covr-package covr: Test coverage for packages

Description

covr tracks and reports code coverage for your package and (optionally) upload the results to a coverage service like 'Codecov' http://codecov.io or 'Coveralls' http://coveralls.io. Code coverage is a measure of the amount of code being exercised by a set of tests. It is an indirect measure of test quality and completeness. This package is compatible with any testing methodology or framework and tracks coverage of both R code and compiled C/C++/FORTRAN code.

Details

A coverage report can be used to inspect coverage for each line in your package. Using report() requires the additional dependencies DT and htmltools.

If run with no arguments `report()` implicitly calls `package_coverage()`
report()

azure

Run covr on a package and output the result so it is available on Azure Pipelines

Description

Run covr on a package and output the result so it is available on Azure Pipelines

Usage

```
azure(
    ...,
    coverage = package_coverage(..., quiet = quiet),
    filename = "coverage.xml",
    quiet = TRUE
)
```

Arguments

```
arguments passed to package_coverage()
coverage an existing coverage object to submit, if NULL, package_coverage() will be called with the arguments from ...
filename the name of the Cobertura XML file
quiet if FALSE, print the coverage before submission.
```

codecov 5

codecov

Run covr on a package and upload the result to codecov.io

Description

Run covr on a package and upload the result to codecov.io

Usage

```
codecov(
    ...,
    coverage = NULL,
    base_url = "https://codecov.io",
    token = NULL,
    commit = NULL,
    branch = NULL,
    pr = NULL,
    flags = NULL,
    quiet = TRUE
)
```

Arguments

• • •	arguments passed to package_coverage()
coverage	an existing coverage object to submit, if NULL, package_coverage() will be called with the arguments from \dots
base_url	Codecov url (change for Enterprise)
token	a codecov upload token, if NULL then following external sources will be checked in this order: $ \\$
	1. the environment variable 'CODECOV_TOKEN'. If it is empty, then
	package will look at directory of the package for a file codecov.yml. File must have codecov section where field token is set to a token that will be used.
commit	explicitly set the commit this coverage result object corresponds to. Is looked up from the service or locally if it is $NULL$.
branch	explicitly set the branch this coverage result object corresponds to, this is looked up from the service or locally if it is NULL.
pr	explicitly set the pr this coverage result object corresponds to, this is looked up from the service if it is $NULL$.
flags	A flag to use for this coverage upload see https://docs.codecov.io/docs/flags for details.
quiet	if FALSE, print the coverage before submission.

6 coverage_to_list

Examples

```
## Not run:
codecov(path = "test")
## End(Not run)
```

code_coverage

Calculate coverage of code directly

Description

This function is useful for testing, and is a thin wrapper around file_coverage() because parseData is not populated properly unless the functions are defined in a file.

Usage

```
code_coverage(
  source_code,
  test_code,
  line_exclusions = NULL,
  function_exclusions = NULL,
  ...
)
```

Arguments

Additional arguments passed to file_coverage()

coverage_to_list

Convert a coverage dataset to a list

Description

Convert a coverage dataset to a list

```
coverage_to_list(x = package_coverage())
```

coveralls 7

Arguments

x a coverage dataset, defaults to running package_coverage().

Value

A list containing coverage result for each individual file and the whole package

coveralls

Run covr on a package and upload the result to coveralls

Description

Run covr on a package and upload the result to coveralls

Usage

```
coveralls(
    ...,
    coverage = NULL,
    repo_token = Sys.getenv("COVERALLS_TOKEN"),
    service_name = Sys.getenv("CI_NAME", "travis-ci"),
    quiet = TRUE
)
```

Arguments

arguments passed to package_coverage()

an existing coverage object to submit, if NULL, package_coverage() will be called with the arguments from ...

repo_token

The secret repo token for your repository, found at the bottom of your repository's page on Coveralls. This is useful if your job is running on a service Coveralls doesn't support out-of-the-box. If set to NULL, it is assumed that the job is running on travis-ci

service_name

the CI service to use, if environment variable 'CI_NAME' is set that is used, otherwise 'travis-ci' is used.

quiet if FALSE, print the coverage before submission.

