

# Package ‘fanplot’

December 18, 2019

**Type** Package

**Title** Visualisation of Sequential Probability Distributions Using Fan Charts

**Version** 3.4.2

**Maintainer** Guy J. Abel <g.j.abel@gmail.com>

**Description** Visualise sequential distributions using a range of plotting styles. Sequential distribution data can be input as either simulations or values corresponding to percentiles over time. Plots are added to existing graphic devices using the fan function. Users can choose from four different styles, including fan chart type plots, where a set of coloured polygon, with shadings corresponding to the percentile values are layered to represent different uncertainty levels. Full details in R Journal article; Abel (2015) <doi:10.32614/RJ-2015-002>.

**License** GPL-2

**URL** <https://github.com/gjabel/fanplot>

**BugReports** <https://github.com/gjabel/fanplot/issues>

**Imports** methods

**Depends** R (>= 2.10)

**Suggests** shiny

**LazyData** true

**NeedsCompilation** no

**Author** Guy J. Abel [aut, cre] (<<https://orcid.org/0000-0002-4893-5687>>)

**Repository** CRAN

**Date/Publication** 2019-12-18 15:30:10 UTC

fanplot-package	<i>Visualisation of Sequential Probability Distributions Using Fan Charts.</i>
-----------------	--

---

### Description

Visualise sequential distributions using a range of plotting styles. Sequential distribution data can be input as either simulations or values corresponding to percentiles over time. Plots are added to existing graphic devices using the fan function. Users can choose from four different styles, including fan chart type plots, where a set of coloured polygon, with shadings corresponding to the percentile values are layered to represent different uncertainty levels.

boe	<i>Parameters for MPC CPI Inflation Projections from Q1 2004 to Q4 2013.</i>
-----	--

---

### Description

Numerical parameters for inflation report of the Bank of England used to specify the probability distributions for forecast charts of CPI inflation. Data formatted from the November 2013 Bank of England Inflation Report.

**Usage**

```
data(boe)
```

**Format**

A data frame with 512 observations on the following 5 variables.

time0 Publication time of parameters

time Future time of projected parameter

mode Central location parameter of split-normal distribution

uncertainty Uncertainty parameter of split-normal distribution

skew Skew parameter of split-normal distribution

**Details**

mode, uncertainty and skew parameters relate to those given in `dsplitnorm`, where uncertainty is the standard deviation.

```

---

cpi *Percentage Change (over 12 months) of United Kingdom Consumer Price Inflation*

---

### Description

Time series of quarterly UK CPI from Q1 1997 to Q3 2013. Data formatted from the October 2013 release of the CPI data by the Office of National Statistics. Q1 are taken from February values, Q2 from May, Q3 from August and Q4 from November.

### Usage

```
data(cpi)
```

### Format

The format is: Time-Series [1:67] from 1997 to 2014: 88.8 89.6 90 90.4 90.3 91.5 91.2 91.7 91.5 92.7 ...

### Source

October 2013 CPI data by the Office of National Statistics. Retrieved from "Consumer Price Inflation Reference Tables, October 2013" spreadsheet at:

<http://www.ons.gov.uk/ons/publications/re-reference-tables.html?edition=tcn>

### Examples

```
data(cpi)
```

---

dsplitnorm *The Split Normal Distribution (or 2 Piece Normal Distribution).*

---

### Description

Density, distribution function, quantile function and random generation for the split normal distribution with mode equal to mode, uncertainty indicator equal to sd and inverse skewness equal to skew.

### Usage

