

Package ‘dostats’

August 29, 2016

Version 1.3.2

Date 2015-05-28

Title Compute Statistics Helper Functions

Author Andrew Redd <Andrew.Redd@hsc.utah.edu>

Maintainer Andrew Redd <Andrew.Redd@hsc.utah.edu>

URL <https://github.com/halpo/dostats>

License GPL (>= 3)

Depends R (>= 2.12.0)

Imports stats

Suggests plyr, testthat

Description A small package containing helper utilities for creating function for computing statistics.

Collate 'T.R' 'capply.R' 'collect.R' 'compose.R' 'consecutive.R' 'dostats.R' 'wargs.R' 'onarg.R' 'pval.R' 'utils.R'

NeedsCompilation no

redirf	10
seq_consecutive	10
wargs	11
%contains%	11

Index	13
--------------	-----------

<code>.T</code>	<i>create a text vector</i>
-----------------	-----------------------------

Description

create a text vector

Usage

`.T(...)`

Arguments

... names, quoted or not, no substitution made

Examples

`.T(min, mean, 'median')`

<code>capply</code>	<i>Conditional Apply</i>
---------------------	--------------------------

Description

A wrapper for `ifelse(test(x), fun(x, ...), x)`

Usage

`capply(test, x, fun, ...)`

Arguments

<code>test</code>	a test that returns a logical
<code>x</code>	data to apply fun to.
<code>fun</code>	to apply
...	other arguments to fun

class.stats	<i>Filter by class</i>
-------------	------------------------

Description

Filter by class

Usage

```
class.stats(.class)
numeric.stats(x, ...)
factor.stats(x, ...)
integer.stats(x, ...)
```

Arguments

.class	string for class to filter by
x	vector of any class
...	passed to dostats

Value

data frame of computed statistics if x is of class .class otherwise returns NULL.

See Also

[dostats](#)

collect	<i>collect results</i>
---------	------------------------

Description

collect results

Usage

```
collect(v, fun, ...)
```

Arguments

v	a vector, list, array, etc.
fun	a function to collect on
...	passed to f

Details

Collect results by recursively calling the elements of the vector v. The first two elements are called as fun(v[1], v[2], ...) The result is x. Then f(x, v[3]) is called and so forth, until all elements has been exhausted.

as such fun must take two arguments and return a single element, although there are no restrictions on what that single thing might be.

Examples

```
collect(v=letters, fun=function(x,y,...)paste(y,x, ...), sep='/')
```

compose

Nest functions

Description

Nest functions

Usage

```
compose(..., .list)
```

```
x %.% y
```

Arguments

...	functions to be nested together
.list	alternatively an explicit list of functions. If specified ... will be ignored.
x	a function
y	a function

Details

compose creates a functional composition of the listed functions. Functional composition of functions f and g is defined as f(g(.)). Order matters the right most function listed will be the innermost function in the composition, same with the operator version. To remember the order lists will be the order read out, ie. compose(f,g) = f(g(x))

When using the operator version it is good to remember that parentheses are recommended see the examples

Value

new function consisting of the functions nested

Author(s)

Andrew Redd

Examples

```
compose(any, is.na)(c(NA,1:3))
(sum%.%is.na)(c(1,NA)) #correct
## Not run:
sum%.%is.an(NA) #incorrect

## End(Not run)
```

dostats

Convenient interface for computing statistics on a vector

Description

Convenient interface for computing statistics on a vector

Usage

```
dostats(x, ..., .na.action = na.fail)
```

Arguments

x	the vector
...	statistics to compute, must take a vector and return a vector
.na.action	the action to take on NA values, for all statistics

Value

A one row data.frame with columns named as in ...

