, a numeric value. For advanced usage, use the structure as returned by create_lambda_param

Value

a Poisson distribution

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_distr` shows an overview of all supported distributions

Examples

```
poisson_distr <- create_poisson_distr()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = poisson_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_rate_ac_param *Create a parameter called 'rate AC'*

Description

Create a parameter called 'rate AC'

Usage

```
create_rate_ac_param(id = NA, estimate = TRUE, value = "1.0", lower = "0.0")
```

Arguments

`id`	the parameter's ID
`estimate`	TRUE if this parameter is to be estimated by BEAST2, FALSE otherwise
`value`	value of the parameter
`lower`	lowest possible value of the parameter. If the parameter is estimated, `lower` must be less than `value`

Value

a parameter called 'rate AC'

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_param` contains a list of all parameters that can be created

Examples

```
# Create parameter
rate_ac_param <- create_rate_ac_param(value = 1, estimate = FALSE)

# Use the parameter to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  site_model = create_gtr_site_model(
    rate_ac_param = rate_ac_param
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_rate_ag_param *Create a parameter called 'rate AG'*

Description

Create a parameter called 'rate AG'

Usage

```
create_rate_ag_param(id = NA, estimate = TRUE, value = "1.0", lower = "0.0")
```

Arguments

`id`	the parameter's ID
`estimate`	TRUE if this parameter is to be estimated by BEAST2, FALSE otherwise
`value`	value of the parameter
`lower`	lowest possible value of the parameter. If the parameter is estimated, `lower` must be less than `value`

Value

a parameter called 'rate AG'

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_param` contains a list of all parameters that can be created

Examples

```
# Create parameter
rate_ag_param <- create_rate_ag_param(value = 1, estimate = FALSE)

# Use the parameter to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  site_model = create_gtr_site_model(
    rate_ag_param = rate_ag_param
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_rate_at_param` *Create a parameter called 'rate AT'*

Description

Create a parameter called 'rate AT'

Usage

```
create_rate_at_param(id = NA, estimate = TRUE, value = "1.0", lower = "0.0")
```

Arguments

`id`	the parameter's ID
`estimate`	TRUE if this parameter is to be estimated by BEAST2, FALSE otherwise
`value`	value of the parameter
`lower`	lowest possible value of the parameter. If the parameter is estimated, `lower` must be less than `value`

Value

a parameter called 'rate AT'

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_param` contains a list of all parameters that can be created

Examples

```
# Create parameter
rate_at_param <- create_rate_at_param(value = 1, estimate = FALSE)

# Use the parameter to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  site_model = create_gtr_site_model(
    rate_at_param = rate_at_param
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_rate_cg_param *Create a parameter called 'rate CG'*

Description

Create a parameter called 'rate CG'

Usage

```
create_rate_cg_param(id = NA, estimate = TRUE, value = "1.0", lower = "0.0")
```

Arguments

`id`	the parameter's ID
`estimate`	TRUE if this parameter is to be estimated by BEAST2, FALSE otherwise
`value`	value of the parameter
`lower`	lowest possible value of the parameter. If the parameter is estimated, `lower` must be less than `value`

Value

a parameter called 'rate CG'

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_param` contains a list of all parameters that can be created

Examples

```
# Create parameter
rate_cg_param <- create_rate_cg_param(value = 1, estimate = FALSE)

# Use the parameter to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  site_model = create_gtr_site_model(
    rate_cg_param = rate_cg_param
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_rate_ct_param` *Create a parameter called 'rate CT'*

Description

Create a parameter called 'rate CT'

Usage

```
create_rate_ct_param(id = NA, value = "1.0", lower = "0.0")
```

Arguments

`id`	the parameter's ID
`value`	value of the parameter
`lower`	lowest possible value of the parameter. If the parameter is estimated, `lower` must be less than `value`

Value

a parameter called 'rate CT'

Author(s)

Richèl J.C. Bilderbeek

See Also

the function create_param contains a list of all parameters that can be created

Examples

```
# Create parameter
rate_ct_param <- create_rate_ct_param(value = 1)

# Use the parameter to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  site_model = create_gtr_site_model(
    rate_ct_param = rate_ct_param
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_rate_gt_param *Create a parameter called 'rate GT'*

Description

Create a parameter called 'rate GT'

Usage

```
create_rate_gt_param(id = NA, estimate = TRUE, value = "1.0", lower = "0.0")
```

Arguments

id	the parameter's ID
estimate	TRUE if this parameter is to be estimated by BEAST2, FALSE otherwise
value	value of the parameter
lower	lowest possible value of the parameter. If the parameter is estimated, lower must be less than value

Value

a parameter called 'rate GT'

Author(s)

Richèl J.C. Bilderbeek

See Also

the function create_param contains a list of all parameters that can be created

Examples

```
# Create parameter
rate_gt_param <- create_rate_gt_param(value = 1, estimate = FALSE)

# Use the parameter to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  site_model = create_gtr_site_model(
    rate_gt_param = rate_gt_param
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_rln_clock_model

Create a relaxed log-normal clock model

Description

Create a relaxed log-normal clock model

Usage

```
create_rln_clock_model(
  id = NA,
  mean_rate_prior_distr = create_uniform_distr(),
  ucldstdev_distr = create_gamma_distr(),
  mparam_id = NA,
  mean_clock_rate = "1.0",
  n_rate_categories = -1,
  normalize_mean_clock_rate = FALSE,
  dimension = NA
)
```

Arguments

id	an alignment's IDs. An ID can be extracted from its FASTA filename with get_alignment_ids_from_fasta_filenames)
mean_rate_prior_distr	the mean clock rate prior distribution, as created by a create_distr function

ucldstdev_distr
: the standard deviation of the uncorrelated log-normal distribution, as created by a `create_distr` function

mparam_id
: the ID of the M parameter in the `branchRateModel`, set to NA to have it initialized

mean_clock_rate
: the mean clock rate, 1.0 by default (is called `ucld_stdev` in XML, where `ucld_stdev` is always 0.1)

n_rate_categories
: the number of rate categories. -1 is default, 0 denotes as much rates as branches

normalize_mean_clock_rate
: normalize the mean clock rate

dimension
: the dimensionality of the relaxed clock model. Leave NA to let beautier calculate it. Else, the dimensionality of the clock equals twice the number of taxa minus two.

Value

a relaxed log-normal clock_model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
rln_clock_model <- create_rln_clock_model()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  get_fasta_filename(),
  beast2_input_file,
  clock_model = rln_clock_model
)
testit::assert(file.exists(beast2_input_file))

rln_clock_model_exp <- create_rln_clock_model(
  mean_rate_prior_distr = create_exp_distr()
)

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  get_fasta_filename(),
  beast2_input_file,
  clock_model = rln_clock_model_exp
)
testit::assert(file.exists(beast2_input_file))
```

`create_scale_param` *Create a parameter called scale*

Description

Create a parameter called scale

Usage

```
create_scale_param(id = NA, value = 0)
```

Arguments

`id`	the parameter's ID
`value`	value of the parameter

Value

a parameter called scale

Note

this parameter is used in a Laplace distribution (as returned by `create_laplace_distr`)

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_param` contains a list of all parameters that can be created

Examples

```
# Create the parameter
scale_param <- create_scale_param()

# Use the parameter in a distribution
laplace_distr <- create_laplace_distr(
  scale = scale_param
)

# Use the distribution to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = laplace_distr
```

```
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_screenlog` *Create a* `screenlog` *object*

Description

Create a `screenlog` object

Usage

```
create_screenlog(
  filename = "",
  log_every = 1000,
  mode = "autodetect",
  sanitise_headers = FALSE,
  sort = "none"
)
```

Arguments

`filename`	name of the file to store the posterior screens phylogenies to. By default, this is `$(screen).screens`
`log_every`	number of MCMC states between writing to file
`mode`	mode how to log. Valid values are the ones returned by get_log_modes
`sanitise_headers`	set to TRUE to sanitise the headers of the log file
`sort`	how to sort the log. Valid values are the ones returned by get_log_sorts

---

`create_screenlog_xml` *Creates the* `screenlog` *section of the* `logger` *section of a BEAST2 XML parameter file*

Description

Creates the `screenlog` section of the `logger` section of a BEAST2 XML parameter file

Usage

```
create_screenlog_xml(inference_model = create_inference_model())
```

Arguments

`inference_model`
: a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Value

the XML text

Author(s)

Richèl J.C. Bilderbeek

`create_sigma_param` *Create a parameter called sigma*

Description

Create a parameter called sigma

Usage

```
create_sigma_param(id = NA, value = 1)
```

Arguments

`id`	the parameter's ID
`value`	value of the parameter

Value

a parameter called sigma

Note

this parameter is used in a normal distribution (as returned by `create_normal_distr`)

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_param` contains a list of all parameters that can be created

Examples

```
# Create the parameter
sigma_param <- create_sigma_param()

# Use the parameter in a distribution
normal_distr <- create_normal_distr(
  sigma = sigma_param
)

# Use the distribution to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = normal_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

---

create_site_model *General function to create a site model.*

Description

General function to create a site model.

Usage

```
create_site_model(name, id, gamma_site_model = create_gamma_site_model(), ...)
```

Arguments

name	the site model name. Valid names can be found in get_site_model_names
id	the IDs of the alignment (can be extracted from the FASTA filename using get_alignment_id)
gamma_site_model	a gamma site model, as created by create_gamma_site_model
...	specific site model parameters

Value

a site_model

Note

Prefer using the named functions create_gtr_site_model, create_hky_site_model,, create_jc69_site_model, and create_tn93_site_model

Author(s)

Richèl J.C. Bilderbeek

See Also

See create_gtr_site_model for more examples with a GTR site model. See create_hky_site_model for more examples with an HKY site model. See create_jc69_site_model for more examples with a JC69 site model. See create_tn93_site_model for more examples with a TN93 site model

Examples

```
library(testthat)

input_filename <- get_fasta_filename()

# GTR
output_filename <- tempfile(pattern = "example_gtr", fileext = ".xml")
create_beast2_input_file(
  input_filename = input_filename,
  output_filename = output_filename,
  site_model = create_gtr_site_model()
)
expect_true(file.exists(output_filename))

# HKY
output_filename <- tempfile(pattern = "example_hky", fileext = ".xml")
create_beast2_input_file(
  input_filename = input_filename,
  output_filename = output_filename,
  site_model = create_hky_site_model()
)
expect_true(file.exists(output_filename))

# JC69
output_filename <- tempfile(pattern = "example_jc69", fileext = ".xml")
create_beast2_input_file(
  input_filename = input_filename,
  output_filename = output_filename,
  site_model = create_jc69_site_model()
)
expect_true(file.exists(output_filename))

# TN93
output_filename <- tempfile(pattern = "example_tn93", fileext = ".xml")
create_beast2_input_file(
  input_filename = input_filename,
  output_filename = output_filename,
  site_model = create_tn93_site_model()
)
expect_true(file.exists(output_filename))
```

create_site_models	*Creates all supported site models which is a list of the types returned by* create_gtr_site_model, create_hky_site_model, create_jc69_site_model *and* create_tn93_site_model

Description

Creates all supported site models which is a list of the types returned by create_gtr_site_model, create_hky_site_model, create_jc69_site_model and create_tn93_site_model

Usage

```
create_site_models()
```

Value

a list of site_models

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_site_model to create a site model

Examples

```
library(testthat)

# All created site models are a kind of site model
site_models <- create_site_models()
expect_true(is_gtr_site_model(site_models[[1]]))
expect_true(is_hky_site_model(site_models[[2]]))
expect_true(is_jc69_site_model(site_models[[3]]))
expect_true(is_tn93_site_model(site_models[[4]]))

# Names are conformant
for (site_model in site_models) {
  expect_true(site_model$name %in% get_site_model_names())
}
```

`create_site_models_from_names` *Create site models from their names*

Description

Create site models from their names

Usage

```
create_site_models_from_names(site_model_names)
```

Arguments

`site_model_names`	one or more names of a site model, must be name among those returned by `get_site_model_names`

Value

one or more site models

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_site_model to create a site model

Examples

```
names <- get_site_model_names()
site_models <- create_site_models_from_names(names)

for (i in seq_along(names)) {
  testthat::expect_equal(names[i], site_models[[i]]$name)
}
```

`create_site_model_from_name` *Create a site model from name*

Description

Create a site model from name

Usage

```
create_site_model_from_name(site_model_name)
```

Arguments

`site_model_name`	name of a site model, must be a name as returned by `get_site_model_names`

Value

a site model

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_site_model to create a site model

Examples

```
site_model_names <- get_site_model_names()
for (site_model_name in site_model_names) {
  site_model <- create_site_model_from_name(site_model_name)
  testthat::expect_equal(site_model_name, site_model$name)
}
```

`create_site_model_parameters_xml` *Internal function to creates the XML text for the* `parameters` *within the* `siteModel` *section of a BEAST2 parameter file.*

Description

Internal function to creates the XML text for the `parameters` within the `siteModel` section, which is part of the `siteModel` section of a BEAST2 parameter file.

Usage

```
create_site_model_parameters_xml(inference_model)
```

Arguments

`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Details

The `parameters` sections has these elements:

```
[parameters]
```

`[parameters]` can be a combination of these:

```
<parameter id="mutationRate.s[...]>
<parameter id="gammaShape.s[...]>
<parameter id="proportionInvariant.s[...]>
```

Value

the site model as XML text

Author(s)

Richèl J.C. Bilderbeek

`create_site_model_xml` *Internal function to creates the XML text for the* `siteModel` *tag of a BEAST2 parameter file.*

Description

Creates the XML text for the `siteModel` tag of a BEAST2 parameter file, which is part of the `distribution` node for the `treeLikelihood` ID.

Usage

```
create_site_model_xml(inference_model)
```

Arguments

`inference_model`
: a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Details

The `siteModel` tag has these elements:

```
<siteModel[...]>

    [parameters]

    <substModel[...]>
      [...]
    </substModel>
</siteModel>
```

The `parameter` section is created by create_site_model_parameters_xml The `substModel` section is created by create_subst_model_xml

Value

the site model as XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior"[...]">
#     <distribution id="likelihood" [...]>
#       <siteModel...>
#         [parameters]
#       </siteModel>
#     </distribution>
# </distribution>
```

`create_strict_clock_model` *Create a strict clock model*

Description

Create a strict clock model

Usage

```
create_strict_clock_model(
  id = NA,
  clock_rate_param = create_clock_rate_param(),
  clock_rate_distr = create_uniform_distr()
)
```

Arguments

`id`	an alignment's IDs. An ID can be extracted from its FASTA filename with `get_alignment_ids_from_fasta_filenames`)
`clock_rate_param`	the clock rate's parameter, a numeric value. For advanced usage, use the structure as created by the `create_clock_rate_param` function
`clock_rate_distr`	the clock rate's distribution, as created by a `create_distr` function

Value

a strict clock_model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
strict_clock_model <- create_strict_clock_model(
  clock_rate_param = 1.0,
  clock_rate_distr = create_uniform_distr()
)

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  get_fasta_filename(),
  beast2_input_file,
  clock_model = strict_clock_model
)
testit::assert(file.exists(beast2_input_file))

strict_clock_model_gamma <- create_strict_clock_model(
  clock_rate_distr = create_gamma_distr()
)

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  get_fasta_filename(),
  beast2_input_file,
  clock_model = strict_clock_model_gamma
)
testit::assert(file.exists(beast2_input_file))
```

---

create_subst_model_xml

Internal function to create the `substModel` *section*

Description

Internal function to create the `substModel` section

Usage

```
create_subst_model_xml(inference_model)
```

Arguments

`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Value

the `substModel` section as XML text

Author(s)

Richèl J.C. Bilderbeek

`create_s_param` *Create a parameter called s*

Description

Create a parameter called s

Usage

```
create_s_param(id = NA, value = 0, lower = 0, upper = Inf)
```

Arguments

`id`	the parameter's ID
`value`	value of the parameter
`lower`	lowest possible value of the parameter. If the parameter is estimated, `lower` must be less than `value`
`upper`	upper value of the parameter

Value

a parameter called s

Note

this parameter is used in a log-normal distribution (as returned by `create_log_normal_distr`)

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_param` contains a list of all parameters that can be created

Examples

```
# Create the parameter
s_param <- create_s_param()

# Use the parameter in a distribution
log_normal_distr <- create_log_normal_distr(
  s = s_param
)
```

```
# Use the distribution to create a BEAST2 input file
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = log_normal_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

`create_temp_screenlog_filename` *Create a filename for a temporary screenlog file*

Description

Create a filename for a temporary screenlog file

Usage

```
create_temp_screenlog_filename()
```

See Also

use create_screenlog to create a screenlog.

`create_temp_tracelog_filename` *Create a filename for a temporary tracelog file*

Description

Create a filename for a temporary tracelog file

Usage

```
create_temp_tracelog_filename()
```

See Also

use create_tracelog to create a tracelog.

`create_temp_treelog_filename`
Create a filename for a temporary treelog file

Description

Create a filename for a temporary treelog file

Usage

```
create_temp_treelog_filename()
```

See Also

use create_treelog to create a treelog.

`create_test_inference_model`
Create a simple inference model with a short MCMC chain

Description

Create a simple inference model with a short MCMC chain

Usage

```
create_test_inference_model(
  site_model = create_jc69_site_model(),
  clock_model = create_strict_clock_model(),
  tree_prior = create_yule_tree_prior(),
  mrca_prior = NA,
  mcmc = create_test_mcmc(),
  beauti_options = create_beauti_options(),
  tipdates_filename = NA
)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`
`clock_model`	a clock model, as returned by `create_clock_model`
`tree_prior`	a tree priors, as returned by `create_tree_prior`
`mrca_prior`	a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`

mcmc one MCMC. Use create_mcmc to create an MCMC. Use create_ns_mcmc to create an MCMC for a Nested Sampling run. Use check_mcmc to check if an MCMC is valid. Use rename_mcmc_filenames to rename the filenames in an MCMC.

beauti_options one BEAUti options object, as returned by create_beauti_options

tipdates_filename
name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

an inference model

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_inference_model to create the BEAST2 default inference model

Examples

```
library(testthat)

inference_model <- create_test_inference_model()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file_from_model(
  get_fasta_filename(),
  beast2_input_file,
  inference_model = inference_model
)
expect_true(file.exists(beast2_input_file))
```

---

create_test_mcmc *Create an MCMC configuration for testing.*

Description

Create an MCMC configuration for testing.