```
dsplitnorm(x, mode = 0, sd = 1, skew = 0, sd1 = NULL, sd2 = NULL)
psplitnorm(x, mode = 0, sd = 1, skew = 0, sd1 = NULL, sd2 = NULL)
qsplitnorm(p, mode = 0, sd = 1, skew = 0, sd1 = NULL, sd2 = NULL)
rsplitnorm(n, mode = 0, sd = 1, skew = 0, sd1 = NULL, sd2 = NULL)
```

**Arguments**

x	Vector of quantiles.
p	Vector of probabilities
n	Number of observations required.
mode	Vector of modes.
sd	Vector of uncertainty indicators.
skew	Vector of inverse skewness indicators. Must range between -1 and 1
sd1	Vector of standard deviations for left hand side. NULL by default.
sd2	Vector of standard deviations for right hand side. NULL by default.

**Details**

If mode, sd or skew are not specified they assume the default values of 0, 1 and 1, respectively. This results in identical values as a those obtained from a normal distribution.

The probability density function is:

$$f(x; \mu, \sigma_1, \sigma_2) = \frac{\sqrt{2}}{\sqrt{\pi}(\sigma_1 + \sigma_2)} e^{-\frac{1}{2\sigma_1^2}(x-\mu)^2}$$

for  $-\text{Inf} < x < \mu$ , and

$$f(x; \mu, \sigma_1, \sigma_2) = \frac{\sqrt{2}}{\sqrt{\pi}(\sigma_1 + \sigma_2)} e^{-\frac{1}{2\sigma_2^2}(x-\mu)^2}$$

for  $\mu < x < \text{Inf}$ , where, if not specified (in sd1 and sd2)  $\sigma_1$  and  $\sigma_2$  are derived as

$$\sigma_1 = \sigma / \sqrt{1 - \gamma}$$

$$\sigma_2 = \sigma / \sqrt{1 + \gamma}$$

from  $\sigma_1$  is the overall uncertainty indicator sd and  $\gamma$  is the inverse skewness indicator skew.

**Value**

dsplitnorm gives the density, psplitnorm gives the distribution function, qsplitnorm gives the quantile function, and rsplitnorm generates random deviates.

The length of the result is determined by n for rsplitnorm, and is the maximum of the lengths of the numerical parameters for the other functions.

The numerical parameters other than n are recycled to the length of the result.

**Note**

Tested against the fan chart package in MATLAB (<http://www.mathworks.de/matlabcentral/fileexchange/27702-fan-chart>). Obtained the same results for a set of simple comparisons.

**Author(s)**

space = if(style=="boxplot") 1/frequency else 0.9/frequency,
add = TRUE, ylim = range(data)*0.8, ...)

```

## Arguments

data	Set of sequential simulation data, where rows represent simulation number and columns represent some form of time index. If <code>data.type = "values"</code> , data must instead be a set of quantile values by rows for a set of probabilities (which need to be provided in <code>probs</code> and by column for some form of time index). Data can take multiple classes, where the contents are converted to a <code>matrix</code> . If the input is a <code>mts</code> or <code>zoo</code> , the time series properties will be inherited (and <code>start</code> and <code>frequency</code> arguments will be ignored).
data.type	Indicates if data are sets of pre-calculated values based for defined probabilities <code>data.type = "values"</code> or simulated data <code>data.type = "simulations"</code> . That later is the default.
style	Plot style, choose from <code>fan</code> (default), <code>spaghetti</code> boxplot or <code>boxfan</code> . See <code>Examples</code> and <code>Details</code> Sections for further explanation.
type	Type of percentiles to plot in <code>fan</code> or <code>boxfan</code> . Choose from, <code>percentile</code> (default) or <code>interval</code> .
probs	Probabilities related to percentiles or prediction intervals to be plotted (dependent on the <code>type</code> function). These values control the number of shades used in the <code>fan</code> or <code>boxfan</code> . These must be between 0 and 100 (inclusive) or 0 and 1.

