Package 'descomponer'

July 12, 2018

Type Package

Title Seasonal Adjustment by Frequency Analysis

Version 1.5

Date 2018-07-11

Author Francisco Parra <parra_fj@cantabria.es>

Maintainer Francisco Parra <parra_fj@cantabria.es>

Description Decompose a time series into seasonal, trend and irregular components using transformations to amplitude-frequency domain.

cdf *Get Auxiliary Matrix*

Description

Gets the auxiliary matrix to vector in time domain, pre-multiplies the vector by the orthogonal matrix,W, and its transpose, Parra F. (2013)

Usage

```
cdf(y)
```

Arguments

y	a vector of the observed time-serie values

Value

a matrix of sine and cosine waves adjusted to time-serie

Author(s)

Francisco Parra

References

Harvey, A.C. (1978), Linear Regression in the Frequency Domain, International Economic Review, 19, 507-512.

Parra, F. (2014), Amplitude time-frequency regression, (http://econometria.wordpress.com/2013/08/21/estimation-of-time-varying-regression-coefficients/)

Examples

```
n<-100;x<-seq(0,24*pi,length=n);y<-sin(x)+rnorm(n,sd=.3)
cdf(y)
```

celec *Consumption of electricity in Spain*

Description

A vector: celec, Miles de Tep, 1995 a 2013

Usage

```
data(celec)
```

Source

Instituto Nacional de Estadistica Spain

descomponer *Time series decomposition*

Description

Decompose a time series into seasonal, trend and irregular components using the transform amplitude-frequency domain to time series.

Usage

```
descomponer(y,frequency,type)
```

Arguments

y	a Vector of the observed time-serie values
frequency	Number of times in each unit time interval
type	lineal (1), quadratic(2)

Details

One could use a value of 7 for frequency when the data are sampled daily, and the natural time period is a week, or 4 and 12 when the data are sampled quarterly and monthly and the natural time period is a year.

Transforms the time series in amplitude-frequency domain, by a band spectrum regresion (Parra, F. ,2013) of the serie y_t and a OLS lineal trend, in which regression is carried out in the low and the sesaonal amplitude-frequency_t .The low frequency are the periodicity a n/2*frequency or (n-1)/2*frequency , if n is odd. The seasonal frequency are the periodicity: 2n/2*frequency,3n/2*frequency,4n/2*frequency,.. .

Use the "sort.data.frame" function, Kevin Wright (http://tolstoy.newcastle.edu.au/R/help/04/07/1076.html).

Slow computer in time series higher 1000 data.

The output is a data.frame object.

Value

y	The Vector of the observed time-serievalues
TDST	The trend and seasonal time serie of y
TD	The trend time serie of y
ST	The seasonal time serie of y
IR	The remainder time serie of y
regresoresTD	The regressors matrix use to the trend estimated
regresoresST	The regressors matrix use to the seasonal estimated
coeficientesTD	The coefficient vector use to the trend estimated
coeficientesSD	The coefficient vector use to the seasonal estimated

Examples

```
data(ipi)
datos <- descomponer(ipi,12,2)
plot(ts(datos$datos,frequency=12))
```

---

gdescomponer *Plotting the trend and seasonal*

Description

Plotting the trend and seasonal of time series.

Usage

```
gdescomponer(y,freq,type,year,q)
```

Arguments

y	a vector of the observed time-serie values
freq	Number of times in each unit time interval
type	lineal (1), quadratic(2)
year	the year of the first observation
q	the time of the first observation

gdf *Get Frequency Data*

Description

Transforms the data from the amplitude-time domain the amplitude-frequency domain pre-multiplied by the orthogonal matrix ,W, whose elements are defined in Harvey A.C. (1978).

Usage

```
gdf(y)
```

Arguments

y	a vector of the observed time-series values

Value

a vector of the estimated coefficients fourier

Author(s)

Francisco Parra

gdt

Examples

```
n<-100;x<-seq(0,24*pi,length=n);y<-sin(x)+rnorm(n,sd=.3)
gdf(y)
```

---

gdt *Get Time Data*

Description

Transforms the data from the amplitude-frequency domain the amplitude-time domain pre-multiplied by inverse of the orthogonal matrix ,W, whose elements are defined in Harvey A.C. (1978).