Usage

```
create_test_mcmc(
  chain_length = 3000,
  store_every = 1000,
  pre_burnin = 0,
  n_init_attempts = 10,
  sample_from_prior = FALSE,
  tracelog = create_test_tracelog(),
  screenlog = create_test_screenlog(),
  treelog = create_test_treelog()
)
```

Arguments

chain_length	length of the MCMC chain
store_every	number of states the MCMC will process before the posterior's state will be saved to file. Use -1 or NA to use the default frequency.
pre_burnin	number of burn in samples taken before entering the main loop
n_init_attempts	number of initialization attempts before failing
sample_from_prior	set to TRUE to sample from the prior
tracelog	a tracelog, as created by create_tracelog
screenlog	a screenlog, as created by create_screenlog
treelog	a treelog, as created by create_treelog

Value

an MCMC configuration

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_mcmc to create a default BEAST2 MCMC

Examples

```
library(testthat)

# Create an MCMC chain with 50 states
mcmc <- create_test_mcmc()

 beast2_input_file <- tempfile(fileext = ".xml")
 create_beast2_input_file(
   get_fasta_filename(),
```

```
  beast2_input_file,
  mcmc = mcmc
)
expect_true(file.exists(beast2_input_file))
```

`create_test_ns_inference_model` *Create an inference model to be tested by Nested Sampling*

Description

Create an inference model to be tested by Nested Sampling

Usage

```
create_test_ns_inference_model(
  site_model = beautier::create_jc69_site_model(),
  clock_model = beautier::create_strict_clock_model(),
  tree_prior = beautier::create_yule_tree_prior(),
  mcmc = beautier::create_test_ns_mcmc()
)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`
`clock_model`	a clock model, as returned by `create_clock_model`
`tree_prior`	a tree priors, as returned by `create_tree_prior`
`mcmc`	one MCMC. Use `create_mcmc` to create an MCMC. Use `create_ns_mcmc` to create an MCMC for a Nested Sampling run. Use `check_mcmc` to check if an MCMC is valid. Use `rename_mcmc_filenames` to rename the filenames in an MCMC.

`create_test_ns_mcmc` *Create an NS MCMC object for testing*

Description

Create an NS MCMC object for testing

Usage

```
create_test_ns_mcmc(
  chain_length = 2000,
  store_every = 1000,
  pre_burnin = 0,
  n_init_attempts = 3,
  particle_count = 1,
  sub_chain_length = 500,
  epsilon = 1e-12,
  tracelog = create_test_tracelog(),
  screenlog = create_test_screenlog(),
  treelog = create_test_treelog()
)
```

Arguments

`chain_length`	upper bound to the length of the MCMC chain
`store_every`	number of states the MCMC will process before the posterior's state will be saved to file. Use -1 or `NA` to use the default frequency.
`pre_burnin`	number of burn in samples taken before entering the main loop
`n_init_attempts`	number of initialization attempts before failing
`particle_count`	number of particles
`sub_chain_length`	sub-chain length
`epsilon`	epsilon
`tracelog`	a `tracelog`, as created by create_tracelog
`screenlog`	a `screenlog`, as created by create_screenlog
`treelog`	a `treelog`, as created by create_treelog

Value

an MCMC object

Author(s)

Richèl J.C. Bilderbeek

See Also

Use `create_ns_mcmc` to create a default nested sampling MCMC

Examples

```
library(testthat)

mcmc <- create_test_ns_mcmc()

beast2_input_file <- tempfile(fileext = ".xml")

create_beast2_input_file(
  get_fasta_filename(),
  beast2_input_file,
  mcmc = mcmc
)

expect_true(file.exists(beast2_input_file))
```

---

create_test_screenlog *Create a* screenlog *object*

Description

Create a screenlog object

Usage

```
create_test_screenlog(
  filename = create_temp_screenlog_filename(),
  log_every = 1000,
  mode = "autodetect",
  sanitise_headers = FALSE,
  sort = "none"
)
```

Arguments

filename	name of the file to store the posterior screens phylogenies to. By default, this is $(screen).screens
log_every	number of MCMC states between writing to file
mode	mode how to log. Valid values are the ones returned by get_log_modes
sanitise_headers	set to TRUE to sanitise the headers of the log file
sort	how to sort the log. Valid values are the ones returned by get_log_sorts

create_test_tracelog *Create a* tracelog *object*

Description

Create a tracelog object

Usage

```
create_test_tracelog(
  filename = create_temp_tracelog_filename(),
  log_every = 1000,
  mode = "autodetect",
  sanitise_headers = TRUE,
  sort = "smart"
)
```

Arguments

filename	name of the file to store the posterior traces. Use NA to use the filename [alignment_id].log, where alignment_id is obtained using get_alignment_id
log_every	number of MCMC states between writing to file
mode	mode how to log. Valid values are the ones returned by get_log_modes
sanitise_headers	set to TRUE to sanitise the headers of the log file
sort	how to sort the log. Valid values are the ones returned by get_log_sorts

create_test_treelog *Create a* treelog *object*

Description

Create a treelog object

Usage

```
create_test_treelog(
  filename = create_temp_treelog_filename(),
  log_every = 1000,
  mode = "tree",
  sanitise_headers = FALSE,
  sort = "none"
)
```

Arguments

filename	name of the file to store the posterior trees
log_every	number of MCMC states between writing to file
mode	mode how to log. Valid values are the ones returned by get_log_modes
sanitise_headers	set to TRUE to sanitise the headers of the log file
sort	how to sort the log. Valid values are the ones returned by get_log_sorts

---

create_tn93_site_model

Create a TN93 site model

Description

Create a TN93 site model

Usage

```
create_tn93_site_model(
  id = NA,
  gamma_site_model = create_gamma_site_model(),
  kappa_1_param = create_kappa_1_param(),
  kappa_2_param = create_kappa_2_param(),
  kappa_1_prior_distr = create_log_normal_distr(m = 1, s = 1.25),
  kappa_2_prior_distr = create_log_normal_distr(m = 1, s = 1.25),
  freq_equilibrium = "estimated"
)
```

Arguments

id	the IDs of the alignment (can be extracted from the FASTA filename using get_alignment_id)
gamma_site_model	a gamma site model, as created by create_gamma_site_model
kappa_1_param	the 'kappa 1' parameter, a numeric value. For advanced usage, use the structure as returned by create_kappa_1_param
kappa_2_param	the 'kappa 2' parameter, a numeric value. For advanced usage, use the structure as returned by create_kappa_2_param
kappa_1_prior_distr	the distribution of the kappa 1 prior, which is a log-normal distribution (as created by create_log_normal_distr) by default
kappa_2_prior_distr	the distribution of the kappa 2 prior, which is a log-normal distribution (as created by create_log_normal_distr) by default

freq_equilibrium
: the frequency in which the rates are at equilibrium are either `estimated`, `empirical` or `all_equal`. `get_freq_equilibrium_names` returns the possible values for `freq_equilibrium`

Value

a TN93 site_model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
tn93_site_model <- create_tn93_site_model(
  kappa_1_param = 2.0,
  kappa_2_param = 2.0
)

create_beast2_input_file(
  input_filename = get_fasta_filename(),
  output_filename = tempfile(pattern = "beast", fileext = ".xml"),
  site_model = tn93_site_model
)
```

---

create_tn93_subst_model_xml

Converts a TN93 site model to XML, used in the `substModel` *section*

Description

Converts a TN93 site model to XML, used in the `substModel` section

Usage

```
create_tn93_subst_model_xml(site_model)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`

Value

the site model as XML text

Author(s)

Richèl J.C. Bilderbeek

create_tracelog *Create a* tracelog *object*

Description

Create a tracelog object

Usage

```
create_tracelog(
  filename = NA,
  log_every = 1000,
  mode = "autodetect",
  sanitise_headers = TRUE,
  sort = "smart"
)
```

Arguments

filename	name of the file to store the posterior traces. Use NA to use the filename [alignment_id].log, where alignment_id is obtained using get_alignment_id
log_every	number of MCMC states between writing to file
mode	mode how to log. Valid values are the ones returned by get_log_modes
sanitise_headers	set to TRUE to sanitise the headers of the log file
sort	how to sort the log. Valid values are the ones returned by get_log_sorts

create_tracelog_xml *Creates the* tracelog *section of the* logger *section of a BEAST2 XML parameter file*

Description

Creates the tracelog section of the logger section of a BEAST2 XML parameter file

Usage

```
create_tracelog_xml(input_filename, inference_model)
```

Arguments

input_filename	A FASTA filename. Use get_fasta_filename to obtain a testing FASTA filename.
inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Author(s)

Richèl J.C. Bilderbeek

---

create_trait_set_string

Create a trait set string.

Description

For example, a data frame with row A 1 and another row B 2, the trait set string will be A=1,B=2

Usage

```
create_trait_set_string(df)
```

Arguments

df	a data frame with two columns

Value

the trait set string

Author(s)

Richèl J.C. Bilderbeek

create_treelog *Create a* treelog *object*

Description

Create a treelog object

Usage

```
create_treelog(
  filename = "$(tree).trees",
  log_every = 1000,
  mode = "tree",
  sanitise_headers = FALSE,
  sort = "none"
)
```

Arguments

filename	name of the file to store the posterior trees
log_every	number of MCMC states between writing to file
mode	mode how to log. Valid values are the ones returned by get_log_modes
sanitise_headers	set to TRUE to sanitise the headers of the log file
sort	how to sort the log. Valid values are the ones returned by get_log_sorts

create_treelog_xml *Creates the XML text for the* logger *tag with ID* treelog*. This section has these elements:*

```
<logger id="treelog.t:test_output_0"
spec="Logger" fileName="my_treelog.trees"
logEvery="345000" mode="tree" sanitiseHeaders="true"
sort="smart"> # nolint indeed long <log
id="TreeWithMetaDataLogger.t:test_output_0"
spec="beast.evolution.tree.TreeWithMetaDataLogger"
tree="@Tree.t:test_output_0"/> # nolint indeed long
</logger>
```

Description

Creates the XML text for the logger tag with ID treelog. This section has these elements:

```
<logger id="treelog.t:test_output_0" spec="Logger" fileName="my_treelog.trees" logEvery="345000" mode
   <log id="TreeWithMetaDataLogger.t:test_output_0" spec="beast.evolution.tree.TreeWithMetaDataLogge
</logger>
```

Usage

```
create_treelog_xml(inference_model)
```

Arguments

`inference_model`
: a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Author(s)

Richèl J.C. Bilderbeek

---

create_tree_likelihood_distr_xml

Creates the XML text for the `distribution` *tag with the* `treeLikelihood` *ID, of a BEAST2 parameter file.*

Description

Creates the XML text for the `distribution` tag with the `treeLikelihood` ID, of a BEAST2 parameter file, in an unindented form

Usage

```
create_tree_likelihood_distr_xml(inference_model)
```

Arguments

`inference_model`
: a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Details

The `distribution` tag (with ID equals `treeLikelihood`) has these elements:

```
<distribution id="treeLikelihood"[...]>
   <siteModel[...]>
     [...]
   </siteModel>
```

```
    <branchRateModel[...]>
      [...]
    </branchRateModel>
  </distribution>
```

The `siteModel` section is created by create_site_model_xml. The `branchRateModel` section is created by create_branch_rate_model_xml.

Zooming out:

```
<beast[...]>
  <run[...]>
    <distribution id="posterior"[...]>
      <distribution id="likelihood"[...]>
        [this section]
      </distribution>
    </distribution>
  </run>
</beast>
```

Note

this function is not intended for regular use, thus its long name length is accepted

Author(s)

Richèl J.C. Bilderbeek

See Also

this function is called by `create_beast2_input_distr`, together with `create_beast2_input_distr_prior`

`create_tree_prior` *Internal function to create a tree prior*

Description

Internal function to create a tree prior

Usage

```
create_tree_prior(name, id, ...)
```

Arguments

`name`	the tree prior name. Can be any name in `get_tree_prior_names`
`id`	the ID of the alignment
`...`	specific tree prior parameters

Value

a tree_prior

Note

Prefer the use the named functions create_bd_tree_prior, create_cbs_tree_prior, create_ccp_tree_prior create_cep_tree_prior and create_yule_tree_prior instead

Author(s)

Richèl J.C. Bilderbeek

See Also

See create_bd_tree_prior, create_cbs_tree_prior, create_ccp_tree_prior create_cep_tree_prior and create_yule_tree_prior for more examples using those functions

Examples

```
beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_bd_tree_prior()
)
testit::assert(file.exists(beast2_input_file))

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_beautier_path("test_output_6.fas"),
  beast2_input_file,
  tree_prior = create_cbs_tree_prior()
)
testit::assert(file.exists(beast2_input_file))

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_ccp_tree_prior()
)
testit::assert(file.exists(beast2_input_file))

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_cep_tree_prior()
)
testit::assert(file.exists(beast2_input_file))

beast2_input_file <- tempfile(fileext = ".xml")
```

```
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior()
)
testit::assert(file.exists(beast2_input_file))
```

`create_tree_priors` *Creates all supported tree priors, which is a list of the types returned by* `create_bd_tree_prior`*,* `create_cbs_tree_prior`*,* `create_ccp_tree_prior`*,* `create_cep_tree_prior` *and* `create_yule_tree_prior`

Description

Creates all supported tree priors, which is a list of the types returned by `create_bd_tree_prior`, `create_cbs_tree_prior`, `create_ccp_tree_prior`, `create_cep_tree_prior` and `create_yule_tree_prior`

Usage

```
create_tree_priors()
```

Value

a list of tree_priors

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

tree_priors <- create_tree_priors()
expect_true(is_bd_tree_prior(tree_priors[[1]]))
expect_true(is_cbs_tree_prior(tree_priors[[2]]))
expect_true(is_ccp_tree_prior(tree_priors[[3]]))
expect_true(is_cep_tree_prior(tree_priors[[4]]))
expect_true(is_yule_tree_prior(tree_priors[[5]]))
```

`create_uniform_distr` *Create a uniform distribution*

Description

Create a uniform distribution

Usage

```
create_uniform_distr(id = NA, upper = Inf)
```

Arguments

`id`	the distribution's ID
`upper`	an upper limit of the uniform distribution. If the upper limits needs to be infinity, set `upper` to `Inf`.

Value

a uniform distribution

Author(s)

Richèl J.C. Bilderbeek

See Also

the function `create_distr` shows an overview of all supported distributions

Examples

```
uniform_distr <- create_uniform_distr()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = create_yule_tree_prior(
    birth_rate_distr = uniform_distr
  )
)
testit::assert(file.exists(beast2_input_file))
```

create_xml_declaration *Create the XML declaration of the BEAST2 XML input file*

Description

Create the XML declaration of the BEAST2 XML input file

Usage

```
create_xml_declaration()
```

Value

one line of XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

created <- create_xml_declaration()
expected <- "<?xml version=\"1.0\" encoding=\"UTF-8\" standalone=\"no\"?>"
expect_equal(created, expected)
```

create_yule_tree_prior *Create a Yule tree prior*

Description

Create a Yule tree prior

Usage

```
create_yule_tree_prior(
  id = NA,
  birth_rate_distr = create_uniform_distr()
)
```

Arguments

`id`	the ID of the alignment
`birth_rate_distr`	the birth rate distribution, as created by a `create_distr` function

Value

a Yule tree_prior

Author(s)

Richèl J.C. Bilderbeek

See Also

An alignment ID can be extracted from its FASTA filename using `get_alignment_id`

Examples

```
yule_tree_prior <- create_yule_tree_prior()

beast2_input_file <- tempfile(fileext = ".xml")
create_beast2_input_file(
  input_filename = get_fasta_filename(),
  beast2_input_file,
  tree_prior = yule_tree_prior
)
testit::assert(file.exists(beast2_input_file))
```

`default_parameters_doc`

Documentation of parameters (for example, `create_param`*. This function does nothing. It is intended to inherit documentation from.*

Description

Documentation of parameters (for example, `create_param`. This function does nothing. It is intended to inherit documentation from.

Usage

```
default_parameters_doc(estimate, id, lower, name, upper, value, ...)
```

Arguments

estimate	TRUE if this parameter is to be estimated by BEAST2, FALSE otherwise
id	the parameter's ID
lower	lowest possible value of the parameter. If the parameter is estimated, lower must be less than value
name	the parameters' name. Valid names can be found in get_param_names
upper	upper value of the parameter
value	value of the parameter
...	specific parameter parameters

Note

This is an internal function, so it should be marked with @export. This is not done, as this will disallow all functions to find the documentation parameters

Author(s)

Richèl J.C. Bilderbeek

---

default_params_doc *Documentation of general function arguments. This function does nothing. It is intended to inherit function argument documentation.*

Description

Documentation of general function arguments. This function does nothing. It is intended to inherit function argument documentation.

Usage

```
default_params_doc(
  alignment_id,
  bd_tree_prior,
  cbs_tree_prior,
  beast2_version,

  treelog,
  tree_prior,
  tree_prior_name,
  tree_prior_names,
  tree_priors,
  verbose,
  yule_tree_prior
)
```

Arguments

alignment_id	ID of the alignment, as returned by get_alignment_id. Keep at NA to have it initialized automatically
bd_tree_prior	a Birth-Death tree prior, as created by create_bd_tree_prior
cbs_tree_prior	a Coalescent Bayesian Skyline tree prior, as returned by create_cbs_tree_prior
beast2_version	BEAST2 version, for example, code"2.5"
beauti_options	one BEAUti options object, as returned by create_beauti_options
ccp_tree_prior	a Coalescent Constant Population tree prior, as returned by create_ccp_tree_prior
cep_tree_prior	a Coalescent Exponential Population tree prior, as returned by create_cep_tree_prior
chain_length	length of the MCMC chain
clock_model	a clock model, as returned by create_clock_model
clock_model_name	name of a clock model, must be a name as returned by get_clock_model_names
clock_model_names	one or more names of a clock model, must be name among those returned by get_clock_model_names
clock_models	a list of one or more clock models, as returned by create_clock_model
clock_prior_distr_id	ID of an MRCA clock model's distribution. Keep at NA to have it initialized automatically
crown_age	the crown age of the phylogeny
crown_ages	the crown ages of the phylogenies. Set to NA if the crown age needs to be estimated
distr_id	a distributions' ID
fasta_filename	a FASTA filename. Use get_fasta_filename to obtain a testing FASTA filename.
fasta_filenames	One or more FASTA filenames. Use get_fasta_filename to obtain a testing FASTA filename.

`fixed_crown_age`
: determines if the phylogeny's crown age is fixed. If FALSE, crown age is estimated by BEAST2. If TRUE, the crown age is fixed to the crown age of the initial phylogeny.

`fixed_crown_ages`
: one or more booleans to determine if the phylogenies' crown ages are fixed. If FALSE, crown age is estimated by BEAST2. If TRUE, the crown age is fixed to the crown age of the initial phylogeny.

`gamma_site_model`
: a site model's gamma site model, as returned by `create_gamma_site_model`

`group_sizes_dimension`
: the group sizes' dimension, as used by the CBS tree prior (see `create_cbs_tree_prior`)

`gtr_site_model`
: a GTR site model, as returned by `create_gtr_site_model`

`has_non_strict_clock_model`
: boolean to indicate that the is already at least one non-strict (i.e. relaxed log-normal) clock model

`has_tip_dating`
: TRUE if the user has supplied tip dates, FALSE otherwise

`hky_site_model`
: an HKY site model, as returned by `create_hky_site_model`

`id`
: an alignment's IDs. An ID can be extracted from its FASTA filename with `get_alignment_ids_from_fasta_filenames`)

`ids`
: one or more alignments' IDs. IDs can be extracted from their FASTA filenames with `get_alignment_ids_from_fasta_filenames`)

`inference_model`
: a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

`inference_models`
: a list of one or more inference models, as can be created by create_inference_model

`initial_phylogenies`
: one or more MCMC chain's initial phylogenies. Each one set to `NA` will result in BEAST2 using a random phylogeny. Else the phylogeny is assumed to be of class `phylo` from the `ape` package

`input_filename`
: A FASTA filename. Use `get_fasta_filename` to obtain a testing FASTA filename.

`input_filenames`
: One or more FASTA filenames. Use `get_fasta_filename` to obtain a testing FASTA filename.

`is_monophyletic`
: boolean to indicate monophyly is assumed in a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`

`jc69_site_model`
: a JC69 site model, as returned by `create_jc69_site_model`

`log_every`
: number of MCMC states between writing to file

`mcmc` one MCMC. Use `create_mcmc` to create an MCMC. Use `create_ns_mcmc` to create an MCMC for a Nested Sampling run. Use `check_mcmc` to check if an MCMC is valid. Use `rename_mcmc_filenames` to rename the filenames in an MCMC.

`mode` mode how to log. Valid values are the ones returned by get_log_modes

`mrca_prior` a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`

`mrca_priors` a list of one or more Most Recent Common Ancestor priors, as returned by `create_mrca_prior`

`mrca_prior_name` the unique name of the MRCA prior, for example a genus, family, order or even class name. Leave at NA to have it named automatically.

`n_init_attempts` number of initialization attempts before failing

`output_filename` Name of the XML parameter file created by this function. BEAST2 uses this file as input.

`param` a parameter, as can be created by `create_param`.

`param_id` a parameter's ID

`phylogeny` a phylogeny of type `phylo` from the ape package

`posterior_crown_age` deprecated

`pre_burnin` number of burn in samples taken before entering the main loop

`rename_fun` a function to rename a filename, as can be checked by check_rename_fun. This function should have one argument, which will be a filename or NA. The function should return one filename (when passed one filename) or one NA (when passed one NA). Example rename functions are:

- get_remove_dir_fun get a function that removes the directory paths from the filenames, in effect turning these into local files
- get_replace_dir_fun get a function that replaces the directory paths from the filenames
- get_remove_hex_fun get a function that removes the hex string from filenames. For example, `tracelog_82c1a522040.log` becomes `tracelog.log`

`rln_clock_model` a Relaxed Log-Normal clock model, as returned by `create_rln_clock_model`

`sample_from_prior` set to TRUE to sample from the prior

`sanitise_headers` set to TRUE to sanitise the headers of the log file

`screenlog` a `screenlog`, as created by create_screenlog

`sequence_length` a DNA sequence length, in base pairs

`site_model` a site model, as returned by `create_site_model`

site_model_name
: name of a site model, must be a name as returned by get_site_model_names

site_model_names
: one or more names of a site model, must be name among those returned by get_site_model_names

site_models
: one or more site models, as returned by create_site_model

sort
: how to sort the log. Valid values are the ones returned by get_log_sorts

store_every
: number of states the MCMC will process before the posterior's state will be saved to file. Use -1 or NA to use the default frequency.

strict_clock_model
: a strict clock model, as returned by create_strict_clock_model

taxa_names
: names of the taxa, as returned by get_taxa_names. Keep at NA to have it initialized automatically, using all taxa in the alignment

tipdates_filename
: name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

tn93_site_model
: a TN93 site model, as returned by create_tn93_site_model

tracelog
: a tracelog, as created by create_tracelog

treelog
: a treelog, as created by create_treelog

tree_prior
: a tree priors, as returned by create_tree_prior

tree_prior_name
: name of a tree prior, must be a name as returned by get_tree_prior_names

tree_prior_names
: one or more names of a tree prior, must be a name among those returned by get_tree_prior_names

tree_priors
: one or more tree priors, as returned by create_tree_prior

verbose
: if TRUE, additional information is displayed, that is potentially useful in debugging

yule_tree_prior
: a Yule tree_prior, as created by create_yule_tree_prior

Note

This is an internal function, so it should be marked with @export. This is not done, as this will disallow all functions to find the documentation parameters

Author(s)

Richèl J.C. Bilderbeek

distr_to_xml *Converts a distribution to XML*

Description

Converts a distribution to XML

Usage

```
distr_to_xml(distr)
```

Arguments

distr	a distribution, as created by create_distr)

Value

the distribution as XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

xml <- distr_to_xml(create_uniform_distr(id = 1))
expect_true(is.character(xml))
expect_true(length(xml) == 1)
expect_true(nchar(xml) > 1)
```

distr_to_xml_beta *Converts a beta distribution to XML*

Description

Converts a beta distribution to XML

Usage

```
distr_to_xml_beta(distr)
```

Arguments

distr	a beta distribution, as created by create_beta_distr)

Value

the distribution as XML text

Author(s)