	Percentiles greater than 50 (or 0.5), if not given, are automatically calculated as 100-p, to ensure symmetric fan. Values can be non-integers. Default to single percentile values when type="percentile" and the 50th, 80th and 95th prediction interval when type="interval" is set.
start	The time of the first distribution in sims. Similar to use in <a href="#">ts</a> .
frequency	The number of distribution in sims per unit of time in sims. Similar to use in <a href="#">ts</a> .
anchor	Optional data value to anchor a forecast fan on. Typically this will be the last observation of the observed data series.
anchor.time	Optional data value for the time of the anchor. Useful for irregular time series.
fan.col	Palette of colours used in the fan or boxfan.
n.fan	The number of colours to use in the fan.
alpha	Factor modifying the opacity alpha; typically in [0,1].
ln	Vector of number to plot contour lines on-top fan or boxfan. Must correspond to calculated percentiles in probs. By default for fan takes either every percentile or prediction interval given in the probs argument (if less than 10) or, when there are more than 10 probs passed, the either every decile or every prediction interval that are a multiple of 10 and given in probs. No lines plotted by default for fan0
med.ln	Add a median line to fan. Might be of particular use if type="interval". Only works when data.type = "simulations" and one of fan, boxfan or spaghetti styles.
ln.col	Line colour to be imposed on top of the fan. By default takes the darkest colour from fan.col argument, unless style="spaghetti"
med.col	Median Line colour. By default this is set to the first colour in fan.col. Users might wish to change to highlight the median.
r1ab	Vector of labels at the end (right) of corresponding percentiles or prediction intervals of the fan or boxfan. Must be in calculated in the probs argument. By default plotted alongside values provided to the ln argument.
rpos	Position of right labels for the fan or boxfan. See <a href="#">text</a> .
roffset	Offset of right labels for the fan or boxfan. See <a href="#">text</a> .
rcex	Text size of right labels for the fan or boxfan. See <a href="#">text</a> .
rcol	Colour of text for right labels for the fan or boxfan. See <a href="#">text</a> .
llab	Can take either 1) a TRUE or FALSE value to plot label at the start (right) of the corresponding percentiles or prediction intervals given in r1ab, default is FALSE or 2) a original vector of percentiles or prediction intervals. Must be in calculated in the probs argument. Only works for fan or boxfan styles.
lpos	Position of left labels for the fan or boxfan. See <a href="#">text</a> .
loffset	Offset of left labels for the fan or boxfan. By default takes the same value as roffset. See <a href="#">text</a> .
lcex	Text size of left labels for the fan or boxfan. By default takes the same value as rcex. See <a href="#">text</a> .

lcol	Colour of text for left labels for the fan or boxfan. By default takes the same value as rcol. See <a href="#">text</a> .
upplab	Prefix character string for upper labels to be used for the fan or boxfan when type="interval".
lowlab	Prefix character string for lower labels to be used for the fan or boxfan when type="interval".
medlab	Character string for median label.
n.spag	Number of simulations to plot in the spaghetti plot.
space	Space between boxes in the boxfan plot.
add	Add to active plot. By default FALSE for fan and TRUE for fan0.
ylim	Passed to plot when add = TRUE.
...	Additional arguments passed to <a href="#">boxplot</a> for fan and to <a href="#">plot</a> for fan0.

### Details

Visualise sequential distributions using a range of plotting styles. Sequential distribution data can be input as either simulations or pre-computed values over time (columns). For the later, the user should declare input data as percentiles by setting `data.type = "values"`. Plots are added to existing graphic devices. Users can choose from four different styles.

The fan and boxfan style plot distributions based on used-defined shading scheme, controlled by the `fan.col` argument. Additional lines and text are added to illustrate major contours on the probability distribution. Lines and labels can be suppressed by adding `ln = NULL` and `r1ab = NULL`. Labels to the left of the fan can also be specified using the `l1ab` argument. Colours are by default taken from the [heat.colors](#) palette. Alternatives can be specified using `fan.col` (see the example below). The joining of a forecast fan to data is controlled by the `anchor` argument.

The spaghetti style, plots random draws (when `data.type = "simulations"` is set) along the sequence of distributions. The number of draws is controlled by the `n.spag` argument. The transparency of the lines is controlled by `alpha`.

