

Package ‘gRain’

July 30, 2020

Version 1.3-6

Title Graphical Independence Networks

Author Søren Højsgaard <sorenh@math.aau.dk>

Maintainer Søren Højsgaard <sorenh@math.aau.dk>

Description Probability propagation in graphical independence networks, also known as Bayesian networks or probabilistic expert systems. Documentation of the package is provided in vignettes included in the package and in the paper by Højsgaard (2012, [doi:10.18637/jss.v046.i10](https://doi.org/10.18637/jss.v046.i10)). See 'citation(`gRain')' for details.

License GPL (>= 2)

Depends R (>= 3.6.0), methods, gRbase (>= 1.8.6.6)

Suggests microbenchmark, knitr, testthat (>= 2.1.0)

Imports graph, Rgraphviz, igraph, stats4, magrittr, Rcpp (>= 0.11.1)

chest*Chest clinic example*

Description

Conditional probability tables for the chest clinic example.

Usage

```
data(chest_cpt)
```

Format

An object of class list of length 8.

Examples

```
## 'data' generated with the following code fragment
yn   <- c("yes", "no")
a    <- cptable(~asia, values=c(1,99),levels=yn)
t.a <- cptable(~tub|asia, values=c(5,95,1,99),levels=yn)
s    <- cptable(~smoke, values=c(5,5), levels=yn)
l.s <- cptable(~lung|smoke, values=c(1,9,1,99), levels=yn)
b.s <- cptable(~bronc|smoke, values=c(6,4,3,7), levels=yn)
e.lt <- cptable(~either|lung:tub,values=c(1,0,1,0,1,0,0,1),levels=yn)
x.e <- cptable(~xray|either, values=c(98,2,5,95), levels=yn)
d.be <- cptable(~dysp|bronc:either, values=c(9,1,7,3,8,2,1,9), levels=yn)
```

```

grain(compileCPT(a, t.a, s, l.s, b.s, e.lt, x.e, d.be))

# 'data' generated from
# chest_cpt <- list(a, t.a, s, l.s, b.s, e.lt, x.e, d.be)

data(chest_cpt)

```

components_extract *Extract conditional probabilities and clique potentials from data.*

Description

Extract list of conditional probability tables and list of clique potentials from data.

Usage

```

extractCPT(data_, graph, smooth = 0)

extractPOT(data_, graph, smooth = 0)

extractMARG(data_, graph, smooth = 0)

marg2pot(mg)

pot2marg(pt)

```

Arguments

<code>data_</code>	A named array or a dataframe.
<code>graph</code>	A graphNEL object or a list or formula which can be turned into a graphNEL object by calling <code>ug</code> or <code>dag</code> . For <code>extractCPT</code> , <code>graph</code> must be/define a DAG while for <code>extractPOT</code> , <code>graph</code> must be/define undirected triangulated graph.
<code>smooth</code>	See 'details' below.
<code>mg</code>	An object of class <code>marg_rep</code>
<code>pt</code>	An object of class <code>pot_rep</code>

Details

If `smooth` is non-zero then `smooth` is added to all cell counts before normalization takes place.

Value

- `extractCPT`: A list of conditional probability tables.
- `extractPOT`: A list of clique potentials.
- `extractMARG`: A list of clique marginals.

[compileCPT](#), [compilePOT](#), [grain](#)

Examples

```
## Extract cpts / clique potentials from data and graph
# specification and create network. There are different ways:

data(lizard, package="gRbase")

# DAG: height <- species -> diam
dagG <- dag(~species + height:species + diam:species)

# UG : [height:species][diam:species]
uG <- ug(~height:species + diam:species)

pt <- extractPOT(lizard, ~height:species + diam:species)
cp <- extractCPT(lizard, ~species + height:species + diam:species)

pt
cp

# Both specify the same probability distribution
tabListMult(pt) %>% as.data.frame.table
tabListMult(cp) %>% as.data.frame.table

## Not run:
# Bayesian networks can be created as
bn.uG <- grain(pt)
bn.daG <- grain(cp)

# The steps above are wrapped into a convenience method which
# builds a network from at graph and data.
bn.uG <- grain(uG, data=lizard)
bn.daG <- grain(daG, data=lizard)

## End(Not run)
```

components_gather	<i>Compile conditional probability tables / cliques potentials.</i>
-------------------	---