Richèl J.C. Bilderbeek

`distr_to_xml_exp` *Converts an exponential distribution to XML*

Description

Converts an exponential distribution to XML

Usage

```
distr_to_xml_exp(distr)
```

Arguments

`distr`	an exponential distribution, as created by `create_exp_distr`)

Value

the distribution as XML text

Author(s)

Richèl J.C. Bilderbeek

`distr_to_xml_gamma` *Converts a gamma distribution to XML*

Description

Converts a gamma distribution to XML

Usage

```
distr_to_xml_gamma(distr)
```

Arguments

`distr`	a gamma distribution, as created by `create_gamma_distr`)

Value

the distribution as XML text

Author(s)

Richèl J.C. Bilderbeek

---

distr_to_xml_inv_gamma *Converts an inverse-gamma distribution to XML*

Description

Converts an inverse-gamma distribution to XML

Usage

```
distr_to_xml_inv_gamma(distr)
```

Arguments

distr	an inverse-gamma distribution, as created by create_inv_gamma_distr)

Value

the distribution as XML text

Author(s)

Richèl J.C. Bilderbeek

---

distr_to_xml_laplace *Converts a Laplace distribution to XML*

Description

Converts a Laplace distribution to XML

Usage

```
distr_to_xml_laplace(distr)
```

Arguments

distr	a Laplace distribution as created by create_laplace_distr)

Value

the distribution as XML text

Author(s)

Richèl J.C. Bilderbeek

`distr_to_xml_log_normal` *Converts a log-normal distribution to XML*

Description

Converts a log-normal distribution to XML

Usage

```
distr_to_xml_log_normal(distr)
```

Arguments

`distr`	a log-normal distribution, as created by `create_log_normal_distr`)

Value

the distribution as XML text

Author(s)

Richèl J.C. Bilderbeek

`distr_to_xml_normal` *Converts a normal distribution to XML*

Description

Converts a normal distribution to XML

Usage

```
distr_to_xml_normal(distr)
```

Arguments

`distr`	a normal distribution, as created by `create_normal_distr`)

Value

the distribution as XML text

Author(s)

Richèl J.C. Bilderbeek

`distr_to_xml_one_div_x` *Converts a 1/x distribution to XML*

Description

Converts a 1/x distribution to XML

Usage

```
distr_to_xml_one_div_x(distr)
```

Arguments

`distr`	a 1/x distribution, as created by `create_one_div_x_distr`)

Value

the distribution as XML text

Author(s)

Richèl J.C. Bilderbeek

`distr_to_xml_poisson` *Converts a Poisson distribution to XML*

Description

Converts a Poisson distribution to XML

Usage

```
distr_to_xml_poisson(distr)
```

Arguments

`distr`	a Poisson distribution, as created by `create_poisson_distr`)

Value

the distribution as XML text

Author(s)

Richèl J.C. Bilderbeek

---

distr_to_xml_uniform *Converts a uniform distribution to XML*

Description

Converts a uniform distribution to XML

Usage

```
distr_to_xml_uniform(distr)
```

Arguments

distr	a uniform distribution, as created by create_uniform_distr)

Value

the distribution as XML text

Author(s)

Richèl J.C. Bilderbeek

---

extract_xml_loggers_from_lines *Extract everything between first loggers and last loggers line*

Description

Extract everything between first loggers and last loggers line

Usage

```
extract_xml_loggers_from_lines(lines)
```

Arguments

lines	lines of text

Value

lines of text from the first to and including the last operators line

Author(s)

Richèl J.C. Bilderbeek

`extract_xml_operators_from_lines` *Extract everything between first operators and last operators line*

Description

Extract everything between first operators and last operators line

Usage

```
extract_xml_operators_from_lines(lines)
```

Arguments

`lines`	lines of text

Value

lines of text from the first to and including the last operators line

Author(s)

Richèl J.C. Bilderbeek

`extract_xml_section_from_lines` *Get the lines of an XML section, including the section tags*

Description

Get the lines of an XML section, including the section tags

Usage

```
extract_xml_section_from_lines(lines, section)
```

Arguments

lines	lines of the XML text
section	the XML section name

Value

the section's lines of XML text, including the tags

Author(s)

Richèl J.C. Bilderbeek

---

fasta_file_to_sequences

Convert a FASTA file to a table of sequences

Description

Convert a FASTA file to a table of sequences

Usage

```
fasta_file_to_sequences(fasta_filename)
```

Arguments

fasta_filename	One existing FASTA filenames

Value

a table of sequences

Author(s)

Richèl J.C. Bilderbeek

find_clock_model *Finds a clock model with a certain ID*

Description

Finds a clock model with a certain ID

Usage

```
find_clock_model(clock_models, id)
```

Arguments

clock_models	a list of one or more clock models, as returned by create_clock_model
id	the ID of the clock model

Value

the clock models with the desired ID, NULL if such a clock model is absent

Author(s)

Richèl J.C. Bilderbeek

find_first_regex_line *Find the first line that satisfies a regex*

Description

Find the first line that satisfies a regex

Usage

```
find_first_regex_line(lines, regex)
```

Arguments

lines	lines of text
regex	the regex as text

Value

index of the line

Author(s)

Richèl J.C. Bilderbeek

find_first_xml_opening_tag_line *Find the line number of the first section's opening tag*

Description

Find the line number of the first section's opening tag

Usage

```
find_first_xml_opening_tag_line(lines, section)
```

Arguments

lines	the lines of an XML text
section	the name of the XML section

Value

the line number's index (which is 1 for the first line) if the opening tag is found, else NA

Author(s)

Richèl J.C. Bilderbeek

find_last_regex_line *Find the index of the last line that matches a regex*

Description

Find the index of the last line that matches a regex

Usage

```
find_last_regex_line(lines, regex)
```

Arguments

lines	lines of text
regex	regex string

Value

index of the line

Author(s)

Richèl J.C. Bilderbeek

`find_last_xml_closing_tag_line` *Find the highest line number of a section's closing tag*

Description

Find the highest line number of a section's closing tag

Usage

```
find_last_xml_closing_tag_line(lines, section)
```

Arguments

`lines`	the lines of an XML text
`section`	the name of the XML section

Value

the line number's index (which is 1 for the first line) if the opening tag is found, else NA

Author(s)

Richèl J.C. Bilderbeek

`freq_equilibrium_to_xml` *Creates the* `freq_equilibrium` *as XML*

Description

Creates the `freq_equilibrium` as XML

Usage

```
freq_equilibrium_to_xml(freq_equilibrium, id)
```

Arguments

`freq_equilibrium`	a `freq_equilibrium` name
`id`	a site model's name

Value

the `freq_equilibrium` as XML

Author(s)

Richèl J.C. Bilderbeek

`gamma_site_models_to_xml_prior_distr`
Creates the gamma site models section in the distribution section of a BEAST2 XML parameter file

---

Description

Creates the gamma site models section in the distribution section of a BEAST2 XML parameter file

Usage

```
gamma_site_models_to_xml_prior_distr(site_models)
```

Arguments

`site_models`	one or more site models, as returned by `create_site_model`

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

`gamma_site_model_to_xml_prior_distr`
Creates the gamma site models section in the distribution section of a BEAST2 XML parameter file

---

Description

Creates the gamma site models section in the distribution section of a BEAST2 XML parameter file

Usage

```
gamma_site_model_to_xml_prior_distr(site_model)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

---

gamma_site_model_to_xml_state *Converts a gamma site model to XML, used in the* state *section*

Description

Converts a gamma site model to XML, used in the state section

Usage

```
gamma_site_model_to_xml_state(gamma_site_model, id)
```

Arguments

gamma_site_model	a gamma site model, as created by create_gamma_site_model)
id	the site model's ID

Value

the gamma_site model as XML text

Author(s)

Richèl J.C. Bilderbeek

---

get_alignment_id *Conclude the ID from a FASTA filename.*

Description

This is done in the same way as BEAST2 will do so.

Usage

```
get_alignment_id(fasta_filename, capitalize_first_char_id = FALSE)
```

Arguments

fasta_filename	a FASTA filename. Use get_fasta_filename to obtain a testing FASTA filename.
capitalize_first_char_id	if TRUE, the first character will be capitalized

Value

an alignment's ID

Author(s)

Richèl J.C. Bilderbeek

See Also

Use check_alignment_id to check if an alignment ID is valid.

Examples

```
library(testthat)

# Path need not exist, use UNIX path as example
created <- get_alignment_id("/home/homer/anthus_aco_sub.fas")
expected <- "anthus_aco_sub"
expect_equal(created, expected)
expect_silent(check_alignment_id(created))
```

---

get_alignment_ids *Get the alignment IDs from one or more files.*

Description

This is done in the same way as BEAST2 does by default The file extension will be used to determine which type of file is worked on.

Usage

```
get_alignment_ids(filenames)
```

Arguments

filenames	names of the files to be checked

Value

the IDs extracted from the one or more files

Author(s)

Richèl J.C. Bilderbeek

See Also

Use get_alignment_ids_from_fasta_filenames to get the alignment IDs from files known to be FASTA files

Examples

```
created <- get_alignment_ids(
  get_beautier_paths(c("anthus_aco.fas", "anthus_nd2.fas"))
)
expected <- c(
  get_alignment_id(get_beautier_path("anthus_aco.fas")),
  get_alignment_id(get_beautier_path("anthus_nd2.fas"))
)
testit::assert(created == expected)
```

---

get_alignment_ids_from_fasta_filenames

Get the alignment ID from one or more FASTA filenames.

Description

This is done in the same way as BEAST2 does by default. The files are assumed to be FASTA. If this is not the case, there may be any kind of error message when calling this function.

Usage

```
get_alignment_ids_from_fasta_filenames(fasta_filenames)
```

Arguments

fasta_filenames	One or more FASTA filenames. Use get_fasta_filename to obtain a testing FASTA filename.

Value

the IDs from one or more FASTA files

Author(s)

Richèl J.C. Bilderbeek

See Also

Use get_alignment_ids to get the alignment IDs from multiple kids of files. Use are_fasta_filenames to see if the filenames all have a common FASTA filename extension.

Examples

```
created <- get_alignment_ids_from_fasta_filenames(
  get_beautier_paths(c("anthus_aco.fas", "anthus_nd2.fas"))
)
expected <- c(
  get_alignment_id(get_beautier_path("anthus_aco.fas")),
  get_alignment_id(get_beautier_path("anthus_nd2.fas"))
)
testit::assert(created == expected)
```

---

get_beautier_path *Get the full path of a file in the* inst/extdata *folder*

Description

Get the full path of a file in the inst/extdata folder

Usage

```
get_beautier_path(filename)
```

Arguments

filename	the file's name, without the path

Value

the full path of the filename

Author(s)

Richèl J.C. Bilderbeek

See Also

for more files, use get_beautier_paths

Examples

```
library(testthat)

expect_true(is.character(get_beautier_path("test_output_0.fas")))
expect_true(is.character(get_beautier_path("anthus_aco.fas")))
expect_true(is.character(get_beautier_path("anthus_nd2.fas")))
```

`get_beautier_paths` *Get the full paths of files in the* `inst/extdata` *folder*

Description

Get the full paths of files in the `inst/extdata` folder

Usage

```
get_beautier_paths(filenames)
```

Arguments

`filenames`	the files' names, without the path

Value

the filenames' full paths

Author(s)

Richèl J.C. Bilderbeek

See Also

Use get_beautier_path to get the path of one file

for one file, use `get_beautier_path`

Examples

```
testit::assert(
  length(
    get_beautier_paths(
      c("test_output_0.fas", "anthus_aco.fas", "anthus_nd2.fas")
    )
   ) == 3
 )
```

get_clock_models_ids *Collect the IDs of the list of clock models*

Description

Collect the IDs of the list of clock models

Usage

```
get_clock_models_ids(clock_models)
```

Arguments

clock_models	a list of one or more clock models, as returned by create_clock_model

Value

IDs of the clock models

Author(s)

Richèl J.C. Bilderbeek

get_clock_model_name *Get the BEAUti name for a clock model*

Description

Will stop if the clock model is an invalid clock model

Usage

```
get_clock_model_name(clock_model)
```

Arguments

clock_model	a clock model, as returned by create_clock_model

Value

name of the clock model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_equal(
  get_clock_model_name(create_strict_clock_model()),
  "StrictClock"
)

expect_equal(
  get_clock_model_name(create_rln_clock_model()),
  "RelaxedClock"
)
```

---

get_clock_model_names *Get the clock model names*

Description

Get the clock model names

Usage

```
get_clock_model_names()
```

Value

the clock model names

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_clock_models to create a list with all clock models

Examples

```
library(testthat)

names <- get_clock_model_names()
expect_true("relaxed_log_normal" %in% names)
expect_true("strict" %in% names)
```

get_crown_age *Obtain the crown age of a phylogeny.*

Description

The crown age of a phylogeny is the time between the present and the moment of at which the first diversification (resulting in two lineages) happened.

Usage

```
get_crown_age(phylogeny)
```

Arguments

phylogeny	The phylogeny to obtain the crown age of

Value

the crown age of the phylogeny

Author(s)

Richèl J.C. Bilderbeek

Examples

```
phylogeny <- ape::read.tree(text = "(a:15,b:15):1;")
created <- get_crown_age(phylogeny = phylogeny)
testit::assert(created == 15)
```

get_distr_names *Get the distribution names*

Description

Get the distribution names

Usage

```
get_distr_names()
```

Value

the distribution names

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

names <- get_distr_names()

expect_true("uniform" %in% names)
expect_true("normal" %in% names)
expect_true("one_div_x" %in% names)
expect_true("log_normal" %in% names)
expect_true("exponential" %in% names)
expect_true("gamma" %in% names)
expect_true("beta" %in% names)
expect_true("laplace" %in% names)
expect_true("inv_gamma" %in% names)
expect_true("poisson" %in% names)
```

---

get_distr_n_params *Get the number of parameters a distribution uses*

Description

Get the number of parameters a distribution uses

Usage

```
get_distr_n_params(distr)
```

Arguments

distr	a distribution, as created by create_distr or (preferable) its named functions

Value

the number of parameters that distribution uses

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)
expect_equal(get_distr_n_params(create_beta_distr()), 2)
expect_equal(get_distr_n_params(create_exp_distr()), 1)
expect_equal(get_distr_n_params(create_gamma_distr()), 2)
expect_equal(get_distr_n_params(create_inv_gamma_distr()), 2)
expect_equal(get_distr_n_params(create_laplace_distr()), 2)
expect_equal(get_distr_n_params(create_log_normal_distr()), 2)
expect_equal(get_distr_n_params(create_normal_distr()), 2)
expect_equal(get_distr_n_params(create_one_div_x_distr()), 0)
expect_equal(get_distr_n_params(create_poisson_distr()), 1)
expect_equal(get_distr_n_params(create_uniform_distr()), 0)
```

---

get_fasta_filename *Get the path of a FASTA file used in testing*

Description

Get the path of a FASTA file used in testing

Usage

```
get_fasta_filename()
```

Value

the path of a FASTA file used in testing

Author(s)

Richèl J.C. Bilderbeek

Examples

```
filename <- beautier::get_fasta_filename()
testit::assert(file.exists(filename))

create_beast2_input_file(
  input_filename = filename,
  output_filename = tempfile(pattern = "beast", fileext = ".xml")
)
```

get_file_base_sans_ext

Get the base of the filename base without extension

Description

The path need not to actually exist

Usage

```
get_file_base_sans_ext(filename)
```

Arguments

filename	A filename

Value

That filename without its full path and extension

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

# Path need not exist, use UNIX path as example
expect_equal(
  get_file_base_sans_ext("/home/homer/test.txt"),
  "test"
)
```

get_freq_equilibrium_names

Returns valid values for the `freq_equilibrium` *argument*

Description

Returns valid values for the `freq_equilibrium` argument

Usage

```
get_freq_equilibrium_names()
```

Value

the valid values for the `freq_equilibrium` argument

Author(s)

Richèl J.C. Bilderbeek

See Also

the `freq_equilibrium` argument is used in `create_gtr_site_model`, `create_hky_site_model`, and `create_tn93_site_model`

Examples

```
library(testthat)

names <- get_freq_equilibrium_names()
expect_true("estimated" %in% names)
expect_true("empirical" %in% names)
expect_true("all_equal" %in% names)
```

---

get_gamma_site_model_n_distrs

Get the number of distributions in a gamma site model

Description

Get the number of distributions in a gamma site model

Usage

```
get_gamma_site_model_n_distrs(gamma_site_model)
```

Arguments

`gamma_site_model`
: a site model's gamma site model, as returned by `create_gamma_site_model`

Value

the number of distributions a gamma site model has

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_gamma_site_model to create a gamma site model

Examples

```
gamma_site_model <- create_gamma_site_model()
n_distrs <- get_gamma_site_model_n_distrs(
  gamma_site_model
 )
testit::assert(n_distrs == 0)

gamma_site_model <- create_gamma_site_model(
  gamma_cat_count = 2,
  gamma_shape_prior_distr = create_exp_distr()
)
n_distrs <- get_gamma_site_model_n_distrs(gamma_site_model)
testit::assert(n_distrs == 1)
```

---

get_gamma_site_model_n_params

Get the number of distributions a site model has

Description

Get the number of distributions a site model has

Usage

```
get_gamma_site_model_n_params(gamma_site_model)
```

Arguments

`gamma_site_model`
: a site model's gamma site model, as returned by `create_gamma_site_model`

Value

the number of parameters a site model has

Author(s)

Richèl J.C. Bilderbeek

Examples

```
testit::assert(
  get_gamma_site_model_n_params(
    create_gamma_site_model(gamma_cat_count = 0)
  ) == 0
)
testit::assert(
  get_gamma_site_model_n_params(
    create_gamma_site_model(gamma_cat_count = 1)
```

```
  ) == 0
)
testit::assert(
  get_gamma_site_model_n_params(
    create_gamma_site_model(
      gamma_cat_count = 2,
      gamma_shape_prior_distr = create_exp_distr()
    )
  ) == 1
)
```

`get_has_non_strict_clock_model` *Determines if there is at least one non-strict clock model in the list of one or more clock models*

Description

Determines if there is at least one non-strict clock model in the list of one or more clock models

Usage

```
get_has_non_strict_clock_model(clock_models)
```

Arguments

`clock_models`	a list of one or more clock models, as returned by `create_clock_model`

Value

TRUE if there is at least one non-strict clock model

Author(s)

Richèl J.C. Bilderbeek

`get_inference_model_filenames` *Get the filenames stored in an inference model.*

Description

If there is no name for a `tipdates` file specified (as done by setting `inference_model$tipdates_filename` to NA, there will be one filename less returned

Usage

```
get_inference_model_filenames(inference_model)
```

Arguments

inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Examples

```
library(testthat)

inference_model <- create_inference_model()
inference_model$mcmc$tracelog$filename <- "/home/john/trace.log"
inference_model$mcmc$screenlog$filename <- "/home/john/screen.log"
inference_model$mcmc$treelog$filename <- "/home/john/tree.log"
inference_model$tipdates_filename <- "/home/john/tipdate.csv"

filenames <- get_inference_model_filenames(inference_model)

expect_equal(length(filenames), 4)
expect_true("/home/john/trace.log" %in% filenames)
expect_true("/home/john/screen.log" %in% filenames)
expect_true("/home/john/tree.log" %in% filenames)
expect_true("/home/john/tipdate.csv" %in% filenames)

#' Nope, no tip dates needed in my inference ...
inference_model$tipdates_filename <- NA
filenames <- get_inference_model_filenames(inference_model)

#' ... so one less file gets created
expect_equal(length(filenames), 3)
```

---

get_log_modes *Get the possible log modes*

Description

Get the possible log modes

Usage

```
get_log_modes()
```

get_log_sorts *Get the possible log sorts*

Description

Get the possible log sorts

Usage

```
get_log_sorts()
```

get_mcmc_filenames *Get the filenames stored in an MCMC.*

Description

If a filename is set to an empty string, to indicate a certain log file need not be created, this (non-)filename will not be returned.

Usage

```
get_mcmc_filenames(mcmc)
```

Arguments

mcmc	one MCMC. Use create_mcmc to create an MCMC. Use create_ns_mcmc to create an MCMC for a Nested Sampling run. Use check_mcmc to check if an MCMC is valid. Use rename_mcmc_filenames to rename the filenames in an MCMC.

Examples

```
library(testthat)

mcmc <- create_mcmc()
mcmc$tracelog$filename <- "/home/john/trace.log"
mcmc$screenlog$filename <- "/home/john/screen.log"
mcmc$treelog$filename <- "/home/john/tree.log"

filenames <- get_mcmc_filenames(mcmc)

expect_equal(length(filenames), 3)
expect_true("/home/john/trace.log" %in% filenames)
expect_true("/home/john/screen.log" %in% filenames)
expect_true("/home/john/tree.log" %in% filenames)

# If there is no need to write to the screenlog file ...
```

```
mcmc$screenlog$filename <- ""

# ... one file less will be created
filenames <- get_mcmc_filenames(mcmc)
expect_equal(length(filenames), 2)
```

`get_n_taxa` *Extract the number of taxa from a file*

Description

Extract the number of taxa from a file

Usage

```
get_n_taxa(filename)
```

Arguments

`filename`	name of a FASTA file

Value

the number of taxa

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

fasta_filename <- get_beautier_path("test_output_5.fas")
expect_equal(get_n_taxa(fasta_filename), 5)
```

get_operator_id_pre *Get the prefix of operator IDs*

Description

Get the prefix of operator IDs

Usage

```
get_operator_id_pre(tree_prior)
```

Arguments

tree_prior	a tree priors, as returned by create_tree_prior

Value

the prefix of operator IDs, similar to the name of a tree prior

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

bd_pre <- get_operator_id_pre(
  tree_prior = create_bd_tree_prior()
)
expect_equal(bd_pre, "BirthDeath")
```

get_param_names *Get the parameter names*

Description

Get the parameter names

Usage

```
get_param_names()
```

Value

the parameter names

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

names <- get_param_names()
expect_true("alpha" %in% names)
expect_true("beta" %in% names)
expect_true("clock_rate" %in% names)
expect_true("kappa_1" %in% names)
expect_true("kappa_2" %in% names)
expect_true("lambda" %in% names)
expect_true("m" %in% names)
expect_true("mean" %in% names)
expect_true("mu" %in% names)
expect_true("rate_ac" %in% names)
expect_true("rate_ag" %in% names)
expect_true("rate_at" %in% names)
expect_true("rate_cg" %in% names)
expect_true("rate_ct" %in% names)
expect_true("rate_gt" %in% names)
expect_true("s" %in% names)
expect_true("scale" %in% names)
expect_true("sigma" %in% names)
```

---

get_remove_dir_fun *Get a function that, from a filename, returns the part without the directory.*

Description

Or: get a function that returns the local version of a filename. Also, the function will return NA if the filename is NA

Usage

```
get_remove_dir_fun()
```

Author(s)

Richèl J.C. Bilderbeek

See Also

see check_rename_fun for an overview of file renaming functions

get_remove_hex_fun *Get a function that removes the hex string from filenames.*

Description

The default filenames created by beautier are temporary files, such as `/home/john/.cache/tracelog_82c5888db98.log` (on Linux), where `/home/john/.cache` is the location to a temporary folder (on Linux) and `tracelog_82c5888db98.log` the filename. The filename ends with a hex string (as is common for temporary files, as tempfile does so). Because beautier puts an underscore between the filename description (`tracelog`) and the hex string, this function removes both.