Usage

```
gdt(y)
```

Arguments

y	a vector of the coefficients fourier

Value

a vector of the observed time-series values

Author(s)

Francisco Parra

References

```

gperiodograma *Plotting method for specturm*

Description

Plotting method for specturm calculate by periodograma function.

Usage

```
gperiodograma(y)
```

Arguments

y	a vector of the observed time-serie values

References

Parra, F. (2014), Amplitude time-frequency regression, (http://econometria.wordpress.com/2013/08/21/estimation-of-time-varying-regression-coefficients/)

gtd *Plotting method for specturm*

Description

Plotting cumulative periodogram test.

Usage

```
gtd(y)
```

Arguments

y	a vector of the observed time-serie values

References

ipi *Indice de Produccion Industrial de Cantabria*

Description

A vector: IPI, Base: 2010. Enero 2002 a Abril 2014

Usage

```
data(ipi)
```

Source

Instituto Nacional de Estadistica Spain

MW *Get Frequency Data*

Description

Orthogonal matrix defined in Harvey (1978)

Usage

```
MW(n)
```

Arguments

n	rows and columuns number

Value

Orthogonal matrix of n X n dimensions

Author(s)

Francisco Parra

References

Harvey, A.C. (1978), Linear Regression in the Frequency Domain, International Economic Review, 19, 507-512.

periodograma *Periodogram*

Description

Calculates and displays the spectrum of the time serie

Usage

```
periodograma(y)
```

Arguments

y	a vector of the observed time-serie values

Value

frecuencia	Vector of frequencies at which the spectral density is estimated. The units are the reciprocal of cycles per unit time.
omega	Is calculated by pi*frecuencia/(n/2)
periodos	n/frecuencia
densidad	Vector of estimates of the spectral density at frequencies corresponding to frecuencia.

PIB *GDP Volume Index in Spain*

Description

A vector: PIB, Base: 2010. 1995 a 2013

Usage

```
data(PIB)
```

Source

Instituto Nacional de Estadistica Spain

---

predecirdf *Prediction whit Regression in domain frequency*

Description

Make a prediction for a rdf object

Usage

```
predecirdf(a,b)
```

Arguments

a	a model rdf
b	An optional data frame in which to look for variables with which to predict. If omitted, the fitted values are used.

Details

Use predict.lm, with interval="prediction"

Slow computer in time series higher 1000 data.

Value

fit	vector or matrix as above

data(PIB)
data(celec)
mod1=rdf(celec,PIB)
newdata=c(100)
predecirdf(mod1,newdata)
```

---

rdf *Regression in domain frequency*

Description

Make a Band Spectrum Regression using the comun frequencies in cross-spectrum .

Usage

```
rdf(y,x)
```

Arguments

y	a Vector of the dependent variable
x	a Vector of the independent variable

Details

Transforms the time series in amplitude-frequency domain, order the fourier coefficient by the comun frequencies in cross-spectrum, make a band spectrum regresion (Parra, F. ,2013) of the serie y_t and x_t for every set of fourier coefficients, and select the model to pass the Durbin test in the significance chosen.

If not find significance for Band Spectrum Regression, make a OLS.

The generalized cross validation (gcv), is caluculated by: gcv=n*sse/((n-k)^2)

where "sse" is the residual sums of squares, "n" the observation, and k the coefficients used in the band spectrum regression.

Slow computer in time series higher 1000 data.

The output is a data.frame object.

Value

`datos$Y`	The Y time-serie
`datos$X`	The X time-serie
`datos$F`	The time - serie fitted
`datos$reg`	The error time-serie
`Fregresores`	The matrix of regressors choosen in frequency domain
`Tregresores`	The matrix of regressors choosen in time domain
`Nregresores`	The coefficient number of fourier chosen
`sse`	Residual sums of squares
`gcv`	Generalized Cross Validation

td *Cumulative periodogram test*

Description

Cumulative periodogram test.

Usage

```
td(y)
```

Arguments

y	a vector of the observed time-serie values

Details

The output is a data.frame object.

Value

s2	Cumulative periodogram.
min	Is calculated by -c+(t/length(y))
max	Is calculated by c+(t/length(y))