Description

Compile conditional probability tables / cliques potentials as a preprocessing step for creating a graphical independence network

Usage

```
compileCPT(x, ..., forceCheck = TRUE)

compilePOT(x, ..., forceCheck = TRUE)

parse_cpt(xi)
```

Arguments

x	To compileCPT x is a list of conditional probability tables; to compilePOT, x is a list of clique potentials.
...	Additional arguments; currently not used.
forceCheck	Controls if consistency checks of the probability tables should be made.
xi	cpt in some representation

Details

- * `compileCPT` is relevant for turning a collection of cptable's into an object from which a network can be built. For example, when specification of a cpt is made with cptable then the levels of the node is given but not the levels of the parents. `compileCPT` checks that the levels of variables in the cpt's are consistent and also that the specifications define a dag.
- * `compilePOT` is not of direct relevance for the user for the moment. However, the elements of the input should be arrays which define a chordal undirected graph and the arrays should, if multiplied, form a valid probability density.

Value

A list with a class attribute.

## FIXME: compileCPT/compilePOT examples missing.
```

cpt-update

Update components of Bayesian network

Description

Update components of Bayesian network.

Usage

```
setCPT(object, value)

## S3 method for class 'cpt_grain'
setCPT(object, value)
```

Arguments

object	A <code>grain</code> object.
value	A named list, see examples below.

x
wet.bn <- grain(x)

getgrain(wet.bn, "cpt")
getgrain(wet.bn, "cpt")$R
getgrain(wet.bn, "cpt")$S

# Now update some cpt's
wet.bn2 <- setCPT(wet.bn, list(R=c(.3, .7), S=c(.1, .9, .7, .3)))

getgrain(wet.bn2, "cpt")$R
getgrain(wet.bn2, "cpt")$S
```

cptable

Create conditional probability tables (CPTs)

Description

Creates conditional probability tables of the form $p(v|pa(v))$.

Usage

```
cptable(vpar, levels = NULL, values = NULL, normalize = TRUE, smooth = 0)
```

Arguments

vpar	Specifications of the names in $P(v pa_1, \dots, pa_k)$. See section 'details' for information about the form of the argument.
levels	See 'details' below.
values	Probabilities; recycled if necessary. Regarding the order, please see section 'details' and the examples.
normalize	See 'details' below.
smooth	See 'details' below.

Details

If `normalize=TRUE` then the probabilities are normalized to sum to one for each configuration of the parents.

If `smooth` is non-zero then zero entries of values are replaced with `smooth` before normalization takes place.

Regarding the form of the argument `vpar`: To specify $P(a|b,c)$ one may write $\sim a|b:c$, $\sim a:b:c$, $\sim a|b+c$, $\sim a+b+c$ or `c("a", "b", "c")`. Internally, the last form is used. Notice that the + and : operator is used as a separator only. The order of the variables IS important so the operators DO NOT commute.

If `a` has levels `a1, a2` and likewise for `b` and `c` then the order of values corresponds to the configurations `(a1,b1,c1), (a2,b1,c1) (a1,b2,c1), (a2,b2,c1)` etc. That is, the first variable varies fastest. Hence the first two elements in `values` will be the conditional probabilities of a given `b=b1, c=c1`.

Value

A `cptable` object (a numeric vector with various attributes).

dim(p.G_SR) <- c(2, 2, 2)
dimnames(p.G_SR) <- ssp[c("G", "S", "R")]

# Arrays can be created (easier?) with parray() from gRbase
p.R   <- parray("R", levels=ssp, values=c(.2, .8))
p.S_R <- parray(c("S", "R"), levels = ssp, values=c(.01, .99, .4, .6))
p.G_SR <- parray(~ G:S:R, levels = ssp, values=c(.99, .01, .8, .2, .9, .1, 0, 1))

## End(Not run)

```

evidence_object*Evidence objects***Description**

Functions for defining and manipulating evidence.

Usage

```

new_ev(evi.list = NULL, levels)

is.null_ev(object)