Usage

```
get_remove_hex_fun()
```

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

f <- get_remove_hex_fun()
expect_equal(
  f("/home/john/beast2_186c7404208c.xml.state"),
  "/home/john/beast2.xml.state"
)
expect_equal(
  f("beast2_186c7404208c.xml.state"),
  "beast2.xml.state"
)
expect_equal(f(NA), NA)
```

get_replace_dir_fun *Get a function to replace the directory of a filename*

Description

Get a function to replace the directory of a filename

Usage

```
get_replace_dir_fun(new_dir_name = "")
```

Arguments

`new_dir_name`	the new directory name

get_site_models_n_distrs

Get the number of distributions a site model has

Description

Get the number of distributions a site model has

Usage

```
get_site_models_n_distrs(site_models)
```

Arguments

site_models	one or more site models, as returned by create_site_model

Value

the number of distributions the site models have

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_equal(get_site_models_n_distrs(list(create_gtr_site_model())), 5)
expect_equal(get_site_models_n_distrs(list(create_hky_site_model())), 1)
expect_equal(get_site_models_n_distrs(list(create_jc69_site_model())), 0)
expect_equal(get_site_models_n_distrs(list(create_tn93_site_model())), 2)
```

get_site_models_n_params

Get the number of distributions one or more site models have

Description

Get the number of distributions one or more site models have

Usage

```
get_site_models_n_params(site_models)
```

Arguments

site_models	one or more site models, as returned by create_site_model

Value

the number of parameters the site models have

Author(s)

Richèl J.C. Bilderbeek

Examples

```
testit::assert(
  get_site_models_n_params(list(create_gtr_site_model())) == 10
)
testit::assert(
  get_site_models_n_params(list(create_hky_site_model())) == 2
)
testit::assert(
  get_site_models_n_params(list(create_jc69_site_model())) == 0
)
testit::assert(
  get_site_models_n_params(list(create_tn93_site_model())) == 4
)
```

---

get_site_model_names *Get the site models' names*

Description

Get the site models' names

Usage

```
get_site_model_names()
```

Value

the site model names

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_site_models to get all site models

Examples

```
# Check all names
names <- get_site_model_names()
testit::assert("JC69" %in% names)
testit::assert("HKY" %in% names)
testit::assert("TN93" %in% names)
testit::assert("GTR" %in% names)
```

`get_site_model_n_distrs` *Get the number of distributions a site model has*

Description

Get the number of distributions a site model has

Usage

```
get_site_model_n_distrs(site_model)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`

Value

the number of distributions a site model has

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

# gamma site model, rates AC, AG, AT, CG and GT
expect_equal(
  get_site_model_n_distrs(create_gtr_site_model()),
  5
)

# gamma site model, kappa
expect_equal(
  get_site_model_n_distrs(create_hky_site_model()),
  1
)

# gamma site model
```

```
expect_equal(
  get_site_model_n_distrs(create_jc69_site_model()),
  0
)

# gamma site model, kappa 1 and kappa 2
expect_equal(
  get_site_model_n_distrs(create_tn93_site_model()),
  2
)
```

`get_site_model_n_params` *Get the number of distributions a site model has*

Description

Get the number of distributions a site model has

Usage

```
get_site_model_n_params(site_model)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`

Value

the number of parameters a site model has

Author(s)

Richèl J.C. Bilderbeek

Examples

```
testit::assert(
  get_site_model_n_params(create_gtr_site_model()) == 10
)
testit::assert(
  get_site_model_n_params(create_hky_site_model()) == 2
)
testit::assert(
  get_site_model_n_params(create_jc69_site_model()) == 0
)
testit::assert(
  get_site_model_n_params(create_tn93_site_model()) == 4
)
```

get_taxa_names *Extract the names of taxa from a file*

Description

Extract the names of taxa from a file

Usage

```
get_taxa_names(filename)
```

Arguments

filename	name of a FASTA file

Value

the taxa names

Author(s)

Richèl J.C. Bilderbeek

Examples

```
created <- get_taxa_names(get_beautier_path("anthus_aco_sub.fas"))
expected <- c(
  "61430_aco", "626029_aco", "630116_aco", "630210_aco", "B25702_aco"
 )
testit::assert(created == expected)
```

get_tree_priors_n_distrs *Get the number of distributions a tree prior has*

Description

Get the number of distributions a tree prior has

Usage

```
get_tree_priors_n_distrs(tree_priors)
```

Arguments

tree_priors	one or more tree priors, as returned by create_tree_prior

Value

the number of distributions a tree prior has

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_equal(
  get_tree_priors_n_distrs(
    list(
      create_bd_tree_prior(), # has two distributions
      create_ccp_tree_prior() # has one distribution
    )
  ),
  3
)
```

---

get_tree_priors_n_params

Get the number of parameters a list of tree priors has

Description

Get the number of parameters a list of tree priors has

Usage

```
get_tree_priors_n_params(tree_priors)
```

Arguments

tree_priors	one or more tree priors, as returned by create_tree_prior

Value

the number of parameters the tree priors have

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_equal(
  get_tree_priors_n_params(
    list(
      create_bd_tree_prior(), # zero
      create_cep_tree_prior() # two
    )
  ),
  2
)
```

`get_tree_prior_names` *Get the tree prior names*

Description

Get the tree prior names

Usage

```
get_tree_prior_names()
```

Value

the tree prior names

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_tree_priors to get all tree priors

Examples

```
library(testthat)

names <- get_tree_prior_names()
expect_true("birth_death" %in% names)
expect_true("coalescent_bayesian_skyline" %in% names)
expect_true("coalescent_constant_population" %in% names)
expect_true("coalescent_exp_population" %in% names)
expect_true("yule" %in% names)
```

`get_tree_prior_n_distrs` *Get the number of distributions a tree prior has*

Description

Get the number of distributions a tree prior has

Usage

```
get_tree_prior_n_distrs(tree_prior)
```

Arguments

`tree_prior`	a tree priors, as returned by `create_tree_prior`

Value

the number of distributions a tree prior has

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

# birth_rate_distr and death_rate_distr
expect_equal(get_tree_prior_n_distrs(create_bd_tree_prior()), 2)

# none
expect_equal(get_tree_prior_n_distrs(create_cbs_tree_prior()), 0)

 # pop_size_distr
expect_equal(get_tree_prior_n_distrs(create_ccp_tree_prior()), 1)

 # pop_size_distr and growth_rate_distr
expect_equal(get_tree_prior_n_distrs(create_cep_tree_prior()), 2)

 # birth_rate_distr
expect_equal(get_tree_prior_n_distrs(create_yule_tree_prior()), 1)
```

`get_tree_prior_n_params` *Get the number of parameters a tree prior has*

Description

Get the number of parameters a tree prior has

Usage

```
get_tree_prior_n_params(tree_prior)
```

Arguments

`tree_prior`	a tree_prior, as created by `create_tree_prior`

Value

the number of parameters a tree prior has

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# birth_rate_distr is uniform, which has zero parameters
# death_rate_distr is uniform, which has zero parameters
testit::assert(
  get_tree_prior_n_params(create_bd_tree_prior()) == 0
)

# no distributions, no parameters
testit::assert(
  get_tree_prior_n_params(create_cbs_tree_prior()) == 0
)

# pop_size_distr is 1/x, which has zero parameters
testit::assert(
  get_tree_prior_n_params(create_ccp_tree_prior()) == 0
)

# pop_size_distr is 1/x, which has zero parameters
# growth_rate_distr is Laplace, which has two parameters
testit::assert(
  get_tree_prior_n_params(create_cep_tree_prior()) == 2
)

# birth_rate_distr is uniform, which has zero parameters
```

```
testit::assert(
  get_tree_prior_n_params(create_yule_tree_prior()) == 0
)
```

`get_xml_closing_tag` *Get the XML closing tag*

Description

Get the XML closing tag

Usage

```
get_xml_closing_tag(text)
```

Arguments

`text`	lines of XML to extract the XML closing tag from

Value

the closing tag if found, else NA

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_equal(
  get_xml_closing_tag("<my_tag text=something></my_tag>"),
  "my_tag"
)
expect_true(
  is_one_na(
    get_xml_closing_tag("<my_tag text=something/>")
  )
)
expect_true(is_one_na(get_xml_closing_tag("no_xml")))
```

get_xml_opening_tag *Get the XML opening tag*

Description

Get the XML opening tag

Usage

```
get_xml_opening_tag(text)
```

Arguments

text	text to be determined to be valid

Value

the opening tag if found, else NA

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_equal(
  get_xml_opening_tag("<my_tag text=something/>"),
  "my_tag"
)
expect_true(is_one_na(get_xml_opening_tag("no_xml")))
```

has_mrca_prior *Determines if the inference model has an MRCA prior.*

Description

Will stop if the inference model is invalid

Usage

```
has_mrca_prior(inference_model)
```

Arguments

`inference_model`
: a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Value

TRUE if the inference model has an MRCA prior, FALSE otherwise

Note

MRCA: 'Most Recent Common Ancestor'

Author(s)

Richèl J.C. Bilderbeek

See Also

- `create_inference_model`: create an inference model
- `create_mrca_prior`: create an MRCA prior

Examples

```
# No MRCA prior
inference_model <- create_inference_model(
  mrca_prior = NA
)
testthat::expect_false(has_mrca_prior(inference_model))

# A default MRCA prior
inference_model <- create_inference_model(
  mrca_prior = create_mrca_prior()
)
testthat::expect_true(has_mrca_prior(inference_model))
```

---

has_xml_closing_tag *Is an XML closing tag with the value of* `section` *present among the lines of the text?*

Description

Is an XML closing tag with the value of `section` present among the lines of the text?

Usage

```
has_xml_closing_tag(lines, section)
```

Arguments

lines	lines of the XML text
section	the XML section

Value

TRUE if there is an XML closing tag with the value of section present. FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

---

has_xml_opening_tag *Is an XML opening tag with value 'section' present among the lines of the text?*

Description

Is an XML opening tag with value 'section' present among the lines of the text?

Usage

```
has_xml_opening_tag(lines, section = NA)
```

Arguments

lines	lines of an XML text
section	if NA, this function returns TRUE if there is any XML opening tag. If section is set to a certain word, this function returns TRUE if that tag matches section

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

has_xml_short_closing_tag

Is an XML closing tag with short closing text in one of the lines of the text?

Description

Is an XML closing tag with short closing text in one of the lines of the text?

Usage

```
has_xml_short_closing_tag(lines)
```

Arguments

lines	lines of an XML text

Value

TRUE if there is an XML tag that also closes present in the lines of text, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(has_xml_short_closing_tag("<my_tag id=1/>"))
expect_false(has_xml_short_closing_tag("<my_tag id=1>text</my_tag>"))
```

indent

Indent text for a certain number of spaces. If the text is only whitespace, leave it as such

Description

Indent text for a certain number of spaces. If the text is only whitespace, leave it as such

Usage

```
indent(text, n_spaces = 4)
```

Arguments

text	the text to indent
n_spaces	the number of spaces to add before the text. BEAUti uses four spaces by default

Value

the indented text

Author(s)

Richèl J.C. Bilderbeek

---

init_bd_tree_prior *Initializes a Birth-Death tree prior*

Description

Initializes a Birth-Death tree prior

Usage

```
init_bd_tree_prior(bd_tree_prior, distr_id, param_id)
```

Arguments

bd_tree_prior	a Birth-Death tree prior, as created by create_bd_tree_prior
distr_id	a distributions' ID
param_id	a parameter's ID

Value

an initialized Birth-Death tree prior

Author(s)

Richèl J.C. Bilderbeek

init_beta_distr *Initializes a beta distribution*

Description

Initializes a beta distribution

Usage

```
init_beta_distr(beta_distr, distr_id = 0, param_id = 0)
```

Arguments

beta_distr	a beta distribution, using create_beta_distr
distr_id	the first distribution's ID
param_id	the first parameter's ID

Value

an initialized beta distribution

Author(s)

Richèl J.C. Bilderbeek

init_ccp_tree_prior *Initializes a Coalescent Constant Population tree prior*

Description

Initializes a Coalescent Constant Population tree prior

Usage

```
init_ccp_tree_prior(ccp_tree_prior, distr_id, param_id)
```

Arguments

ccp_tree_prior	a Coalescent Constant Population tree prior, as returned by create_ccp_tree_prior
distr_id	a distributions' ID
param_id	a parameter's ID

Value

an initialized Coalescent Constant Population tree prior

Author(s)

Richèl J.C. Bilderbeek

---

init_cep_tree_prior *Initializes a Coalescent Exponential Population tree prior*

Description

Initializes a Coalescent Exponential Population tree prior

Usage

```
init_cep_tree_prior(cep_tree_prior, distr_id, param_id)
```

Arguments

cep_tree_prior	a Coalescent Exponential Population tree prior, as returned by create_cep_tree_prior
distr_id	a distributions' ID
param_id	a parameter's ID

Value

an initialized Coalescent Exponential Population tree prior

Author(s)

Richèl J.C. Bilderbeek

---

init_clock_models *Initializes all clock models*

Description

Initializes all clock models

Usage

```
init_clock_models(fasta_filenames, clock_models, distr_id = 0, param_id = 0)
```

Arguments

fasta_filenames	One or more FASTA filenames. Use get_fasta_filename to obtain a testing FASTA filename.
clock_models	a list of one or more clock models, as returned by create_clock_model
distr_id	the first distributions' ID
param_id	the first parameter's ID

Value

a list of initialized clock models

Author(s)

Richèl J.C. Bilderbeek

---

init_distr *Initializes a distribution*

Description

Initializes a distribution

Usage

```
init_distr(distr, distr_id = 0, param_id = 0)
```

Arguments

distr	a distribution, using create_distr
distr_id	the first distribution's ID
param_id	the first parameter's ID

Value

an initialized distribution

Author(s)

Richèl J.C. Bilderbeek

---

init_exp_distr *Initializes an exponential distribution*

Description

Initializes an exponential distribution

Usage

```
init_exp_distr(exp_distr, distr_id = 0, param_id = 0)
```

Arguments

exp_distr	a exponential distribution, using create_exp_distr
distr_id	the first distribution's ID
param_id	the first parameter's ID

Value

an initialized exponential distribution

Author(s)

Richèl J.C. Bilderbeek

---

init_gamma_distr *Initializes a gamma distribution*

Description

Initializes a gamma distribution

Usage

```
init_gamma_distr(gamma_distr, distr_id = 0, param_id = 0)
```

Arguments

gamma_distr	a gamma distribution, using create_gamma_distr
distr_id	the first distribution's ID
param_id	the first parameter's ID

Value

an initialized gamma distribution

Author(s)

Richèl J.C. Bilderbeek

`init_gamma_site_model` *Initializes a gamma site model*

Description

Initializes a gamma site model

Usage

```
init_gamma_site_model(gamma_site_model, distr_id = 0, param_id = 0)
```

Arguments

`gamma_site_model`	a site model's gamma site model, as returned by `create_gamma_site_model`
`distr_id`	the first distributions' ID
`param_id`	the first parameter's ID

Value

an initialized gamma site model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

gamma_site_model <- create_gamma_site_model(
  gamma_cat_count = 2,
  gamma_shape_prior_distr = create_one_div_x_distr(id = NA)
)
expect_false(is_init_gamma_site_model(gamma_site_model))
gamma_site_model <- init_gamma_site_model(gamma_site_model)
expect_true(is_init_gamma_site_model(gamma_site_model))
```

init_gtr_site_model *Initializes a GTR site model*

Description

Initializes a GTR site model

Usage

```
init_gtr_site_model(gtr_site_model, distr_id = 0, param_id = 0)
```

Arguments

gtr_site_model	a GTR site model, as returned by create_gtr_site_model
distr_id	a distributions' ID
param_id	a parameter's ID

Value

an initialized GTR site model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
gtr_site_model <- create_gtr_site_model()
testit::assert(!is_init_gtr_site_model(gtr_site_model))
gtr_site_model <- init_gtr_site_model(gtr_site_model)
testit::assert(is_init_gtr_site_model(gtr_site_model))
```

init_hky_site_model *Initializes an HKY site model*

Description

Initializes an HKY site model

Usage

```
init_hky_site_model(hky_site_model, distr_id = 0, param_id = 0)
```

Arguments

hky_site_model	an HKY site model, as returned by create_hky_site_model
distr_id	a distributions' ID
param_id	a parameter's ID

Value

an initialized HKY site model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

hky_site_model <- create_hky_site_model()
expect_false(is_init_hky_site_model(hky_site_model))
hky_site_model <- init_hky_site_model(hky_site_model)
expect_true(is_init_hky_site_model(hky_site_model))
```

---

init_inference_model *Initialize an inference model*

Description

Initialize an inference model

Usage

```
init_inference_model(input_filename, inference_model)
```

Arguments

input_filename	A FASTA filename. Use get_fasta_filename to obtain a testing FASTA filename.
inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

init_inv_gamma_distr *Initializes an inverse gamma distribution*

Description

Initializes an inverse gamma distribution

Usage

```
init_inv_gamma_distr(inv_gamma_distr, distr_id = 0, param_id = 0)
```

Arguments

inv_gamma_distr	an inverse gamma distribution, using create_inv_gamma_distr
distr_id	the first distribution's ID
param_id	the first parameter's ID

Value

an initialized inverse gamma distribution

Author(s)

Richèl J.C. Bilderbeek

init_jc69_site_model *Initializes a JC69 site model*

Description

Initializes a JC69 site model

Usage

```
init_jc69_site_model(jc69_site_model, distr_id = 0, param_id = 0)
```

Arguments

jc69_site_model	a JC69 site model, as returned by create_jc69_site_model
distr_id	a distributions' ID
param_id	a parameter's ID

Value

an initialized HKY site model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

hky_site_model <- create_hky_site_model()
expect_false(is_init_hky_site_model(hky_site_model))
hky_site_model <- init_hky_site_model(hky_site_model)
expect_true(is_init_hky_site_model(hky_site_model))
```

---

init_laplace_distr *Initializes an Laplace distribution*

Description

Initializes an Laplace distribution

Usage

```
init_laplace_distr(laplace_distr, distr_id = 0, param_id = 0)
```

Arguments

laplace_distr	a Laplace distribution, using create_laplace_distr
distr_id	the first distribution's ID
param_id	the first parameter's ID

Value

an initialized Laplace distribution

Author(s)

Richèl J.C. Bilderbeek

init_log_normal_distr *Initializes an log-normal distribution*

Description

Initializes an log-normal distribution

Usage

```
init_log_normal_distr(log_normal_distr, distr_id = 0, param_id = 0)
```

Arguments

log_normal_distr	a log-normal distribution, using create_log_normal_distr
distr_id	the first distribution's ID
param_id	the first parameter's ID

Value

an initialized log-normal distribution

Author(s)

Richèl J.C. Bilderbeek

init_mrca_prior *Initialize the MRCA prior.*

Description

Initialized by

- if no alignment ID is set, it is set by reading it from the alignment file
- if no taxa names are set, these are set by reading these from the alignment file

Usage

```
init_mrca_prior(input_filename, inference_model)
```

Arguments

input_filename	A FASTA filename. Use get_fasta_filename to obtain a testing FASTA filename.
inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

---

init_mrca_priors *Initializes all MRCA priors*

Description

Initializes all MRCA priors

Usage

```
init_mrca_priors(mrca_priors, distr_id = 0, param_id = 0)
```

Arguments

mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior
distr_id	the first distributions' ID
param_id	the first parameter's ID