The boxplot style, adds a box plot for simulated data at the appropriate location, according to the `start` and `frequency` arguments. Gaps between box plots are controlled by `space` argument. Additional arguments are passed to [boxplot](#).

```

**Description**

Immigration, emigration and net migration flow counts (and their confidence intervals) for the UK from the International Passenger Survey (IPS) conducted by the Office of National Statistics. Data formatted from the 2012 release of the Long-Term International Migration Statistics.

**Usage**

```
data(ips)
```

**Format**

A data frame with 38 observations on the following 7 variables.

```
year a numeric vector
imm a numeric vector
imm.ci a numeric vector
emi a numeric vector
emi.ci a numeric vector
net a numeric vector
net.ci a numeric vector
```

**Details**

Data differ slightly from the final adjusted migration estimates published by the ONS, that take account of certain types of migration that the IPS doesn't pick up, such as asylum seekers, people migrating for longer or shorter than they thought they would, and migration over land to and from Northern Ireland.

**Source**

Annual statistics on flows of international migrants to and from the UK and England and Wales by the Office of National Statistics. Retrieved from "1.02 IPS Margins of Error, 1975-2012" spreadsheet at:

<http://www.ons.gov.uk/ons/publications/re-reference-tables.html?edition=tcn>

**Examples**

```
#standard plot
net<-ts(ips$net, start=1975)
plot(net, ylim=range(net-ips$net.ci, net+ips$net.ci))
lines(net+ips$net.ci, lty=2, col="red")
lines(net-ips$net.ci, lty=2, col="red")

#simulate values
ips.sim <- matrix(NA, nrow = 10000, ncol=length(net))
for (i in 1:length(net))
  ips.sim[, i] <- rnorm(10000, mean = ips$net[i], sd =ips$net.ci[i]/1.96)
```

```

#spaghetti plot
plot(net, ylim=range(net-ips$net.ci, net+ips$net.ci), type = "n")
fan(ips.sim, style="spaghetti", start=tsp(net)[1], n.spag=50)

#box plot
plot(net, ylim=range(net-ips$net.ci, net+ips$net.ci), type = "n")
fan(ips.sim, style="boxplot", start=tsp(net)[1], llab=TRUE, outline=FALSE)

#box fan
plot(net, ylim=range(net-ips$net.ci, net+ips$net.ci), type = "n")
fan(ips.sim, style="boxfan", type="interval", start=tsp(net)[1])

```

---

th.mcmc

*1000 MCMC Simulations of Estimated Volatility from Pound Dollar Exchange Rate Data.*

---

## Description

MCMC simulations of volatility obtained from the bugs function in the R2OpenBUGS package. Estimates based on the stochastic volatility model for Pound-Dollar exchange rate data presented in the appendix of Meyer and Yu (2002). The MCMC was ran for 1100 simulations, thinning to keep every 10th iteration, and treating the first 100 simulations as burn in.

Larger simulations (without thinning) can be obtained using the data (svpdx) and the my1.txt BUGS file contained in this package, see example below.

## Details

See Meyer and Yu (2010) for model specification.

Sturtz, S., U. Ligges, and A. Gelman (2005). R2WinBUGS: a package for running WinBUGS from R. *Journal of Statistical Software* 12 (3), 1–16.

## Examples

```

## Not run:
# empty plot
plot(NULL, type = "n", xlim = c(1, 945), ylim = range(th.mcmc), ylab = "Theta")

# add fan
fan(th.mcmc)

##
##Create your own (longer) MCMC sample:
##

```

```
library("tsbugs")
library("R2OpenBUGS")
# write model file:
my1.bug <- dget(system.file("model", "my1.R", package = "fanplot"))
write.model(my1.bug, "my1.txt")
# take a look:
file.show("my1.txt")
# run openbugs, remember to include theta as a param otherwise will not
# have anything to plot
my1.mcmc<-bugs(data=list(n=length(svpdx$px),y=svpx$px),
               inits=list(list(phistar=0.975,mu=0,itau2=50)),
               param=c("mu","phi","tau","theta"),
               model="my1.txt",
               n.iter=11000, n.burnin=1000, n.chains=1)

th.mcmc <- my1.mcmc$sims.list$theta

## End(Not run)
```