## S3 method for class 'grain_ev'
as.data.frame(x, row.names = NULL, optional = FALSE, ...)

setdiff_ev(ev1, ev2)

union_ev(ev1, ev2)

```

Arguments

evi.list	A named list with evidence; see 'examples' below.
levels	A named list with the levels of all variables.
object	Some R object.
x	An evidence object.
row.names	Not used.
optional	Not used.
...	Not used.
ev1, ev2	Evidence.

Details

Evidence is specified as a list. Internally, evidence is represented as a grain evidence object which is a list with 4 elements.

Author(s)

Søren Højsgaard, <soren.hojsgaard@math.aau.dk>

Examples

```
## Define the universe

uni <- list(asia = c("yes", "no"), tub = c("yes", "no"), smoke = c("yes", "no"),
            lung = c("yes", "no"), bronc = c("yes", "no"), either = c("yes", "no"),
            xray = c("yes", "no"), dysp = c("yes", "no"))

e1 <- list(dysp="no", xray="no")
eo1 <- new_ev( e1, levels=uni )
eo1
as.data.frame( eo1 )
eo1 %>% str

e1.2 <- list(dysp="no", xray=c(0, 1))
eo1.2 <- new_ev( e1.2, levels=uni )
eo1.2

# Notice that in eo1.2, xray is not regarded as hard
# evidence but as a weight on each level. Other than that, eo1.2
# and eo1 are equivalent here. This is used in connection
# with specifying likelihood evidence.

e2 <- list(dysp="yes", asia="yes")
eo2 <- new_ev(e2, uni)

# If evidence 'e1' is already set in the network and new evidence
# 'e2' emerges, the evidence in the network must be updated. But
# there is a conflict in that dysp="yes" in 'e1' and
```

```
# dysp="no" in 'e2'. The (arbitrary) convention is that
# existing evidence overrides new evidence so that the only new
# evidence in 'e2' is really asia="yes".

# To subtract existing evidence from new evidence we can do:
setdiff_ev( eo2, eo1 )

# Likewise the 'union' is
union_ev( eo2, eo1 )
```

finding*Set, retrieve, and retract finding in Bayesian network.***Description**

Set, retrieve, and retract finding in Bayesian network. NOTICE: The functions described here are kept only for backward compatibility; please use the corresponding evidence-functions in the future.

Usage

```
setFinding(object, nodes = NULL, states = NULL, flist = NULL, propagate = TRUE)
```

Arguments

object	A "grain" object
nodes	A vector of nodes
states	A vector of states (of the nodes given by 'nodes')
flist	An alternative way of specifying findings, see examples below.
propagate	Should the network be propagated?

Note

NOTICE: The functions described here are kept only for backward compatibility; please use the corresponding evidence-functions in the future:

`setEvidence()` is an improvement of `setFinding()` (and as such `setFinding` is obsolete). Users are recommended to use `setEvidence()` in the future.

`setEvidence()` allows to specification of "hard evidence" (specific values for variables) and likelihood evidence (also known as virtual evidence) for variables.

The syntax of `setEvidence()` may change in the future.

bn2 <- retractFinding(bn2, nodes="asia")

getFinding(bn1)
getFinding(bn2)

pFinding(bn1)
pFinding(bn2)
```

Description

Generic functions etc for the gRain package

Usage

```
nodeNames(x)

## S3 method for class 'grain'
nodeNames(x)

nodeStates(x, nodes = nodeNames(x))

## S3 method for class 'grain'
nodeStates(x, nodes = nodeNames(x))

universe(object, ...)

## S3 method for class 'grain'
universe(object, ...)

## S3 method for class 'grainEvidence_'
varNames(x)

## S3 method for class 'grain'
rip(object, ...)

## S3 method for class 'cpt_spec'
vpar(object, ...)

## S3 method for class 'cpt_grain'
vpar(object, ...)
```

Arguments

x, object	A relevant object.
nodes	Some nodes of the object.
...	Additional arguments; currently not used.

Description

Creating grain objects (graphical independence network).