Value

a list of initialized MRCA priors

Author(s)

Richèl J.C. Bilderbeek

init_normal_distr *Initializes an normal distribution*

Description

Initializes an normal distribution

Usage

```
init_normal_distr(normal_distr, distr_id = 0, param_id = 0)
```

Arguments

normal_distr	a normal distribution, using create_normal_distr
distr_id	the first distribution's ID
param_id	the first parameter's ID

Value

an initialized normal distribution

Author(s)

Richèl J.C. Bilderbeek

init_one_div_x_distr *Initializes an one-divided-by-x distribution*

Description

Initializes an one-divided-by-x distribution

Usage

```
init_one_div_x_distr(one_div_x_distr, distr_id = 0)
```

Arguments

one_div_x_distr	a one-divided-by-x distribution, using create_one_div_x_distr
distr_id	the first distribution's ID

Value

an initialized one-divided-by-x distribution

Author(s)

Richèl J.C. Bilderbeek

`init_param` *Initializes a parameter*

Description

Initializes a parameter

Usage

```
init_param(param, id)
```

Arguments

`param`	a parameter, using `create_param`
`id`	the parameter's ID. Will be ignored if the parameter already has an ID

Value

an initialized parameter

Author(s)

Richèl J.C. Bilderbeek

`init_poisson_distr` *Initializes an Poisson distribution*

Description

Initializes an Poisson distribution

Usage

```
init_poisson_distr(poisson_distr, distr_id = 0, param_id = 0)
```

Arguments

`poisson_distr`	a Poisson distribution, using create_poisson_distr
`distr_id`	the first distribution's ID
`param_id`	the first parameter's ID

Value

an initialized Poisson distribution

Author(s)

Richèl J.C. Bilderbeek

`init_rln_clock_model` *Initializes a Relaxed Log-Normal clock model*

Description

Initializes a Relaxed Log-Normal clock model

Usage

```
init_rln_clock_model(rln_clock_model, distr_id = 0, param_id = 0)
```

Arguments

`rln_clock_model`	a Relaxed Log-Normal clock model, as returned by `create_rln_clock_model`
`distr_id`	a distributions' ID
`param_id`	a parameter's ID

Value

an initialized Relaxed Log-Normal clock model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

rln_clock_model <- create_rln_clock_model()
expect_false(is_init_rln_clock_model(rln_clock_model))
rln_clock_model <- init_rln_clock_model(rln_clock_model)
# Dimension is set to NA by default, for unknown reasons.
# Because 'init_rln_clock_model' does not initialize it (for
# unknown reasons), set it manually
rln_clock_model$dimension <- 42
expect_true(is_init_rln_clock_model(rln_clock_model))
```

init_site_models *Initializes all site models*

Description

Initializes all site models

Usage

```
init_site_models(site_models, ids, distr_id = 0, param_id = 0)
```

Arguments

site_models	one or more site models, as returned by create_site_model
ids	one or more alignments' IDs. IDs can be extracted from their FASTA filenames with get_alignment_ids_from_fasta_filenames)
distr_id	the first distributions' ID
param_id	the first parameter's ID

Value

a list of initialized site models

Author(s)

Richèl J.C. Bilderbeek

init_strict_clock_model *Initializes a strict clock model*

Description

Initializes a strict clock model

Usage

```
init_strict_clock_model(strict_clock_model, distr_id = 0, param_id = 0)
```

Arguments

strict_clock_model	a strict clock model, as returned by create_strict_clock_model
distr_id	a distributions' ID
param_id	a parameter's ID

Value

an initialized strict clock model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

strict_clock_model <- create_strict_clock_model()
expect_false(is_init_strict_clock_model(strict_clock_model))
strict_clock_model <- init_strict_clock_model(strict_clock_model)
expect_true(is_init_strict_clock_model(strict_clock_model))
```

---

init_tn93_site_model *Initializes a TN93 site model*

Description

Initializes a TN93 site model

Usage

```
init_tn93_site_model(tn93_site_model, distr_id = 0, param_id = 0)
```

Arguments

tn93_site_model	a TN93 site model, as returned by create_tn93_site_model
distr_id	a distributions' ID
param_id	a parameter's ID

Value

an initialized TN93 site model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

tn93_site_model <- create_tn93_site_model()
expect_false(is_init_tn93_site_model(tn93_site_model))
tn93_site_model <- init_tn93_site_model(tn93_site_model)
expect_true(is_init_tn93_site_model(tn93_site_model))
```

init_tree_priors *Initializes all tree priors*

Description

Initializes all tree priors

Usage

```
init_tree_priors(tree_priors, ids, distr_id = 0, param_id = 0)
```

Arguments

tree_priors	one or more tree priors, as returned by create_tree_prior
ids	one or more alignments' IDs. IDs can be extracted from their FASTA filenames with get_alignment_ids_from_fasta_filenames)
distr_id	the first distributions' ID
param_id	the first parameter's ID

Value

a list of initialized tree priors

Author(s)

Richèl J.C. Bilderbeek

init_uniform_distr *Initializes a uniform distribution*

Description

Initializes a uniform distribution

Usage

```
init_uniform_distr(uniform_distr, distr_id = 0)
```

Arguments

uniform_distr	a uniform distribution, using create_uniform_distr
distr_id	the first distribution's ID

Value

an initialized uniform distribution

Author(s)

Richèl J.C. Bilderbeek

`init_yule_tree_prior` *Initializes a Yule tree prior*

Description

Initializes a Yule tree prior

Usage

```
init_yule_tree_prior(yule_tree_prior, distr_id, param_id)
```

Arguments

`yule_tree_prior`	a Yule tree_prior, as created by `create_yule_tree_prior`
`distr_id`	a distributions' ID
`param_id`	a parameter's ID

Value

an initialized Yule tree prior

Author(s)

Richèl J.C. Bilderbeek

`interspace` *Puts spaces in between the lines*

Description

Puts spaces in between the lines

Usage

```
interspace(lines)
```

Arguments

`lines`	lines of text

Value

interspaced lines of text

Author(s)

Richèl J.C. Bilderbeek

`is_alpha_param` *Determine if the object is a valid alpha parameter*

Description

Determine if the object is a valid alpha parameter

Usage

```
is_alpha_param(x)
```

Arguments

`x`	an object, to be determined if it is a valid alpha parameter

Value

TRUE if x is a valid alpha parameter, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(is_alpha_param(create_alpha_param()))
expect_false(is_alpha_param(create_beta_param()))
expect_false(is_alpha_param(create_clock_rate_param()))
expect_false(is_alpha_param(create_kappa_1_param()))
expect_false(is_alpha_param(create_kappa_2_param()))
expect_false(is_alpha_param(create_lambda_param()))
expect_false(is_alpha_param(create_m_param()))
expect_false(is_alpha_param(create_mean_param()))
expect_false(is_alpha_param(create_mu_param()))
expect_false(is_alpha_param(create_rate_ac_param()))
expect_false(is_alpha_param(create_rate_ag_param()))
expect_false(is_alpha_param(create_rate_at_param()))
expect_false(is_alpha_param(create_rate_cg_param()))
expect_false(is_alpha_param(create_rate_ct_param()))
expect_false(is_alpha_param(create_rate_gt_param()))
```

```
expect_false(is_alpha_param(create_s_param()))
expect_false(is_alpha_param(create_scale_param()))
expect_false(is_alpha_param(create_sigma_param()))

expect_false(is_alpha_param(NA))
expect_false(is_alpha_param(NULL))
expect_false(is_alpha_param("nonsense"))
expect_false(is_alpha_param(create_jc69_site_model()))
expect_false(is_alpha_param(create_strict_clock_model()))
expect_false(is_alpha_param(create_yule_tree_prior()))
expect_false(is_alpha_param(create_mcmc()))
```

`is_bd_tree_prior` *Determine if the object is a valid Birth Death tree prior*

Description

Determine if the object is a valid Birth Death tree prior

Usage

```
is_bd_tree_prior(x)
```

Arguments

`x`	an object, to be determined if it is a valid birth death tree prior

Value

TRUE if x is a valid birth death tree prior, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

Use `create_bd_tree_prior` to create a valid Birth-Death tree prior

Examples

```
testit::assert(is_bd_tree_prior(create_bd_tree_prior()))
testit::assert(!is_bd_tree_prior(create_cbs_tree_prior()))
testit::assert(!is_bd_tree_prior(create_ccp_tree_prior()))
testit::assert(!is_bd_tree_prior(create_cep_tree_prior()))
testit::assert(!is_bd_tree_prior(create_yule_tree_prior()))
```

`is_beauti_options` *Determine if the object is a valid* `beauti_options`

Description

Determine if the object is a valid `beauti_options`

Usage

```
is_beauti_options(x)
```

Arguments

`x`	an object, to be determined if it is a `beauti_options`

Value

TRUE if the object is a valid `beauti_options`, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

use create_beauti_options to create a valid `beauti_options` object

Examples

```
library(testthat)

expect_true(is_beauti_options(create_beauti_options()))

expect_false(is_beauti_options("nonsense"))
expect_false(is_beauti_options(NA))
expect_false(is_beauti_options(NULL))
expect_false(is_beauti_options(""))
expect_false(is_beauti_options(c()))
```

`is_beta_distr` *Determine if the object is a valid beta distribution, as created by* `create_beta_distr`

Description

Determine if the object is a valid beta distribution, as created by `create_beta_distr`

Usage

```
is_beta_distr(x)
```

Arguments

`x`	an object, to be determined if it is a valid beta distribution,

Value

TRUE if x is a valid beta distribution, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

use `is_distr` to see if x is any distribution

Examples

```
library(testthat)

expect_true(is_beta_distr(create_beta_distr()))
expect_false(is_beta_distr(create_exp_distr()))

expect_false(is_beta_distr(NA))
expect_false(is_beta_distr(NULL))
expect_false(is_beta_distr("nonsense"))
```

`is_beta_param` *Determine if the object is a valid beta parameter*

Description

Determine if the object is a valid beta parameter

Usage

```
is_beta_param(x)
```

Arguments

`x`	an object, to be determined if it is a valid beta parameter

Value

TRUE if x is a valid beta parameter, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_false(is_beta_param(create_alpha_param()))
expect_true(is_beta_param(create_beta_param()))
expect_false(is_beta_param(create_clock_rate_param()))
expect_false(is_beta_param(create_kappa_1_param()))
expect_false(is_beta_param(create_kappa_2_param()))
expect_false(is_beta_param(create_lambda_param()))
expect_false(is_beta_param(create_m_param()))
expect_false(is_beta_param(create_mean_param()))
expect_false(is_beta_param(create_mu_param()))
expect_false(is_beta_param(create_rate_ac_param()))
expect_false(is_beta_param(create_rate_ag_param()))
expect_false(is_beta_param(create_rate_at_param()))
expect_false(is_beta_param(create_rate_cg_param()))
expect_false(is_beta_param(create_rate_ct_param()))
expect_false(is_beta_param(create_rate_gt_param()))
expect_false(is_beta_param(create_s_param()))
expect_false(is_beta_param(create_scale_param()))
expect_false(is_beta_param(create_sigma_param()))

expect_false(is_beta_param(NA))
expect_false(is_beta_param(NULL))
expect_false(is_beta_param("nonsense"))
expect_false(is_beta_param(create_jc69_site_model()))
```

```
expect_false(is_beta_param(create_strict_clock_model()))
expect_false(is_beta_param(create_yule_tree_prior()))
expect_false(is_beta_param(create_mcmc()))
```

`is_cbs_tree_prior` *Determine if the object is a valid constant coalescent Bayesian skyline prior*

Description

Determine if the object is a valid constant coalescent Bayesian skyline prior

Usage

```
is_cbs_tree_prior(x)
```

Arguments

`x`	an object, to be determined if it is a valid constant coalescent Bayesian skyline prior

Value

TRUE if x is a valid constant coalescent Bayesian skyline prior, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

Use `create_cbs_tree_prior` to create a valid coalescent Bayes skyline tree prior

Examples

```
testit::assert(!is_cbs_tree_prior(create_bd_tree_prior()))
testit::assert( is_cbs_tree_prior(create_cbs_tree_prior()))
testit::assert(!is_cbs_tree_prior(create_ccp_tree_prior()))
testit::assert(!is_cbs_tree_prior(create_cep_tree_prior()))
testit::assert(!is_cbs_tree_prior(create_yule_tree_prior()))
```

`is_ccp_tree_prior` *Determine if the object is a valid constant coalescence population tree prior*

Description

Determine if the object is a valid constant coalescence population tree prior

Usage

```
is_ccp_tree_prior(x)
```

Arguments

`x`	an object, to be determined if it is a valid constant coalescence population tree prior

Value

TRUE if x is a valid constant coalescence population tree prior, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

Use `create_ccp_tree_prior` to create a valid constant coalescence population tree prior

Examples

```
testit::assert(!is_ccp_tree_prior(create_bd_tree_prior()))
testit::assert(!is_ccp_tree_prior(create_cbs_tree_prior()))
testit::assert( is_ccp_tree_prior(create_ccp_tree_prior()))
testit::assert(!is_ccp_tree_prior(create_cep_tree_prior()))
testit::assert(!is_ccp_tree_prior(create_yule_tree_prior()))
```

`is_cep_tree_prior` *Determine if the object is a valid coalescent exponential population tree prior*

Description

Determine if the object is a valid coalescent exponential population tree prior

Usage

```
is_cep_tree_prior(x)
```

Arguments

`x`	an object, to be determined if it is a valid constant coalescent exponential population tree prior

Value

TRUE if x is a valid coalescent exponential population tree prior, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

Use `create_cep_tree_prior` to create a valid coalescent exponential population tree prior

Examples

```
testit::assert(!is_cep_tree_prior(create_bd_tree_prior()))
testit::assert(!is_cep_tree_prior(create_cbs_tree_prior()))
testit::assert(!is_cep_tree_prior(create_ccp_tree_prior()))
testit::assert( is_cep_tree_prior(create_cep_tree_prior()))
testit::assert(!is_cep_tree_prior(create_yule_tree_prior()))
```

`is_clock_model` *Determine if the object is a valid clock_model*

Description

Determine if the object is a valid clock_model

Usage

```
is_clock_model(x)
```

Arguments

`x`	an object, to be determined if it is a clock_model

Value

TRUE if the clock_model is a valid clock_model, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

see `create_clock_model` for an overview of functions to create valid clock model

Examples

```
library(testthat)

expect_true(is_clock_model(create_strict_clock_model()))
expect_true(is_clock_model(create_rln_clock_model()))

expect_false(is_clock_model(NA))
expect_false(is_clock_model(NULL))
expect_false(is_clock_model("nonsense"))
expect_false(is_clock_model(create_jc69_site_model()))
expect_false(is_clock_model(create_mcmc()))
```

is_clock_model_name *Determines if the name is a valid clock model name*

Description

Determines if the name is a valid clock model name

Usage

```
is_clock_model_name(name)
```

Arguments

name	the name to be tested

Value

TRUE if the name is a valid clock_model name, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(is_clock_model_name("relaxed_log_normal"))
expect_true(is_clock_model_name("strict"))
```

is_clock_rate_param *Determine if the object is a valid clock_rate parameter*

Description

Determine if the object is a valid clock_rate parameter

Usage

```
is_clock_rate_param(x)
```

Arguments

x	an object, to be determined if it is a valid clock_rate parameter

Value

TRUE if x is a valid clock_rate parameter, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_false(is_clock_rate_param(create_alpha_param()))
expect_false(is_clock_rate_param(create_beta_param()))
expect_true(is_clock_rate_param(create_clock_rate_param()))
expect_false(is_clock_rate_param(create_kappa_1_param()))
expect_false(is_clock_rate_param(create_kappa_2_param()))
expect_false(is_clock_rate_param(create_lambda_param()))
expect_false(is_clock_rate_param(create_m_param()))
expect_false(is_clock_rate_param(create_mean_param()))
expect_false(is_clock_rate_param(create_mu_param()))
expect_false(is_clock_rate_param(create_rate_ac_param()))
expect_false(is_clock_rate_param(create_rate_ag_param()))
expect_false(is_clock_rate_param(create_rate_at_param()))
expect_false(is_clock_rate_param(create_rate_cg_param()))
expect_false(is_clock_rate_param(create_rate_ct_param()))
expect_false(is_clock_rate_param(create_rate_gt_param()))
expect_false(is_clock_rate_param(create_s_param()))
expect_false(is_clock_rate_param(create_scale_param()))
expect_false(is_clock_rate_param(create_sigma_param()))

expect_false(is_clock_rate_param(NA))
expect_false(is_clock_rate_param(NULL))
expect_false(is_clock_rate_param("nonsense"))
expect_false(is_clock_rate_param(create_jc69_site_model()))
expect_false(is_clock_rate_param(create_strict_clock_model()))
expect_false(is_clock_rate_param(create_yule_tree_prior()))
expect_false(is_clock_rate_param(create_mcmc()))
```

---

is_default_mcmc *Determine if the MCMC is a default MCMC*

Description

Determine if the MCMC is a default MCMC

Usage

```
is_default_mcmc(mcmc)
```

Arguments

mcmc	one MCMC. Use create_mcmc to create an MCMC. Use create_ns_mcmc to create an MCMC for a Nested Sampling run. Use check_mcmc to check if an MCMC is valid. Use rename_mcmc_filenames to rename the filenames in an MCMC.

Value

TRUE if the MCMC is a default MCMC

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

# An MCMC created by 'create_mcmc' is default
expect_true(is_default_mcmc(create_mcmc()))

# An MCMC created by 'create_ns_mcmc' is not
expect_false(is_default_mcmc(create_ns_mcmc()))
```

---

is_distr *Determine if the object is a valid distribution*

Description

Determine if the object is a valid distribution

Usage

```
is_distr(x)
```

Arguments

x	an object, to be determined if it is a valid distribution

Value

TRUE if x is a valid distribution, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

use is_beta_distr, is_exp_distr, is_gamma_distr, is_inv_gamma_distr, is_laplace_distr, is_log_normal_distr, is_normal_distr, is_one_div_x_distr, is_poisson_distr, or is_uniform_distr, to check for more specific distribution

Examples

```
library(testthat)

expect_true(is_distr(create_beta_distr()))
expect_true(is_distr(create_exp_distr()))
expect_true(is_distr(create_gamma_distr()))
expect_true(is_distr(create_inv_gamma_distr()))
expect_true(is_distr(create_laplace_distr()))
expect_true(is_distr(create_log_normal_distr()))
expect_true(is_distr(create_normal_distr()))
expect_true(is_distr(create_one_div_x_distr()))
expect_true(is_distr(create_poisson_distr()))
expect_true(is_distr(create_uniform_distr()))

expect_false(is_distr(NA))
expect_false(is_distr(NULL))
expect_false(is_distr("nonsense"))
```

---

is_distr_name *Determines if the name is a valid distribution name*

Description

Determines if the name is a valid distribution name

Usage

```
is_distr_name(name)
```

Arguments

name	the name to be tested

Value

TRUE if the name is a valid distribution name, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(is_distr_name("uniform"))
expect_true(is_distr_name("normal"))
expect_true(is_distr_name("one_div_x"))
expect_true(is_distr_name("log_normal"))
expect_true(is_distr_name("exponential"))
expect_true(is_distr_name("gamma"))
expect_true(is_distr_name("beta"))
expect_true(is_distr_name("laplace"))
expect_true(is_distr_name("inv_gamma"))
expect_true(is_distr_name("poisson"))
```

`is_exp_distr` *Determine if the object is a valid exponential distribution as created by* `create_exp_distr`

Description

Determine if the object is a valid exponential distribution as created by `create_exp_distr`

Usage

```
is_exp_distr(x)
```

Arguments

`x`	an object, to be determined if it is a valid exponential distribution

Value

TRUE if x is a valid exponential distribution, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

use `is_distr` to see if x is any distribution

Examples

```
library(testthat)

expect_true(is_exp_distr(create_exp_distr()))
expect_false(is_exp_distr(create_gamma_distr()))
expect_false(is_exp_distr(NA))
expect_false(is_exp_distr(NULL))
expect_false(is_exp_distr("nonsense"))
```

---

is_freq_equilibrium_name

Checks if name *is a valid* freq_equilibrium *argument value*

Description

Checks if name is a valid freq_equilibrium argument value

Usage

```
is_freq_equilibrium_name(name)
```

Arguments

name	the name to check if it is a valid freq_equilibrium argument value

Value

TRUE if the name is a valid freq_equilibrium value

Author(s)

Richèl J.C. Bilderbeek

See Also

the freq_equilibrium argument is used by create_gtr_site_model, create_hky_site_model, and create_tn93_site_model

Examples

```
library(testthat)

expect_true(is_freq_equilibrium_name("estimated"))
expect_true(is_freq_equilibrium_name("empirical"))
expect_true(is_freq_equilibrium_name("all_equal"))
```

`is_gamma_distr` *Determine if the object is a valid gamma distribution, as created by* `create_gamma_distr`

Description

Determine if the object is a valid gamma distribution, as created by `create_gamma_distr`

Usage

```
is_gamma_distr(x)
```

Arguments

x	an object, to be determined if it is a valid gamma distribution

Value

TRUE if x is a valid gamma distribution, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

use `is_distr` to see if x is any distribution

Examples