8 exclusions

environment_coverage Calculate coverage of an environment

Description

Calculate coverage of an environment

Usage

```
environment_coverage(
  env = parent.frame(),
  test_files,
  line_exclusions = NULL,
  function_exclusions = NULL)
```

Arguments

env The environment to be instrumented.

test_files Character vector of test files with code to test the functions

line_exclusions

a named list of files with the lines to exclude from each file.

function_exclusions

a vector of regular expressions matching function names to exclude. Example print\\\. to match print methods.

exclusions

Exclusions

Description

covr supports a couple of different ways of excluding some or all of a file.

Line Exclusions

The line_exclusions argument to package_coverage() can be used to exclude some or all of a file. This argument takes a list of filenames or named ranges to exclude.

Function Exclusions

Alternatively function_exclusions can be used to exclude R functions based on regular expression(s). For example print\\.* can be used to exclude all the print methods defined in a package from coverage.

file_coverage 9

Exclusion Comments

In addition you can exclude lines from the coverage by putting special comments in your source code. This can be done per line or by specifying a range. The patterns used can be specified by the exclude_pattern, exclude_start, exclude_end arguments to package_coverage() or by setting the global options covr.exclude_pattern, covr.exclude_start, covr.exclude_end.

Examples

```
## Not run:
# exclude whole file of R/test.R
package_coverage(exclusions = "R/test.R")
# exclude lines 1 to 10 and 15 from R/test.R
package_coverage(line_exclusions = list("R/test.R" = c(1:10, 15)))
# exclude lines 1 to 10 from R/test.R, all of R/test2.R
package_coverage(line_exclusions = list("R/test.R" = 1:10, "R/test2.R"))
# exclude all print and format methods from the package.
package_coverage(function_exclusions = c("print\\.", "format\\."))
# single line exclusions
f1 <- function(x) {</pre>
 x + 1 # nocov
# ranged exclusions
f2 <- function(x) { # nocov start</pre>
 x + 2
} # nocov end
## End(Not run)
```

file_coverage

Calculate test coverage for sets of files

Description

The files in source_files are first sourced into a new environment to define functions to be checked. Then they are instrumented to track coverage and the files in test_files are sourced.

```
file_coverage(
  source_files,
  test_files,
  line_exclusions = NULL,
  function_exclusions = NULL,
  parent_env = parent.frame()
)
```

10 function_coverage

Arguments

parent_env The parent environment to use when sourcing the files.

file_report

A coverage report for a specific file

Description

A coverage report for a specific file

Usage

```
file_report(
  x = package_coverage(),
  file = NULL,
  out_file = file.path(tempdir(), paste0(get_package_name(x), "-file-report.html")),
  browse = interactive()
)
```

Arguments

x a coverage dataset, defaults to running package_coverage().

file The file to report on, if NULL, use the first file in the coverage output.

out_file The output file

browse whether to open a browser to view the report.

function_coverage

Calculate test coverage for a specific function.

Description

Calculate test coverage for a specific function.

```
function_coverage(fun, code = NULL, env = NULL, enc = parent.frame())
```

gitlab 11

Arguments

fun	name of the function.
code	expressions to run.
env	environment the function is defined in.
enc	the enclosing environment which to run the expressions.

gitlab

Run covr on package and create report for GitLab

Description

Utilize internal GitLab static pages to publish package coverage. Creates local covr report in a package subdirectory. Uses the pages GitLab job to publish the report.

Usage

```
gitlab(..., coverage = NULL, file = "public/coverage.html", quiet = TRUE)
```

Arguments

... arguments passed to package_coverage()

coverage an existing coverage object to submit, if NULL, package_coverage() will be

called with the arguments from . . .

file The report filename.

quiet if FALSE, print the coverage before submission.

in_covr

Determine if code is being run in covr

Description

covr functions set the environment variable R_COVR when they are running. in_covr() returns TRUE if this environment variable is set and FALSE otherwise.

Usage

```
in_covr()
```

Examples

```
if (require(testthat)) {
  testthat::skip_if(in_covr())
}
```

12 package_coverage

package_coverage Ca

Calculate test coverage for a package

Description

This function calculates the test coverage for a development package on the path. By default it runs only the package tests, but it can also run vignette and example code.