Usage

```

grain(x, ...)

## S3 method for class 'cpt_spec'
grain(x, control = list(), smooth = 0, compile = TRUE, details = 0, ...)

## S3 method for class 'CPTspec'
grain(x, control = list(), smooth = 0, compile = TRUE, details = 0, ...)

## S3 method for class 'pot_spec'
grain(x, control = list(), smooth = 0, compile = TRUE, details = 0, ...)

## S3 method for class 'graphNEL'
grain(
  x,
  control = list(),
  smooth = 0,
  compile = TRUE,
  details = 0,
  data = NULL,
  ...
)

## S3 method for class 'dModel'
grain(
  x,
  control = list(),
  smooth = 0,
  compile = TRUE,
  details = 0,
  data = NULL,
  ...
)

```

Arguments

x	An argument to build an independence network from. Typically a list of conditional probability tables, a DAG or an undirected graph. In the two latter cases, data must also be provided.
...	Additional arguments, currently not used.
control	A list defining controls, see 'details' below.
smooth	A (usually small) number to add to the counts of a table if the grain is built from a graph plus a dataset.
compile	Should network be compiled.
details	Debugging information.
data	An optional data set (currently must be an array/table)

Details

If 'smooth' is non-zero then entries of 'values' which are zero are replaced by the value of 'smooth' - BEFORE any normalization takes place.

Value

An object of class "grain"

Note

A change from earlier versions of this package is that grain objects are now compiled upon creation.

uG <- ug(~height:species + diam:species)

bn.uG <- grain(uG, data=lizard)
bn.daG <- grain(daG, data=lizard)
```

grain-simulate	<i>Simulate from an independence network</i>
-----------------------	--

Description

Simulate data from an independence network.

Usage

```
## S3 method for class 'grain'
simulate(object, nsim = 1, seed = NULL, ...)
```

Arguments

object	An independence network.
nsim	Number of cases to simulate.
seed	An optional integer controlling the random number generation.
...	Not used.

Value

A data frame

Søren Højsgaard (2012). Graphical Independence Networks with the gRain Package for R. Journal of Statistical Software, 46(10), 1-26. <http://www.jstatsoft.org/v46/i10/>.

Examples

```
tf <- system.file("huginex", "chest_clinic.net", package = "gRain")

chest <- loadHuginNet(tf, details=1)
simulate(chest,n=10)

chest2 <- setFinding(chest, c("VisitToAsia", "Dyspnoea"),
                      c("yes", "yes"))
simulate(chest2, n=10)
```

grain_compile	<i>Compile a graphical independence network (a Bayesian network)</i>
---------------	--

Description

Compiles a Bayesian network. This means creating a junction tree and establishing clique potentials; ; refer to the reference below for details.

Usage

```
## S3 method for class 'grain'
compile(
  object,
  propagate = FALSE,
  root = NULL,
  control = object$control,
  details = 0,
  ...
)
```

Arguments

object	A grain object.
propagate	If TRUE the network is also propagated meaning that the cliques of the junction tree are calibrated to each other.
root	A set of variables which must be in the root of the junction tree
control	Controlling the compilation process.
details	For debugging info. Do not use.
...	Currently not used.

Value

A compiled Bayesian network; an object of class `grain`.

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

References

Søren Højsgaard (2012). Graphical Independence Networks with the gRain Package for R. *Journal of Statistical Software*, 46(10), 1-26. <http://www.jstatsoft.org/v46/i10/>.

See Also

`grain`, `propagate`, `propagate.grain`, `triangulate`, `rip`, `junctionTree`

`grain_evidence` *Set, update and remove evidence.*

Description

Set, update and remove evidence.

Usage

```
setEvidence(
  object,
  nodes = NULL,
  states = NULL,
  evidence = NULL,
  nslist = NULL,
  propagate = TRUE,
  details = 0
)

retractEvidence(object, nodes = NULL, propagate = TRUE)

absorbEvidence(object, propagate = TRUE)

pEvidence(object)

getEvidence(object)

evidence(object)