```
library(testthat)

expect_true(is_gamma_distr(create_gamma_distr()))

expect_false(is_gamma_distr(create_inv_gamma_distr()))
expect_false(is_gamma_distr(NA))
expect_false(is_gamma_distr(NULL))
expect_false(is_gamma_distr("nonsense"))
```

is_gamma_site_model *Is object x a gamma site model?*

Description

Is object x a gamma site model?

Usage

```
is_gamma_site_model(x)
```

Arguments

x	the object to be determined if it is a valid gamma site object

Value

TRUE if x is a valid gamma site object, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(is_gamma_site_model(create_gamma_site_model()))

expect_false(is_gamma_site_model("nonsense"))
expect_false(is_gamma_site_model(NA))
expect_false(is_gamma_site_model(NULL))
expect_false(is_gamma_site_model(""))
expect_false(is_gamma_site_model(c()))
```

is_gtr_site_model *Determine if the object is a valid GTR site model, as created by* create_gtr_site_model

Description

Determine if the object is a valid GTR site model, as created by create_gtr_site_model

Usage

```
is_gtr_site_model(x)
```

Arguments

x	an object, to be determined if it is a valid GTR site model

Value

TRUE if x is a valid GTR site model, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

# site models
expect_true(is_gtr_site_model(create_gtr_site_model()))
expect_false(is_gtr_site_model(create_hky_site_model()))
expect_false(is_gtr_site_model(create_jc69_site_model()))
expect_false(is_gtr_site_model(create_tn93_site_model()))

# other models
expect_false(is_gtr_site_model(NA))
expect_false(is_gtr_site_model(NULL))
expect_false(is_gtr_site_model("nonsense"))
expect_false(is_gtr_site_model(create_strict_clock_model()))
expect_false(is_gtr_site_model(create_bd_tree_prior()))
expect_false(is_gtr_site_model(create_mcmc()))
```

---

is_hky_site_model *Determine if the object is a valid HKY site model, as created by* create_hky_site_model

---

Description

Determine if the object is a valid HKY site model, as created by create_hky_site_model

Usage

```
is_hky_site_model(x)
```

Arguments

x	an object, to be determined if it is a valid HKY site model

Value

TRUE if x is a valid HKY site model, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

# site models
expect_true(is_hky_site_model(create_hky_site_model()))
expect_false(is_hky_site_model(create_gtr_site_model()))
expect_false(is_hky_site_model(create_jc69_site_model()))
expect_false(is_hky_site_model(create_tn93_site_model()))

# other models
expect_false(is_hky_site_model(NA))
expect_false(is_hky_site_model(NULL))
expect_false(is_hky_site_model("nonsense"))
expect_false(is_hky_site_model(create_strict_clock_model()))
expect_false(is_hky_site_model(create_bd_tree_prior()))
expect_false(is_hky_site_model(create_mcmc()))
```

---

is_id *Determine if the object is a valid ID*

Description

Determine if the object is a valid ID

Usage

```
is_id(x)
```

Arguments

x	an object, to be determined if it is a valid ID

Value

TRUE if x is a valid ID, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

to check multiple IDs, use are_ids

Examples

```
library(testthat)

expect_true(is_id("anthus_aco"))
expect_true(is_id(3))
expect_false(is_id(ape::rcoal(3)))
expect_false(is_id(NULL))
expect_false(is_id(NA))
```

---

is_inference_model *Determine if the input is an inference model*

Description

Determine if the input is an inference model

Usage

```
is_inference_model(x)
```

Arguments

x	object to be determined of if it is an inference model

Value

TRUE if the object is an inference model

---

is_init_bd_tree_prior *Determine if x is an initialized Birth-Death tree_prior object*

Description

Determine if x is an initialized Birth-Death tree_prior object

Usage

```
is_init_bd_tree_prior(x)
```

Arguments

x	the object to check if it is an initialized Birth-Death tree prior object

Value

TRUE if x is an initialized Birth-Death tree_prior object

Author(s)

Richèl J.C. Bilderbeek

`is_init_beta_distr` *Determine if x is an initialized beta distribution object as created by* `create_beta_distr`

Description

Determine if x is an initialized beta distribution object as created by `create_beta_distr`

Usage

```
is_init_beta_distr(x)
```

Arguments

`x`	the object to check if it is an initialized beta distribution object

Value

TRUE if x is an initialized beta distribution object

Author(s)

Richèl J.C. Bilderbeek

`is_init_cbs_tree_prior` *Determine if x is an initialized Coalescent Bayesian Skyline tree_prior object*

Description

Determine if x is an initialized Coalescent Bayesian Skyline tree_prior object

Usage

```
is_init_cbs_tree_prior(x)
```

Arguments

`x`	the object to check if it is an initialized Coalescent Bayesian Skyline tree prior object

Value

TRUE if x is an initialized Coalescent Bayesian Skyline tree prior object

Author(s)

Richèl J.C. Bilderbeek

---

is_init_ccp_tree_prior

Determine if x is an initialized Coalescent Constant Population tree_prior object

---

Description

Determine if x is an initialized Coalescent Constant Population tree_prior object

Usage

```
is_init_ccp_tree_prior(x)
```

Arguments

x	the object to check if it is an initialized Coalescent Constant Population tree prior object

Value

TRUE if x is an initialized Coalescent Constant Population tree prior object

Author(s)

Richèl J.C. Bilderbeek

---

is_init_cep_tree_prior

Determine if x is an initialized Coalescent Exponential Population tree_prior object

---

Description

Determine if x is an initialized Coalescent Exponential Population tree_prior object

Usage

```
is_init_cep_tree_prior(x)
```

Arguments

x	the object to check if it is an initialized Coalescent Exponential Population tree prior object

Value

TRUE if x is an initialized Coalescent Exponential Population tree prior object

Author(s)

Richèl J.C. Bilderbeek

---

is_init_clock_model *Determine if x is an initialized clock_model object, as created by* create_clock_model

---

Description

Determine if x is an initialized clock_model object, as created by create_clock_model

Usage

```
is_init_clock_model(x)
```

Arguments

x	the object to check if it is an initialized clock_models object

Value

TRUE if x is an initialized clock_model object

Author(s)

Richèl J.C. Bilderbeek

is_init_distr — *Determine if x is an initialized distribution object as created by* create_distr

Description

Determine if x is an initialized distribution object as created by create_distr

Usage

```
is_init_distr(x)
```

Arguments

x	the object to check if it is an initialized distribution object

Value

TRUE if x is an initialized distribution object

Author(s)

Richèl J.C. Bilderbeek

is_init_exp_distr — *Determine if x is an initialized exponential distribution object as created by* create_exp_distr

Description

Determine if x is an initialized exponential distribution object as created by create_exp_distr

Usage

```
is_init_exp_distr(x)
```

Arguments

x	the object to check if it is an initialized exponential distribution object

Value

TRUE if x is an initialized exponential distribution object

Author(s)

Richèl J.C. Bilderbeek

is_init_gamma_distr *Determine if x is an initialized gamma distribution object*

Description

Determine if x is an initialized gamma distribution object

Usage

```
is_init_gamma_distr(x)
```

Arguments

x	the object to check if it is an initialized gamma distribution object

Value

TRUE if x is an initialized gamma distribution object

Author(s)

Richèl J.C. Bilderbeek

is_init_gamma_site_model *Determine if x is an initialized gamma site model, as created by* create_gamma_site_model

Description

Determine if x is an initialized gamma site model, as created by create_gamma_site_model

Usage

```
is_init_gamma_site_model(x)
```

Arguments

x	the object to check if it is an initialized gamma site_models object

Value

TRUE if x is an initialized gamma site model

Author(s)

Richèl J.C. Bilderbeek

is_init_gtr_site_model

Determine if x is an initialized GTR site model as created by `create_gtr_site_model`

Description

Determine if x is an initialized GTR site model as created by `create_gtr_site_model`

Usage

```
is_init_gtr_site_model(x)
```

Arguments

x	the object to check if it is an initialized GTR site model

Value

TRUE if x is an initialized GTR site model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

gtr_site_model <- create_gtr_site_model()
expect_false(is_init_gtr_site_model(gtr_site_model))
gtr_site_model <- init_gtr_site_model(gtr_site_model)
expect_true(is_init_gtr_site_model(gtr_site_model))
```

is_init_hky_site_model

Determine if x is an initialized HKY site model as created by `create_hky_site_model`

Description

Determine if x is an initialized HKY site model as created by `create_hky_site_model`

Usage

```
is_init_hky_site_model(x)
```

Arguments

x	the object to check if it is an initialized HKY site model

Value

TRUE if x is an initialized HKY site model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

hky_site_model <- create_hky_site_model()
expect_false(is_init_hky_site_model(hky_site_model))
hky_site_model <- init_hky_site_model(hky_site_model)
expect_true(is_init_hky_site_model(hky_site_model))
```

---

is_init_inv_gamma_distr

Determine if x is an initialized inverse-gamma distribution as created by create_inv_gamma_distr

---

Description

Determine if x is an initialized inverse-gamma distribution as created by create_inv_gamma_distr

Usage

```
is_init_inv_gamma_distr(x)
```

Arguments

x	the object to check if it is an initialized inverse-gamma distribution

Value

TRUE if x is an initialized inverse-gamma distribution

Author(s)

Richèl J.C. Bilderbeek

`is_init_jc69_site_model` *Determine if x is an initialized JC69 site model as created by* `create_jc69_site_model`

Description

Determine if x is an initialized JC69 site model as created by `create_jc69_site_model`

Usage

```
is_init_jc69_site_model(x)
```

Arguments

`x`	the object to check if it is an initialized JC69 site model

Value

TRUE if x is an initialized JC69 site model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

jc69_site_model <- create_jc69_site_model(
  gamma_site_model = create_gamma_site_model(
    gamma_cat_count = 2,
    gamma_shape_prior_distr = create_normal_distr()
  )
)
expect_false(is_init_jc69_site_model(jc69_site_model))
jc69_site_model <- init_jc69_site_model(jc69_site_model)
expect_true(is_init_jc69_site_model(jc69_site_model))
```

is_init_laplace_distr *Determine if x is an initialized Laplace distribution as created by* create_laplace_distr

Description

Determine if x is an initialized Laplace distribution as created by create_laplace_distr

Usage

```
is_init_laplace_distr(x)
```

Arguments

x	the object to check if it is an initialized Laplace distribution

Value

TRUE if x is an initialized Laplace distribution

Author(s)

Richèl J.C. Bilderbeek

is_init_log_normal_distr *Determine if x is an initialized log_normal distribution object as created by* create_log_normal_distr

Description

Determine if x is an initialized log_normal distribution object as created by create_log_normal_distr

Usage

```
is_init_log_normal_distr(x)
```

Arguments

x	the object to check if it is an initialized log_normal distribution object

Value

TRUE if x is an initialized log_normal distribution object

Author(s)

Richèl J.C. Bilderbeek

is_init_mrca_prior *Determine if x is an initialized MRCA prior*

Description

Determine if x is an initialized MRCA prior

Usage

```
is_init_mrca_prior(x)
```

Arguments

x	the object to check if it is an initialized MRCA prior

Value

TRUE if x is an initialized MRCA prior

Author(s)

Richèl J.C. Bilderbeek

is_init_normal_distr *Determine if x is an initialized normal distribution object as created by* create_normal_distr

Description

Determine if x is an initialized normal distribution object as created by create_normal_distr

Usage

```
is_init_normal_distr(x)
```

Arguments

x	the object to check if it is an initialized normal distribution object

Value

TRUE if x is an initialized normal distribution object

Author(s)

Richèl J.C. Bilderbeek

is_init_one_div_x_distr

Determine if x is an initialized one_div_x distribution object as created by `create_one_div_x_distr`

Description

Determine if x is an initialized one_div_x distribution object as created by `create_one_div_x_distr`

Usage

```
is_init_one_div_x_distr(x)
```

Arguments

x	the object to check if it is an initialized one_div_x distribution object

Value

TRUE if x is an initialized one_div_x distribution object

Author(s)

Richèl J.C. Bilderbeek

is_init_param

Determine if x is an initialized parameter, as created by create_param

Description

Determine if x is an initialized parameter, as created by create_param

Usage

```
is_init_param(x)
```

Arguments

x	the object to check if it is an initialized parameter

Value

TRUE if x is an initialized parameter, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

is_init_poisson_distr *Determine if x is an initialized Poisson distribution object as created by* create_poisson_distr

Description

Determine if x is an initialized Poisson distribution object as created by create_poisson_distr

Usage

```
is_init_poisson_distr(x)
```

Arguments

x	the object to check if it is an initialized Poisson distribution object

Value

TRUE if x is an initialized Poisson distribution object

Author(s)

Richèl J.C. Bilderbeek

is_init_rln_clock_model *Determine if x is an initialized relaxed log-normal clock_model object*

Description

Determine if x is an initialized relaxed log-normal clock_model object

Usage

```
is_init_rln_clock_model(rln_clock_model)
```

Arguments

rln_clock_model	a Relaxed Log-Normal clock model, as returned by create_rln_clock_model

Value

TRUE if x is an initialized relaxed log-normal clock_model object, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

is_init_site_model *Determine if x is an initialized site model, as created by* create_site_model

Description

Determine if x is an initialized site model, as created by create_site_model

Usage

```
is_init_site_model(x)
```

Arguments

x	the object to check if it is an initialized site_models object

Value

TRUE if x is an initialized site model

Author(s)

Richèl J.C. Bilderbeek

is_init_strict_clock_model *Determine if x is an initialized strict clock_model object*

Description

Determine if x is an initialized strict clock_model object

Usage

```
is_init_strict_clock_model(strict_clock_model)
```

Arguments

strict_clock_model	a strict clock model, as returned by create_strict_clock_model

Value

TRUE if x is an initialized strict clock_model object

Author(s)

Richèl J.C. Bilderbeek

is_init_tn93_site_model

Determine if x is an initialized tn93 site model as created by `create_tn93_site_model`

Description

Determine if x is an initialized tn93 site model as created by `create_tn93_site_model`

Usage

```
is_init_tn93_site_model(x)
```

Arguments

x	the object to check if it is an initialized TN93 site model

Value

TRUE if x is an initialized TN93 site model

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

tn93_site_model <- create_tn93_site_model()
expect_false(is_init_tn93_site_model(tn93_site_model))
tn93_site_model <- init_tn93_site_model(tn93_site_model)
expect_true(is_init_tn93_site_model(tn93_site_model))
```

is_init_tree_prior

Determine if x is an initialized tree_prior objects

Description

Determine if x is an initialized tree_prior objects

Usage

```
is_init_tree_prior(x)
```

Arguments

x	the object to check if it is an initialized tree_priors object

Value

TRUE if x is an initialized tree_prior object

Author(s)

Richèl J.C. Bilderbeek

---

is_init_uniform_distr *Determine if x is an initialized uniform distribution object as created by* create_uniform_distr

---

Description

Determine if x is an initialized uniform distribution object as created by create_uniform_distr

Usage

```
is_init_uniform_distr(x)
```

Arguments

x	the object to check if it is an initialized uniform distribution object

Value

TRUE if x is an initialized uniform distribution object

Author(s)

Richèl J.C. Bilderbeek

is_init_yule_tree_prior *Determine if x is an initialized Yule tree_prior object*

Description

Determine if x is an initialized Yule tree_prior object

Usage

```
is_init_yule_tree_prior(x)
```

Arguments

x	the object to check if it is an initialized Yule tree prior object

Value

TRUE if x is an initialized Yule tree_prior object

Author(s)

Richèl J.C. Bilderbeek

is_inv_gamma_distr *Determine if the object is a valid inverse-gamma distribution as created by* create_inv_gamma_distr

Description

Determine if the object is a valid inverse-gamma distribution as created by create_inv_gamma_distr

Usage

```
is_inv_gamma_distr(x)
```

Arguments

x	an object, to be determined if it is a valid inverse-gamma distribution

Value

TRUE if x is a valid inverse-gamma distribution, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

use is_distr to see if x is any distribution

Examples

```
library(testthat)

expect_true(is_inv_gamma_distr(create_inv_gamma_distr()))

expect_false(is_inv_gamma_distr(create_laplace_distr()))
expect_false(is_inv_gamma_distr(NA))
expect_false(is_inv_gamma_distr(NULL))
expect_false(is_inv_gamma_distr("nonsense"))
```

---

is_in_patterns *Is there at least one regular expression having a match with the line?*

Description

Is there at least one regular expression having a match with the line?

Usage

```
is_in_patterns(line, patterns)
```

Arguments

line	a line of text
patterns	one or more regular expression patterns

Value

TRUE if there is at least one match found

Author(s)

Richèl J.C. Bilderbeek

`is_jc69_site_model` *Determine if the object is a valid JC69 site model*

Description

Determine if the object is a valid JC69 site model

Usage

```
is_jc69_site_model(x)
```

Arguments

x	an object, to be determined if it is a valid JC69 site model

Value

TRUE if x is a valid JC69 site model, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

# site models
expect_false(is_jc69_site_model(create_gtr_site_model()))
expect_false(is_jc69_site_model(create_hky_site_model()))
expect_true(is_jc69_site_model(create_jc69_site_model()))
expect_false(is_jc69_site_model(create_tn93_site_model()))

# other models
expect_false(is_jc69_site_model(NA))
expect_false(is_jc69_site_model(NULL))
expect_false(is_jc69_site_model("nonsense"))
expect_false(is_jc69_site_model(create_strict_clock_model()))
expect_false(is_jc69_site_model(create_bd_tree_prior()))
expect_false(is_jc69_site_model(create_mcmc()))
```

`is_kappa_1_param` *Determine if the object is a valid kappa 1 parameter*

Description

Determine if the object is a valid kappa 1 parameter

Usage

```
is_kappa_1_param(x)
```

Arguments

x	an object, to be determined if it is a valid kappa 1 parameter

Value

TRUE if x is a valid kappa 1 parameter, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

kappa 1 parameters are returned by `create_kappa_1_param`

Examples

```
library(testthat)

expect_false(is_kappa_1_param(create_alpha_param()))
expect_false(is_kappa_1_param(create_beta_param()))
expect_false(is_kappa_1_param(create_clock_rate_param()))
expect_true(is_kappa_1_param(create_kappa_1_param()))
expect_false(is_kappa_1_param(create_kappa_2_param()))
expect_false(is_kappa_1_param(create_lambda_param()))

`is_kappa_2_param` *Determine if the object is a valid kappa 2 parameter*

Description

Determine if the object is a valid kappa 2 parameter

Usage

```
is_kappa_2_param(x)
```

Arguments

`x`	an object, to be determined if it is a valid kappa 2 parameter

Value

TRUE if x is a valid kappa_2 parameter, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

kappa 2 parameters are returned by `create_kappa_2_param`

Examples

```
library(testthat)

expect_false(is_kappa_2_param(create_alpha_param()))
expect_false(is_kappa_2_param(create_beta_param()))

```

`is_mrca_align_ids_in_fastas` *Determine if an MRCA prior's alignment IDs are present in the FASTA files*

Description

Determine if an MRCA prior's alignment IDs are present in the FASTA files

Usage

```
is_mrca_align_ids_in_fastas(mrca_prior, fasta_filenames)
```

Arguments

`mrca_prior`	a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`
`fasta_filenames`	One or more FASTA filenames. Use `get_fasta_filename` to obtain a testing FASTA filename.

Value

TRUE if the MRCA prior's alignment IDs is present in the FASTA files. Returns FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

`is_mrca_align_id_in_fasta` *Determine if an MRCA prior's alignment IDs is present in the FASTA file*

Description

Determine if an MRCA prior's alignment IDs is present in the FASTA file

Usage

```
is_mrca_align_id_in_fasta(mrca_prior, fasta_filename)
```

Arguments

mrca_prior	a Most Recent Common Ancestor prior, as returned by create_mrca_prior
fasta_filename	a FASTA filename. Use get_fasta_filename to obtain a testing FASTA filename.

Value

TRUE if the MRCA prior's alignment IDs is present in the FASTA file. Returns FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

---

is_mrca_prior *Determine of the object is an empty (NA) or valid MRCA prior.*

Description

Determine of the object is an empty (NA) or valid MRCA prior.