Usage

```
package_coverage(
  path = ".",
  type = c("tests", "vignettes", "examples", "all", "none"),
  combine_types = TRUE,
  relative_path = TRUE,
  quiet = TRUE,
  clean = TRUE,
  line_exclusions = NULL,
  function_exclusions = NULL,
  code = character(),
    ...,
  exclusions,
  pre_clean = TRUE
)
```

Arguments

path file path to the package.

run the package 'tests', 'vignettes', 'examples', 'all', or 'none'. The default is

'tests'.

combine_types If TRUE (the default) the coverage for all types is simply summed into one cov-

erage object. If FALSE separate objects are used for each type of coverage.

relative_path whether to output the paths as relative or absolute paths.

quiet whether to load and compile the package quietly, useful for debugging errors.

clean whether to clean temporary output files after running, mainly useful for debug-

ging errors.

line_exclusions

a named list of files with the lines to exclude from each file.

function_exclusions

a vector of regular expressions matching function names to exclude. Example

print\\\. to match print methods.

code A character vector of additional test code to run.

... Additional arguments passed to tools::testInstalledPackage().

exclusions 'Deprecated', please use 'line exclusions' instead.

pre_clean whether to delete all objects present in the src directory before recompiling

percent_coverage 13

Details

This function uses tools::testInstalledPackage() to run the code, if you would like to test your package in another way you can set type = "none" and pass the code to run as a character vector to the code parameter.

Parallelized code using **parallel**'s mcparallel() needs to use a patched parallel:::mcexit. This is done automatically if the package depends on **parallel**, but can also be explicitly set using the environment variable COVR_FIX_PARALLEL_MCEXIT or the global option covr.fix_parallel_mcexit.

See Also

exclusions() For details on excluding parts of the package from the coverage calculations.

percent_coverage

Provide percent coverage of package

Description

Calculate the total percent coverage from a coverage result object.

Usage

```
percent_coverage(x, ...)
```

Arguments

x the coverage object returned from package_coverage()... additional arguments passed to tally_coverage()

Value

The total percentage as a numeric(1).

print.coverage

Print a coverage object

Description

Print a coverage object

```
## S3 method for class 'coverage'
print(x, group = c("filename", "functions"), by = "line", ...)
```

14 report

Arguments

the coverage object to be printed
 whether to group coverage by filename or function
 whether to count coverage by line or expression
 additional arguments ignored

Value

The coverage object (invisibly).

report

Display covr results using a standalone report

Description

Display covr results using a standalone report

Usage

```
report(
  x = package_coverage(),
  file = file.path(tempdir(), paste0(get_package_name(x), "-report.html")),
  browse = interactive()
)
```

Arguments

x a coverage dataset, defaults to running package_coverage().

file The report filename.

browse whether to open a browser to view the report.

Examples

```
## Not run:
x <- package_coverage()
report(x)
## End(Not run)</pre>
```

tally_coverage 15

tally_coverage

Tally coverage by line or expression

Description

Tally coverage by line or expression

Usage

```
tally_coverage(x, by = c("line", "expression"))
```

Arguments

x the coverage object returned from package_coverage()

by whether to tally coverage by line or expression

Value

a data. frame of coverage tallied by line or expression.

to_cobertura

Create a Cobertura XML file

Description

This functionality requires the xml2 package be installed.

Usage

```
to_cobertura(cov, filename = "cobertura.xml")
```

Arguments

cov the coverage object returned from package_coverage()

filename the name of the Cobertura XML file

Author(s)

Willem Ligtenberg

16 value

to_sonarqube

Create a SonarQube Generic XML file for test coverage according to https://docs.sonarqube.org/latest/analysis/generic-test/ Based on cobertura.R

Description

This functionality requires the xml2 package be installed.

Usage

```
to_sonarqube(cov, filename = "sonarqube.xml")
```

Arguments

cov the coverage object returned from package_coverage()

filename the name of the SonarQube Generic XML file

Author(s)

Talkdesk Inc.

value

Retrieve the value from an object

Description

Retrieve the value from an object

Usage

```
value(x, ...)
```

Arguments

x object from which to retrieve the value

... additional arguments passed to methods

zero_coverage 17

zero_coverage

Provide locations of zero coverage

Description

When examining the test coverage of a package, it is useful to know if there are any locations where there is 0 test coverage.

Usage

```
zero_coverage(x, ...)
```

Arguments

```
x a coverage object returned package_coverage()... additional arguments passed to tally_coverage()
```

Details

if used within RStudio this function outputs the results using the Marker API.

Value

A data.frame with coverage data where the coverage is 0.