Author(s)

Andrew Redd

See Also

[ldply](#)

Examples

```
data(mtcars)
library(plyr)
dostats(1:10, mean, median, sd, quantile, IQR)
ldply(mtcars, dostats, median, mean, sd, quantile, IQR)
```

fill_v	<i>Fill vector to length with a specified value</i>
--------	---

Description

Fill vector to length with a specified value

Usage

```
fill_v(x, l = length(x), with = last(x), after = length(x))
```

Arguments

x	vector
l	length
with	What to fill with
after	where to insert

first	<i>Head/Tail shortcuts</i>
-------	----------------------------

Description

Shortcuts for head(x,1) and tail(x, 1)

Usage

```
first(x, ..., n = 1)
```

```
last(x, ..., n = 1)
```

Arguments

x	vector object
...	passed on to head or tail
n	the new number to take of only one.

listrows	<i>List rows of a data frame in a list.</i>
----------	---

Description

List rows of a data frame in a list.

Usage

```
listrows(d)
```

Arguments

d	a data.frame
---	--------------

make_call	<i>Make a call with extra arguments incorporated into call.</i>
-----------	---

Description

Usefull for using with plyr functions

Usage

```
make_call(args, ..., what, quote = F, envir = parent.frame())
```

Arguments

args	a list of arguments
...	extra arguments to be incorporated into args
what	the function to execute
quote	should the arguments be quoted
envir	the environment to call the function in

See Also

[do.call](#) which this function wraps.

make_new_id	<i>Make a helper ID counter</i>
-------------	---------------------------------

Description

Make a helper ID counter

Usage

```
make_new_id(startat = 0)
```

Arguments

startat	where to start counting
---------	-------------------------

me	<i>Return the current function</i>
----	------------------------------------

Description

Return the current function

Usage

```
me()
```

See Also

[sys.function](#)

onarg	<i>change first argument of a function</i>
-------	--

Description

change first argument of a function

Usage

```
onarg(f, arg)
```

Arguments

f	the function
arg	the arg to be called as the first argument

Value

a function that calls `f` with `arg` as the first argument.

See Also

[wargs](#), [dostats](#), and [apply](#)

Examples

```
formals(runif)
onarg(runif, 'max')(1:10, 1)
onarg(runif, 'max')(1:10, 10)
#another version of contains
onarg(`%in%`, 'table')(letters, 'y')
```

pval

Extract a p-value fomr a test result.

Description

Extract a p-value fomr a test result.

Usage

```
pval(x, extended = F, ...)
```

Arguments

<code>x</code>	a testing result object
<code>extended</code>	should an extended result be given or a single p-value.
<code>...</code>	extra agruments

Details

This is a generic helper function for extracting p values from objects. The idea being to extract the overall p-value for the model that can be interpreted simply.

Value

either a single value (`extended=FALSE`) representing the p-value of the test or a single row. [data.frame](#) object that also incldues extra information such as

redirf	<i>Create a function that redirects to the named function.</i>
--------	--

Description

This is usefull for debugging to know what function has been called form within do.call or plyr functions.

Usage

```
redirf(f, envir = parent.frame())
```

Arguments

f	a function to wrap a call around
envir	environment to use for the function.

seq_consecutive	<i>compute an indicator to group consecutive values</i>
-----------------	---

Description

computes a vector that changes every time the element is different from the previous.

Usage

```
seq_consecutive(x, ...)
```

Arguments

x	a vector
...	ignored, might be used for forward compatibility.

Value

an integer vector.

wargs	<i>Call with arguments.</i>
-------	-----------------------------

Description

Call with arguments.

Usage

```
wargs(f, ..., args = pairlist(...), envir = parent.frame())
```

Arguments

f	a function
...	extra arguments
args	alternate way to provide arguments as a pairlist.
envir	environment to use for the function.

Value

a function that takes 1 argument and calls f with the single argument and the additional ... appended.

Examples

```
mean2 <- wargs(mean, na.rm=TRUE)
```

%contains%	<i>Does a table contain a value</i>
------------	-------------------------------------

Description

Does a table contain a value

Usage

```
table %contains% y
```

Arguments

table	a table of values
y	a value

Details

Literally

Value

a logical vector of the same length as `y` indicating if `y` is in `table`, i.e. the table contains `y`.