Usage

```
is_mrca_prior(mrca_prior)
```

Arguments

mrca_prior	a Most Recent Common Ancestor prior, as returned by create_mrca_prior

Value

TRUE if x is an MRCA prior, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(is_mrca_prior(create_mrca_prior()))
# Also 'NA' is a valid MRCA prior,
# denoting that there no MRCA priors
expect_true(is_mrca_prior(NA))

expect_false(is_mrca_prior(NULL))
expect_false(is_mrca_prior("nonsense"))
```

is_mrca_prior_with_distr *See if x is one MRCA prior with a distribution*

Description

See if x is one MRCA prior with a distribution

Usage

```
is_mrca_prior_with_distr(x)
```

Arguments

x	the object to be tested

Value

TRUE if x is one MRCA prior with a distribution, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

is_mu_param *Determine if the object is a valid mu parameter*

Description

Determine if the object is a valid mu parameter

Usage

```
is_mu_param(x)
```

Arguments

x	an object, to be determined if it is a valid mu parameter

Value

TRUE if x is a valid mu parameter, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

create_mu_param creates a mu parameter

Examples

```
library(testthat)

expect_false(is_mu_param(create_alpha_param()))
expect_false(is_mu_param(create_beta_param()))

```

---

is_m_param *Determine if the object is a valid m parameter*

Description

Determine if the object is a valid m parameter

Usage

```
is_m_param(x)
```

Arguments

x	an object, to be determined if it is a valid m parameter

Value

TRUE if x is a valid m parameter, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_false(is_m_param(create_alpha_param()))
expect_false(is_m_param(create_beta_param()))
expect_false(is_m_param(create_clock_rate_param()))

expect_false(is_one_bool(is_one_bool))
expect_false(is_one_bool(c(TRUE, FALSE)))
```

---

is_one_div_x_distr *Determine if the object is a valid 1/x distribution, as created by* create_one_div_x_distr

---

Description

Determine if the object is a valid 1/x distribution, as created by create_one_div_x_distr

Usage

```
is_one_div_x_distr(x)
```

Arguments

x	an object, to be determined if it is a valid 1/x distribution

Value

TRUE if x is a valid 1/x distribution, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

use is_distr to see if x is any distribution

Examples

```
library(testthat)

expect_true(is_one_div_x_distr(create_one_div_x_distr()))

expect_false(is_one_div_x_distr(NA))
expect_false(is_one_div_x_distr(NULL))
expect_false(is_one_div_x_distr("nonsense"))
```

is_one_double *Determines if the argument is a double*

Description

Determines if the argument is a double

Usage

```
is_one_double(x)
```

Arguments

x	the object to be determined of if it is one double

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(is_one_double(314))
expect_true(is_one_double(0))
expect_true(is_one_double(-314))
expect_true(is_one_double(3.14))
expect_false(is_one_double(NULL))
expect_false(is_one_double(NA))
expect_false(is_one_double(Inf))
expect_false(is_one_double("nonsense"))
expect_false(is_one_double(is_one_double))
expect_false(is_one_double(c()))
expect_false(is_one_double(c(1, 2)))
```

is_one_int *Determines if the argument is a whole number*

Description

Determines if the argument is a whole number

Usage

```
is_one_int(x, tolerance = .Machine$double.eps^0.5)
```

Arguments

x	the object to be determined of if it is one integer
tolerance	tolerance to rounding errors

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(is_one_int(314))
expect_true(is_one_int(0))
expect_true(is_one_int(-314))
expect_false(is_one_int(3.14))
expect_false(is_one_int(NULL))
expect_false(is_one_int(NA))
expect_false(is_one_int(Inf))
expect_false(is_one_int("nonsense"))
expect_false(is_one_int(c()))
expect_false(is_one_int(c(1, 2)))
```

---

is_one_na *Determines if x is one NA*

Description

Determines if x is one NA

Usage

```
is_one_na(x)
```

Arguments

x	the object to be determined if it is one NA

Value

TRUE if x is one NA, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
testit::assert(is_one_na(NA))
testit::assert(!is_one_na(NULL))
testit::assert(!is_one_na(42))
testit::assert(!is_one_na("Hello"))
testit::assert(!is_one_na(3.14))
testit::assert(!is_one_na(c(NA, NA)))
```

`is_param` *Determine if the object is a valid parameter*

Description

Determine if the object is a valid parameter

Usage

```
is_param(x)
```

Arguments

x	an object, to be determined if it is a valid parameter, as created by `create_param`)

Value

TRUE if x is a valid parameter, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(is_param(create_alpha_param()))
expect_true(is_param(create_beta_param()))
expect_true(is_param(create_clock_rate_param()))
expect_true(is_param(create_kappa_1_param()))
expect_true(is_param(create_kappa_2_param()))
expect_true(is_param(create_lambda_param()))
expect_true(is_param(create_m_param()))
expect_true(is_param(create_mean_param()))
expect_true(is_param(create_mu_param()))
expect_true(is_param(create_rate_ac_param()))
expect_true(is_param(create_rate_ag_param()))
expect_true(is_param(create_rate_at_param()))
expect_true(is_param(create_rate_cg_param()))
expect_true(is_param(create_rate_ct_param()))
```

```
expect_true(is_param(create_rate_gt_param()))
expect_true(is_param(create_s_param()))
expect_true(is_param(create_scale_param()))
expect_true(is_param(create_sigma_param()))

expect_false(is_param(NA))
expect_false(is_param(NULL))
expect_false(is_param("nonsense"))
expect_false(is_param(create_jc69_site_model()))
expect_false(is_param(create_strict_clock_model()))
expect_false(is_param(create_yule_tree_prior()))
expect_false(is_param(create_mcmc()))
```

`is_param_name` *Determines if the name is a valid parameter name*

Description

Determines if the name is a valid parameter name

Usage

```
is_param_name(name)
```

Arguments

`name`	the name to be tested

Value

TRUE if the name is a valid parameter name, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(is_param_name("alpha"))
expect_true(is_param_name("beta"))
expect_true(is_param_name("clock_rate"))
expect_true(is_param_name("kappa_1"))
expect_true(is_param_name("kappa_2"))
expect_true(is_param_name("lambda"))
expect_true(is_param_name("m"))
expect_true(is_param_name("mean"))

expect_false(is_param_name(NULL))
expect_false(is_param_name(""))
expect_false(is_param_name(c()))
```

`is_phylo` *Checks if the input is a phylogeny*

Description

Checks if the input is a phylogeny

Usage

```
is_phylo(x)
```

Arguments

`x`	input to be checked

Value

TRUE or FALSE

Author(s)

Richèl J.C. Bilderbeek

See Also

Use check_phylogeny to check for a phylogeny

Examples

```
phylogeny <- ape::read.tree(text = "(a:15,b:15):1;")
testit::assert(is_phylo(phylogeny))

testit::assert(!is_phylo("nonsense"))
testit::assert(!is_phylo(NA))
testit::assert(!is_phylo(NULL))
```

`is_poisson_distr` *Determine if the object is a valid Poisson distribution as created by* `create_poisson_distr`

Description

Determine if the object is a valid Poisson distribution as created by `create_poisson_distr`

Usage

```
is_poisson_distr(x)
```

Arguments

x	an object, to be determined if it is a valid Poisson distribution

Value

TRUE if x is a valid Poisson distribution, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

use `is_distr` to see if x is any distribution

Examples

```
library(testthat)

`is_rate_ac_param` *Determine if the object is a valid 'rate AC' parameter*

Description

Determine if the object is a valid 'rate AC' parameter

Usage

```
is_rate_ac_param(x)
```

Arguments

x	an object, to be determined if it is a valid 'rate AC' parameter

Value

TRUE if x is a valid 'rate AC' parameter, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

`create_rate_ac_param` creates a 'rate AC' parameter

Examples

```
library(testthat)

expect_false(is_s_param(create_mcmc()))
```

---

is_tn93_site_model *Determine if the object is a valid TN93 site model,*

Description

Determine if the object is a valid TN93 site model,

Usage

```
is_tn93_site_model(x)
```

Arguments

x	an object, to be determined if it is a valid TN93 site model, as created by create_tn93_site_model

Value

TRUE if x is a valid TN93 site model, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

# site models
expect_false(is_tn93_site_model(create_gtr_site_model()))
expect_false(is_tn93_site_model(create_hky_site_model()))

expect_false(is_tn93_site_model(create_bd_tree_prior()))
expect_false(is_tn93_site_model(create_mcmc()))
```

---

is_tree_prior *Determine if an object is a valid tree prior*

Description

Determine if an object is a valid tree prior

Usage

```
is_tree_prior(x)
```

Arguments

x	an object

Value

TRUE if x is a valid tree_prior, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

tree priors can be created by `create_tree_prior`

Examples

```
testit::assert(is_tree_prior(create_bd_tree_prior()))
testit::assert(is_tree_prior(create_yule_tree_prior()))
testit::assert(!is_tree_prior("nonsense"))
```

---

is_tree_prior_name *Determines if the name is a valid tree prior name*

Description

Determines if the name is a valid tree prior name

Usage

```
is_tree_prior_name(name)
```

Arguments

`name`	the name to be tested

Value

TRUE if the name is a valid tree_prior name, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

expect_true(is_tree_prior_name("birth_death"))
expect_true(is_tree_prior_name("coalescent_bayesian_skyline"))
expect_true(is_tree_prior_name("coalescent_constant_population"))
expect_true(is_tree_prior_name("coalescent_exp_population"))
expect_true(is_tree_prior_name("yule"))
```

`is_uniform_distr` *Determine if the object is a valid uniform distribution as created by* `create_uniform_distr`

Description

Determine if the object is a valid uniform distribution as created by `create_uniform_distr`

Usage

```
is_uniform_distr(x)
```

Arguments

x	an object, to be determined if it is a valid uniform distribution

Value

TRUE if x is a valid uniform distribution, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

use `is_distr` to see if x is any distribution

Examples

```
library(testthat)

expect_true(is_uniform_distr(create_uniform_distr()))
expect_false(is_uniform_distr(create_beta_distr()))

expect_false(is_uniform_distr(NA))
expect_false(is_uniform_distr(NULL))
expect_false(is_uniform_distr("nonsense"))
```

`is_xml` *Checks if the text is a valid XML node, that is, it has a opening and matching closing tag*

Description

Checks if the text is a valid XML node, that is, it has a opening and matching closing tag

Usage

```
is_xml(text)
```

Arguments

`text`	text to be determined to be valid

Value

TRUE if the text is valid XML, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

`is_yule_tree_prior` *Determine if the object is a valid Yule tree prior,*

Description

Determine if the object is a valid Yule tree prior,

Usage

```
is_yule_tree_prior(x)
```

Arguments

`x`	an object, to be determined if it is a valid Yule tree prior

Value

TRUE if x is a valid Yule tree prior, FALSE otherwise

Author(s)

Richèl J.C. Bilderbeek

See Also

Use create_yule_tree_prior to create a valid Yule tree prior

Examples

```
testit::assert(!is_yule_tree_prior(create_bd_tree_prior()))
testit::assert(!is_yule_tree_prior(create_cbs_tree_prior()))
testit::assert(!is_yule_tree_prior(create_ccp_tree_prior()))
testit::assert(!is_yule_tree_prior(create_cep_tree_prior()))
testit::assert( is_yule_tree_prior(create_yule_tree_prior()))
```

---

mcmc_to_xml_run *Converts an MCMC object to the run section's XML*

Description

Converts an MCMC object to the run section's XML

Usage

```
mcmc_to_xml_run(mcmc)
```

Arguments

mcmc	one MCMC. Use create_mcmc to create an MCMC. Use create_ns_mcmc to create an MCMC for a Nested Sampling run. Use check_mcmc to check if an MCMC is valid. Use rename_mcmc_filenames to rename the filenames in an MCMC.

Value

the XML as text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

xml <- mcmc_to_xml_run(create_mcmc())
expect_equal(
  xml,
  "<run id=\"mcmc\" spec=\"MCMC\" chainLength=\"1e+07\">"
)
```

`mcmc_to_xml_run_default` *Converts an MCMC object to the run section's XML for a default MCMC*

Description

Converts an MCMC object to the run section's XML for a default MCMC

Usage

```
mcmc_to_xml_run_default(mcmc)
```

Arguments

`mcmc`	one MCMC. Use `create_mcmc` to create an MCMC. Use `create_ns_mcmc` to create an MCMC for a Nested Sampling run. Use `check_mcmc` to check if an MCMC is valid. Use `rename_mcmc_filenames` to rename the filenames in an MCMC.

Value

the XML as text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

xml <- mcmc_to_xml_run_default(create_mcmc())

expect_equal(
  xml,
  "<run id=\"mcmc\" spec=\"MCMC\" chainLength=\"1e+07\">"
)
```

`mcmc_to_xml_run_nested_sampling` *Converts an MCMC object to the run section's XML for a Nested-Sampling MCMC*

Description

Converts an MCMC object to the run section's XML for a Nested-Sampling MCMC

Usage

```
mcmc_to_xml_run_nested_sampling(mcmc)
```

Arguments

`mcmc`	one MCMC. Use `create_mcmc` to create an MCMC. Use `create_ns_mcmc` to create an MCMC for a Nested Sampling run. Use `check_mcmc` to check if an MCMC is valid. Use `rename_mcmc_filenames` to rename the filenames in an MCMC.

Value

the XML as text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

xml <- mcmc_to_xml_run_nested_sampling(
  create_ns_mcmc()
)

expect_equal(
  xml,
  paste0(
    "<run id=\"mcmc\" spec=\"beast.gss.NS\" chainLength=\"1e+07\" ",
    "particleCount=\"1\" subChainLength=\"5000\" epsilon=\"1e-12\">"
  )
)
```

mrca_priors_to_xml_prior_distr
Creates the the distribution*'s prior section (which is part of a posterior distribution section) of a BEAST2 XML parameter file.*

Description

These lines start with '<distribution id="prior"'

Usage

```
mrca_priors_to_xml_prior_distr(mrca_priors, has_non_strict_clock_model)
```

Arguments

mrca_priors	a list of one or more Most Recent Common Ancestor priors, as returned by create_mrca_prior
has_non_strict_clock_model	boolean to indicate that the is already at least one non-strict (i.e. relaxed log-normal) clock model

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

`mrca_priors_to_xml_state` *Converts one or more MRCA priors to the* `state` *section of the XML as text*

Description

Converts one or more MRCA priors to the `state` section of the XML as text

Usage

```
mrca_priors_to_xml_state(
  inference_model,
  mrca_priors = "deprecated",
  has_non_strict_clock_model = "deprecated"
)
```

Arguments

`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
`mrca_priors`	a list of one or more Most Recent Common Ancestor priors, as returned by `create_mrca_prior`
`has_non_strict_clock_model`	boolean to indicate that the is already at least one non-strict (i.e. relaxed log-normal) clock model

Value

lines of XML text, without indentation nor `state` tags

Author(s)

Richèl J.C. Bilderbeek

`mrca_priors_to_xml_tracelog` *Creates the MRCA priors' XML for the tracelog section*

Description

Creates the MRCA priors' XML for the tracelog section

Usage

```
mrca_priors_to_xml_tracelog(clock_models, mrca_priors, tipdates_filename = NA)
```

Arguments

`clock_models`	a list of one or more clock models, as returned by `create_clock_model`
`mrca_priors`	a list of one or more Most Recent Common Ancestor priors, as returned by `create_mrca_prior`
`tipdates_filename`	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

See Also

the complete tracelog section is created by `create_tracelog_xml`

Examples

```
# <logger id="tracelog" ...>
#'   # Here
# </logger>
```

`mrca_prior_to_xml_lh_distr` *Converts an MRCA prior to the* `branchRateModel` *section of the XML as text.*

Description

This function will be called if and only if there are MRCA priors and only supports strict clocks at the moment.

Usage

```
mrca_prior_to_xml_lh_distr(
  inference_model,
  mrca_prior = "deprecated",
  has_non_strict_clock_model = "deprecated"
)
```

Arguments

`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
`mrca_prior`	a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`
`has_non_strict_clock_model`	boolean to indicate that the is already at least one non-strict (i.e. relaxed log-normal) clock model

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#     </distribution>
#     <distribution id="likelihood" ...>
#       HERE, where the ID of the distribution is 'likelihood'
#     </distribution>
# </distribution>
```

`mrca_prior_to_xml_prior_distr` *Creates the distribution section in the prior section of the distribution section of a BEAST2 XML parameter file.*

Description

These lines start with '<distribution id='

Usage

```
mrca_prior_to_xml_prior_distr(
  mrca_prior,
  has_non_strict_clock_model = FALSE,
  taxa_names_with_ids = NULL
)
```

Arguments

`mrca_prior`	a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`
`has_non_strict_clock_model`	boolean to indicate that the is already at least one non-strict (i.e. relaxed log-normal) clock model
`taxa_names_with_ids`	taxa names that already have received an ID. Causes the XML to `idref` these

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

`mrca_prior_to_xml_state` *Internal function to create the XML of an MRCA prior, as used in the* `state` *section*

Description

Internal function to create the XML of an MRCA prior, as used in the `state` section

Usage

```
mrca_prior_to_xml_state(
  inference_model,
  mrca_prior = "deprecated",
  has_non_strict_clock_model = "deprecated"
)
```

Arguments

`inference_model`
: a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

`mrca_prior`
: a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`

`has_non_strict_clock_model`
: boolean to indicate that the is already at least one non-strict (i.e. relaxed log-normal) clock model

Value

the tree prior as XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

created <- mrca_prior_to_xml_state(
  inference_model = create_inference_model(
    mrca_prior = create_mrca_prior(
      alignment_id = "test_output_0",
      mrca_distr = create_normal_distr(id = 42)
    ),
```

```
    clock_model = create_strict_clock_model()
  )
)
expect_match(created, "<parameter id=\"clockRate.c:")
```

`mrca_prior_to_xml_taxonset` *Creates the* `taxonset` *section in the prior section of the distribution section of a BEAST2 XML parameter file.*

Description

Creates the `taxonset` section in the prior section of the distribution section of a BEAST2 XML parameter file.

Usage

```
mrca_prior_to_xml_taxonset(mrca_prior, taxa_names_with_ids = NULL)
```

Arguments

`mrca_prior`	a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`
`taxa_names_with_ids`	taxa names that already have received an ID. Causes the XML to `idref` these

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <taxonset id="all" spec="TaxonSet">
#     <taxon id="626029_aco" spec="Taxon"/>
#     <taxon id="630116_aco" spec="Taxon"/>
#     <taxon id="630210_aco" spec="Taxon"/>
#     <taxon id="B25702_aco" spec="Taxon"/>
#     <taxon id="61430_aco" spec="Taxon"/>
# </taxonset>
```

`mrca_prior_to_xml_tracelog` *Creates the MRCA prior's XML for the tracelog section*

Description

Creates the MRCA prior's XML for the tracelog section

Usage

```
mrca_prior_to_xml_tracelog(clock_models, mrca_prior, tipdates_filename = NA)
```

Arguments

`clock_models`	a list of one or more clock models, as returned by `create_clock_model`
`mrca_prior`	a Most Recent Common Ancestor prior, as returned by `create_mrca_prior`
`tipdates_filename`	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

See Also

all MRCA priors' tracelog section is created by `mrca_priors_to_xml_tracelog`

Examples

```
# <logger id="tracelog" ...>
#'   # Here
# </logger>
```

`no_taxa_to_xml_tree` *Creates the 'tree' section of a BEAST2 XML parameter file, which is part of a 'state' section, without being indented, when there is no tip-dating*

Description

The `tree` tag has these elements:

```
<tree[...]>
    <taxonset[...]>
    [...]
    </taxonset>
 </run>
```

Usage

```
no_taxa_to_xml_tree(id, inference_model)
```

Arguments

`id`	an alignment's IDs. An ID can be extracted from its FASTA filename with `get_alignment_ids_from_fasta_filenames`)
`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

Value

the random phylogeny as XML text

Author(s)

Richèl J.C. Bilderbeek

parameter_to_xml *Converts a parameter to XML*

Description

Converts a parameter to XML

Usage

```
parameter_to_xml(parameter)
```

Arguments

parameter	a parameter, as created by create_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
library(testthat)

xml <- parameter_to_xml(create_alpha_param(id = 1))
expect_equal(length(xml), 1)
expect_true(nchar(xml) > 1)
```

parameter_to_xml_alpha *Converts an alpha parameter to XML*

Description

Converts an alpha parameter to XML

Usage

```
parameter_to_xml_alpha(parameter)
```

Arguments

parameter	an alpha parameter, a numeric value. For advanced usage, use the structure as created by create_alpha_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

---

parameter_to_xml_beta *Converts a beta parameter to XML*

Description

Converts a beta parameter to XML

Usage

```
parameter_to_xml_beta(parameter)
```

Arguments

parameter	a beta parameter, a numeric value. For advanced usage, use the structure as created by create_beta_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

---

parameter_to_xml_clock_rate *Converts a clockRate parameter to XML*

Description

Converts a clockRate parameter to XML

Usage

```
parameter_to_xml_clock_rate(parameter)
```

Arguments

parameter	a clockRate parameter, a numeric value. For advanced usage, use the structure as created by create_clock_rate_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

`parameter_to_xml_kappa_1`
Converts a kappa 1 parameter to XML

Description

Converts a kappa 1 parameter to XML

Usage

```
parameter_to_xml_kappa_1(parameter)
```

Arguments

`parameter`	a kappa 1 parameter, a numeric value. For advanced usage, use the structure as created by `create_kappa_1_param`)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

`parameter_to_xml_kappa_2`
Converts a kappa 2 parameter to XML

Description

Converts a kappa 2 parameter to XML

Usage

```
parameter_to_xml_kappa_2(parameter)
```

Arguments

parameter	a kappa 2 parameter, a numeric value. For advanced usage, use the structure as created by create_kappa_2_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

---

parameter_to_xml_lambda

Converts a lambda parameter to XML

Description

Converts a lambda parameter to XML

Usage

```
parameter_to_xml_lambda(parameter)
```

Arguments

parameter	a lambda parameter, a numeric value. For advanced usage, use the structure as created by create_lambda_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

parameter_to_xml_m *Converts a m parameter to XML*

Description

Converts a m parameter to XML

Usage

```
parameter_to_xml_m(parameter)
```

Arguments

parameter	a m parameter, a numeric value. For advanced usage, use the structure as created by create_m_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

parameter_to_xml_mean *Converts a mean parameter to XML*

Description

Converts a mean parameter to XML

Usage

```
parameter_to_xml_mean(parameter)
```

Arguments

parameter	a mean parameter, a numeric value. For advanced usage, use the structure as created by create_mean_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

parameter_to_xml_mu *Converts a mu parameter to XML*

Description

Converts a mu parameter to XML

Usage

```
parameter_to_xml_mu(parameter)
```

Arguments

parameter	a mu parameter, a numeric value. For advanced usage, use the structure as created by create_mu_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

parameter_to_xml_rate_ac *Converts a 'rate AC' parameter to XML*

Description

Converts a 'rate AC' parameter to XML

Usage

```
parameter_to_xml_rate_ac(parameter, which_name = "state_node")
```

Arguments

parameter	a 'rate AC' parameter, a numeric value. For advanced usage, use the structure as created by create_rate_ac_param)
which_name	the name, can be state_node or rate_name

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

`parameter_to_xml_rate_ag` *Converts a 'rate AG' parameter to XML*

Description

Converts a 'rate AG' parameter to XML

Usage

```
parameter_to_xml_rate_ag(parameter, which_name = "state_node")
```

Arguments

`parameter`	a 'rate AG' parameter, a numeric value. For advanced usage, use the structure as created by `create_rate_ag_param`)
`which_name`	the name, can be `state_node` or `rate_name`

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

`parameter_to_xml_rate_at` *Converts a 'rate AT' parameter to XML*

Description

Converts a 'rate AT' parameter to XML

Usage

```
parameter_to_xml_rate_at(parameter, which_name = "state_node")
```

Arguments

`parameter`	a 'rate AT' parameter, a numeric value. For advanced usage, use the structure as created by `create_rate_at_param`)
`which_name`	the name, can be `state_node` or `rate_name`

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

`parameter_to_xml_rate_cg`
Converts a 'rate CG' parameter to XML

Description

Converts a 'rate CG' parameter to XML

Usage

```
parameter_to_xml_rate_cg(parameter, which_name = "state_node")
```

Arguments

`parameter`	a 'rate CG' parameter, a numeric value. For advanced usage, use the structure as created by `create_rate_cg_param`)
`which_name`	the name, can be `state_node` or `rate_name`

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

`parameter_to_xml_rate_ct`
Converts a 'rate CT' parameter to XML

Description

Converts a 'rate CT' parameter to XML

Usage

```
parameter_to_xml_rate_ct(parameter, which_name = "state_node")
```

Arguments

parameter	a 'rate CT' parameter, a numeric value. For advanced usage, use the structure as created by create_rate_ct_param)
which_name	the name, can be state_node or rate_name

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

---

parameter_to_xml_rate_gt

Converts a 'rate GT' parameter to XML

Description

Converts a 'rate GT' parameter to XML

Usage

```
parameter_to_xml_rate_gt(parameter, which_name = "state_node")
```

Arguments

parameter	a 'rate GT' parameter, a numeric value. For advanced usage, use the structure as created by create_rate_gt_param)
which_name	the name, can be state_node or rate_name

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

parameter_to_xml_s *Converts a s parameter to XML*

Description

Converts a s parameter to XML

Usage

```
parameter_to_xml_s(parameter)
```

Arguments

parameter	a s parameter, a numeric value. For advanced usage, use the structure as created by create_s_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

parameter_to_xml_scale *Converts a scale parameter to XML*

Description

Converts a scale parameter to XML

Usage

```
parameter_to_xml_scale(parameter)
```

Arguments

parameter	a scale parameter, a numeric value. For advanced usage, use the structure as created by create_scale_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

parameter_to_xml_sigma *Converts a sigma parameter to XML*

Description

Converts a sigma parameter to XML

Usage

```
parameter_to_xml_sigma(parameter)
```

Arguments

parameter	a sigma parameter, a numeric value. For advanced usage, use the structure as created by create_sigma_param)

Value

the parameter as XML text

Author(s)

Richèl J.C. Bilderbeek

phylo_to_xml_state *Creates the XML of a phylogeny, as used in the* state *section*

Description

Creates the XML of a phylogeny, as used in the state section

Usage

```
phylo_to_xml_state(
  id = "irrelevant",
  inference_model = "irrelevant",
  tipdates_filename = "deprecated"
)
```

Arguments

id	the ID of the alignment
inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
tipdates_filename	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

the random phylogeny as XML text

Author(s)

Richèl J.C. Bilderbeek

---

remove_empty_lines *Remove all lines that are only whitespace*

Description

Remove all lines that are only whitespace

Usage

```
remove_empty_lines(lines, trim = FALSE)
```

Arguments

lines	character vector with text
trim	FALSE if indentation must be preserved, TRUE will remove all surrounding whitespace

Value

the lines with text

Author(s)

Richèl J.C. Bilderbeek

remove_multiline *Remove consecutive lines*

Description

Remove consecutive lines

Usage

```
remove_multiline(text, lines_to_remove)
```

Arguments

text	lines of characters
lines_to_remove	lines of character that need to be removed from text

Value

lines of text

Author(s)

Richèl J.C. Bilderbeek

rename_inference_model_filenames *Rename the filenames in an inference model*

Description

Rename the filenames in an inference model

Usage

```
rename_inference_model_filenames(inference_model, rename_fun)
```

Arguments

inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.

rename_fun — a function to rename a filename, as can be checked by check_rename_fun. This function should have one argument, which will be a filename or NA. The function should return one filename (when passed one filename) or one NA (when passed one NA). Example rename functions are:

- get_remove_dir_fun get a function that removes the directory paths from the filenames, in effect turning these into local files
- get_replace_dir_fun get a function that replaces the directory paths from the filenames
- get_remove_hex_fun get a function that removes the hex string from filenames. For example, `tracelog_82c1a522040.log` becomes `tracelog.log`

Value

an inference model with the renamed filenames

Examples

```
library(testthat)

inference_model <- create_inference_model()
inference_model$mcmc$tracelog$filename <- "trace.log"
inference_model$mcmc$screenlog$filename <- "screen.log"
inference_model$mcmc$treelog$filename <- "tree.log"
inference_model$tipdates_filename <- "tipdates.csv"

# Nah, put the files in a folder
inference_model <- rename_inference_model_filenames(
  inference_model = inference_model,
  rename_fun = get_replace_dir_fun("/home/john")
)

expect_equal(inference_model$mcmc$tracelog$filename, "/home/john/trace.log")
expect_equal(
  inference_model$mcmc$screenlog$filename, "/home/john/screen.log"
)
expect_equal(inference_model$mcmc$treelog$filename, "/home/john/tree.log")
expect_equal(inference_model$tipdates_filename, "/home/john/tipdates.csv")

# Nah, put the files in anoth folder
inference_model <- rename_inference_model_filenames(
  inference_model = inference_model,
  rename_fun = get_replace_dir_fun("/home/doe")
)

expect_equal(inference_model$mcmc$tracelog$filename, "/home/doe/trace.log")
expect_equal(inference_model$mcmc$screenlog$filename, "/home/doe/screen.log")
expect_equal(inference_model$mcmc$treelog$filename, "/home/doe/tree.log")
expect_equal(inference_model$tipdates_filename, "/home/doe/tipdates.csv")

# Nah, store the files locally
inference_model <- rename_inference_model_filenames(
```

```
  inference_model = inference_model,
  rename_fun = get_remove_dir_fun()
)

expect_equal(inference_model$mcmc$tracelog$filename, "trace.log")
expect_equal(inference_model$mcmc$screenlog$filename, "screen.log")
expect_equal(inference_model$mcmc$treelog$filename, "tree.log")
expect_equal(inference_model$tipdates_filename, "tipdates.csv")
```

`rename_mcmc_filenames` *Rename the filenames within an MCMC*

Description

Rename the filenames within an MCMC

Usage

```
rename_mcmc_filenames(mcmc, rename_fun)
```

Arguments

`mcmc`	one MCMC. Use `create_mcmc` to create an MCMC. Use `create_ns_mcmc` to create an MCMC for a Nested Sampling run. Use `check_mcmc` to check if an MCMC is valid. Use `rename_mcmc_filenames` to rename the filenames in an MCMC.
`rename_fun`	a function to rename a filename, as can be checked by check_rename_fun. This function should have one argument, which will be a filename or NA. The function should return one filename (when passed one filename) or one NA (when passed one NA). Example rename functions are: • get_remove_dir_fun get a function that removes the directory paths from the filenames, in effect turning these into local files • get_replace_dir_fun get a function that replaces the directory paths from the filenames • get_remove_hex_fun get a function that removes the hex string from filenames. For example, `tracelog_82c1a522040.log` becomes `tracelog.log`

Examples

```
library(testthat)

# Create an MCMC with local filenames
mcmc <- create_mcmc()
mcmc$tracelog$filename <- "trace.log"
mcmc$screenlog$filename <- "screen.log"
mcmc$treelog$filename <- "tree.log"

# Nah, files should be put in '/home/john' folder
```

```
mcmc <- rename_mcmc_filenames(
  mcmc = mcmc,
  rename_fun = get_replace_dir_fun("/home/john")
)

expect_equal(mcmc$tracelog$filename, "/home/john/trace.log")
expect_equal(mcmc$screenlog$filename, "/home/john/screen.log")
expect_equal(mcmc$treelog$filename, "/home/john/tree.log")

# Nah, files should be put in '/home/doe' folder instead
mcmc <- rename_mcmc_filenames(
  mcmc = mcmc,
  rename_fun = get_replace_dir_fun("/home/doe")
)

expect_equal(mcmc$tracelog$filename, "/home/doe/trace.log")
expect_equal(mcmc$screenlog$filename, "/home/doe/screen.log")
expect_equal(mcmc$treelog$filename, "/home/doe/tree.log")

# Nah, files should be put in local folder instead
mcmc <- rename_mcmc_filenames(
  mcmc = mcmc,
  rename_fun = get_remove_dir_fun()
)

expect_equal(mcmc$tracelog$filename, "trace.log")
expect_equal(mcmc$screenlog$filename, "screen.log")
expect_equal(mcmc$treelog$filename, "tree.log")
```

`rln_clock_model_to_xml_mean_rate_prior` *Used by* `clock_models_to_xml_prior_distr`

Description

Used by `clock_models_to_xml_prior_distr`

Usage

```
rln_clock_model_to_xml_mean_rate_prior(rln_clock_model)
```

Arguments

`rln_clock_model`	a Relaxed Log-Normal clock model, as returned by `create_rln_clock_model`

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

`rnd_phylo_to_xml_init` *Creates the XML of a random phylogeny, as used in the* `init` *section*

Description

Creates the XML text for the `beast` tag of a BEAST2 parameter file, which is directly after the XML declaration (created by create_xml_declaration.

Usage

```
rnd_phylo_to_xml_init(inference_model, id = "deprecated")
```

Arguments

`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
`id`	an alignment's IDs. An ID can be extracted from its FASTA filename with `get_alignment_ids_from_fasta_filenames`)

Details

The `init` tag has these elements:

```
<init id=\"RandomTree.t:[...]>
    <populationModel[...]>
    [...]
    </populationModel>
</init>
```

Value

the phylogeny as XML text

Author(s)

Richèl J.C. Bilderbeek

`site_models_to_xml_operators`
Write the XML `operators` *section from the site models.*

Description

Write the XML `operators` section from the site models.

Usage

```
site_models_to_xml_operators(site_models)
```

Arguments

`site_models`	one or more site models, as returned by `create_site_model`

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

`site_models_to_xml_prior_distr`
Represent the site models as XML

Description

Represent the site models as XML

Usage

```
site_models_to_xml_prior_distr(site_models)
```

Arguments

`site_models`	one or more site models, as returned by `create_site_model`

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

`site_models_to_xml_state`

Converts one or more clock models to the `state` *section of the XML as text*

Description

Converts one or more clock models to the `state` section of the XML as text

Usage

```
site_models_to_xml_state(site_models)
```

Arguments

`site_models`	one or more site models, as returned by `create_site_model`

Value

lines of XML text, without indentation nor `state` tags

Author(s)

Richèl J.C. Bilderbeek

`site_models_to_xml_tracelog`

Creates the site models' XML for the tracelog section

Description

Creates the site models' XML for the tracelog section

Usage

```
site_models_to_xml_tracelog(site_models)
```

Arguments

site_models	one or more site models, as returned by create_site_model

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

See Also

the complete tracelog section is created by create_tracelog_xml

Examples

```
# <logger id="tracelog" ...>
#'   # Here
# </logger>
```

---

site_model_to_xml_lh_distr

Creates the XML text for the siteModel *tag of a BEAST2 parameter file.*

Description

Creates the XML text for the siteModel tag of a BEAST2 parameter file, which is part of the distribution node for the treeLikelihood ID.

Usage

```
site_model_to_xml_lh_distr(inference_model, site_model = "deprecated")
```

Arguments

inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
site_model	a site model, as returned by create_site_model

Details

The `siteModel` tag has these elements:

```
<siteModel[...]>
    [parameters]
</siteModel>
```

Value

the site model as XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior"[...]">
#     <distribution id="likelihood" [...]>
#       <siteModel...>
#         [parameters]
#       </siteModel>
#     </distribution>
# </distribution>
```

---

site_model_to_xml_operators

Converts a site model to XML, used in the `operators` *section*

Description

Converts a site model to XML, used in the `operators` section

Usage

```
site_model_to_xml_operators(site_model)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`

Value

the site model as XML text

Author(s)

Richèl J.C. Bilderbeek

`site_model_to_xml_prior_distr`
Converts a site model to XML, used in the `prior` *section*

Description

Converts a site model to XML, used in the `prior` section

Usage

```
site_model_to_xml_prior_distr(site_model)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`

Value

the site model as XML text

Author(s)

Richèl J.C. Bilderbeek

`site_model_to_xml_state`
Converts a site model to XML, used in the `state` *section*

Description

Converts a site model to XML, used in the `state` section

Usage

```
site_model_to_xml_state(site_model)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`

Value

the site model as XML text

Author(s)

Richèl J.C. Bilderbeek

site_model_to_xml_subst_model

Converts a site model to XML, used in the `substModel` *section*

Description

Converts a site model to XML, used in the `substModel` section

Usage

```
site_model_to_xml_subst_model(inference_model, site_model = "deprecated")
```

Arguments

`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
`site_model`	a site model, as returned by `create_site_model`

Value

the site model as XML text

Author(s)

Richèl J.C. Bilderbeek

site_model_to_xml_tracelog

Creates the site model's XML for the tracelog section

Description

Creates the site model's XML for the tracelog section

Usage

```
site_model_to_xml_tracelog(site_model)
```

Arguments

`site_model`	a site model, as returned by `create_site_model`

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

See Also

all site models' tracelog section is created by site_models_to_xml_tracelog

Examples

```
# <logger id="tracelog" ...>
#'   # Here
# </logger>
```

---

taxa_to_xml_tree *Creates the 'tree' section of a BEAST2 XML parameter file*

Description

Creates the 'tree' section of a BEAST2 XML parameter file, which is part of a 'state' section, without being indented.

Usage

```
taxa_to_xml_tree(
  inference_model,
  id = "deprecated",
  tipdates_filename = "deprecated"
)
```

Arguments

inference_model	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
id	an alignment's IDs. An ID can be extracted from its FASTA filename with get_alignment_ids_from_fasta_filenames)
tipdates_filename	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Details

The `tree` tag has these elements:

```
<tree[...]>
    <taxonset[...]>
    [...]
    </taxonset>
 </run>
```

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

`tipdate_taxa_to_xml_tree` *Creates the* `tree` *section (part of the* `state` *section) when there is tip-dating*

Description

Creates the `tree` section (part of the `state` section) when there is tip-dating

Usage

```
tipdate_taxa_to_xml_tree(id, tipdates_filename)
```

Arguments

`id`	an alignment's IDs. An ID can be extracted from its FASTA filename with `get_alignment_ids_from_fasta_filenames`)
`tipdates_filename`	name of the file containing the tip dates. This file is assumed to have two columns, separated by a tab. The first column contains the taxa names, the second column contains the date.

Value

the random phylogeny as XML text

Author(s)

Richèl J.C. Bilderbeek

`tree_models_to_xml_tracelog` *Creates the tree models' XML for the tracelog section*

Description

Creates the tree models' XML for the tracelog section

Usage

```
tree_models_to_xml_tracelog(site_models)
```

Arguments

`site_models`	one or more site models, as returned by `create_site_model`

Value

lines of XML text

Note

use site_models just because it contains all IDs

Author(s)

Richèl J.C. Bilderbeek

See Also

the complete tracelog section is created by `create_tracelog_xml`

Examples

```
# <logger id="tracelog" ...>
#'   # Here
# </logger>
```

tree_priors_to_xml_operators

Creates the XML of a list of one or more tree priors, as used in the `operators` *section*

Description

Creates the XML of a list of one or more tree priors, as used in the `operators` section

Usage

```
tree_priors_to_xml_operators(
  tree_priors,
  fixed_crown_ages = rep(FALSE, times = length(tree_priors))
)
```

Arguments

`tree_priors`	one or more tree priors, as returned by `create_tree_prior`
`fixed_crown_ages`	one or more booleans to determine if the phylogenies' crown ages are fixed. If FALSE, crown age is estimated by BEAST2. If TRUE, the crown age is fixed to the crown age of the initial phylogeny.

Value

the tree priors as XML text

Author(s)

Richèl J.C. Bilderbeek

tree_priors_to_xml_prior_distr

Creates the distribution section in the prior section of the distribution section of a BEAST2 XML parameter file.

Description

These lines start with '<distribution id='

Usage

```
tree_priors_to_xml_prior_distr(tree_priors)
```

Arguments

tree_priors	one or more tree priors, as returned by create_tree_prior

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

---

tree_priors_to_xml_state

Converts one or more tree priors to the state *section of the XML as text*

Description

Converts one or more tree priors to the state section of the XML as text

Usage

```
tree_priors_to_xml_state(tree_priors = "deprecated")
```

Arguments

tree_priors	one or more tree priors, as returned by create_tree_prior

Value

lines of XML text, without indentation nor state tags

Author(s)

Richèl J.C. Bilderbeek

tree_priors_to_xml_tracelog

Creates the tree priors' XML for the tracelog section

Description

Creates the tree priors' XML for the tracelog section

Usage

```
tree_priors_to_xml_tracelog(tree_priors)
```

Arguments

tree_priors	one or more tree priors, as returned by create_tree_prior

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

See Also

the complete tracelog section is created by create_tracelog_xml

Examples

```
# <logger id="tracelog" ...>
#'   # Here
# </logger>
```

tree_prior_to_xml_operators

Creates the XML of a tree prior, as used in the operators *section*

Description

Creates the XML of a tree prior, as used in the operators section

Usage

```
tree_prior_to_xml_operators(tree_prior, fixed_crown_age = FALSE)
```

Arguments

tree_prior	a tree priors, as returned by create_tree_prior
fixed_crown_age	determines if the phylogeny's crown age is fixed. If FALSE, crown age is estimated by BEAST2. If TRUE, the crown age is fixed to the crown age of the initial phylogeny.

Value

the tree prior as XML text

Author(s)

Richèl J.C. Bilderbeek

---

tree_prior_to_xml_prior_distr

Creates the distribution section in the prior section of the distribution section of a BEAST2 XML parameter file.

Description

These lines start with '<distribution id='

Usage

```
tree_prior_to_xml_prior_distr(tree_prior)
```

Arguments

tree_prior	a tree priors, as returned by create_tree_prior

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

Examples

```
# <distribution id="posterior" spec="util.CompoundDistribution">
#     <distribution id="prior" spec="util.CompoundDistribution">
#       HERE, where the ID of the distribution is 'prior'
#     </distribution>
#     <distribution id="likelihood" ...>
#     </distribution>
# </distribution>
```

tree_prior_to_xml_state

Creates the XML of a tree prior, as used in the `state` *section*

Description

Creates the XML of a tree prior, as used in the `state` section

Usage

```
tree_prior_to_xml_state(inference_model, tree_prior = "deprecated")
```

Arguments

`inference_model`	a Bayesian phylogenetic inference model. An inference model is the complete model setup in which a site model, clock model, tree prior and more are specified. Use create_inference_model to create an inference model. Use check_inference_model to check if an inference model is valid. Use rename_inference_model_filenames to rename the files in an inference model.
`tree_prior`	a tree priors, as returned by `create_tree_prior`

Value

the tree prior as XML text

Author(s)

Richèl J.C. Bilderbeek

tree_prior_to_xml_tracelog

Creates the tree prior's XML for the tracelog section

Description

Creates the tree prior's XML for the tracelog section

Usage

```
tree_prior_to_xml_tracelog(tree_prior)
```

Arguments

`tree_prior`	a tree priors, as returned by `create_tree_prior`

Value

lines of XML text

Author(s)

Richèl J.C. Bilderbeek

See Also

all tree priors' tracelog section is created by `tree_priors_to_xml_tracelog`

Examples

```
# <logger id="tracelog" ...>
#'   # Here
# </logger>
```

---

yule_tree_prior_to_xml_prior_distr

Creates the `prior` *section in the prior section of the prior section of the distribution section of a BEAST2 XML parameter file for a Yule tree prior*

Description

Creates the `prior` section in the prior section of the prior section of the distribution section of a BEAST2 XML parameter file for a Yule tree prior

Usage

```
yule_tree_prior_to_xml_prior_distr(yule_tree_prior)
```

Arguments

`yule_tree_prior` a Yule tree_prior, as created by `create_yule_tree_prior`

Author(s)

Richèl J.C. Bilderbeek

Examples

```
 # <distribution id="posterior" spec="util.CompoundDistribution">
 #     <distribution id="prior" spec="util.CompoundDistribution">
 #       HERE, where the ID of the distribution is 'prior'
 #     </distribution>
 #     <distribution id="likelihood" ...>
 #     </distribution>
 # </distribution>
```