## S3 method for class 'grain'
evidence(object)

evidence(object) <- value

## S3 replacement method for class 'grain'
evidence(object) <- value
```

Arguments

<code>object</code>	A "grain" object
<code>nodes</code>	A vector of nodes; those nodes for which the (conditional) distribution is requested.
<code>states</code>	A vector of states (of the nodes given by 'nodes')
<code>evidence</code>	An alternative way of specifying findings (evidence), see examples below.
<code>nslist</code>	deprecated

propagate	Should the network be propagated?
details	Debugging information
value	The evidence in the form of a named list or an evidence-object.

Value

A list of tables with potentials.

Note

`setEvidence()` is an improvement of `setFinding()` (and as such `setFinding` is obsolete). Users are recommended to use `setEvidence()` in the future.

`setEvidence()` allows to specification of "hard evidence" (specific values for variables) and likelihood evidence (also known as virtual evidence) for variables.

The syntax of `setEvidence()` may change in the future.

See Also

`setFinding`, `getFinding`, `retractFinding`, `pFinding`

Examples

```
data(chest_cpt)
chest.bn <- grain(compileCPT(chest_cpt))
chest.bn <- compile(chest.bn)

## 1) These two forms are identical
setEvidence(chest.bn, c("asia", "xray"), c("yes", "yes"))
setFinding(chest.bn, c("asia", "xray"), c("yes", "yes"))

## 2) Suppose we do not know with certainty whether a patient has
## recently been to Asia. We can then introduce a new variable
## "guess.asia" with "asia" as its only parent. Suppose
## p(guess.asia=yes|asia=yes)=.8 and p(guess.asia=yes|asia=no)=.1
## If the patient is e.g. unusually tanned we may set
## guess.asia=yes and propagate.
##
## This corresponds to modifying the model by the likelihood (0.8,
## 0.1) as
```

```
setEvidence(chest.bn, c("asia", "xray"), list(c(0.8, 0.1), "yes"))

## 3) Hence, the same result as in 1) can be obtained with
setEvidence(chest.bn, c("asia", "xray"), list(c(1, 0), "yes"))

## 4) An alternative specification using evidence is
setEvidence(chest.bn, evidence=list(asia=c(1, 0), xray="yes"))
```

grain_jevidence*Set joint evidence in grain objects***Description**

Setting and removing joint evidence in grain objects.

Usage

```
setJEvidence(object, evidence = NULL, propagate = TRUE, details = 0)

retractJEvidence(object, items = NULL, propagate = TRUE, details = 0)

new_jev(ev, levels)
```

Arguments

<code>object</code>	A "grain" object.
<code>evidence</code>	A list of evidence. Each element is a named array.
<code>propagate</code>	Should evidence be absorbed once entered; defaults to TRUE.
<code>details</code>	Amount of printing; for debugging.
<code>items</code>	Items in the evidence list to be removed. Here, <code>NULL</code> means remove everything, <code>0</code> means nothing is removed. Otherwise <code>items</code> is a numeric vector.
<code>ev</code>	A named list.
<code>levels</code>	A named list.

Note

All the joint evidence functionality should be used with great care.

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

Examples

```

data(chest_cpt)
chest.bn <- grain(compileCPT(chest_cpt))
chest.bn <- compile(chest.bn)

uni <- list(asia = c("yes", "no"), tub = c("yes", "no"),
            smoke = c("yes", "no"), lung = c("yes", "no"),
            bronc = c("yes", "no"), either = c("yes", "no"),
            xray = c("yes", "no"), dysp = c("yes", "no"))

ev <- list(tabNew("asia", levels=uni, values=c(1,0)),
           tabNew("dysp", levels=uni, values=c(1,0)),
           tabNew(c("dysp","bronc"), levels=uni, values=c(.1, .2, .9, .8)) )

chest.bn
chest.bn2 <- setJEvidence(chest.bn, evidence=ev)
chest.bn2

# Notice: The evidence is defined on (subsets of) cliques of the junction tree
# and therefore evidence can readily be absorbed:
getgrain(chest.bn, "rip")$cliques %>% str

# On the other hand, below is evidence which is not defined cliques
# of the junction tree and therefore evidence can not easily be
# absorbed. Hence this will fail:

## Not run:
ev.fail <- list(tab(c("dysp","smoke"), levels=uni, values=c(.1, .2, .9, .8)) )
setJEvidence(chest.bn, evidence=ev.fail)

## End(Not run)

## Evidence can be removed with

retractJEvidence(chest.bn2)      ## All evidence removed.
retractJEvidence(chest.bn2, 0)    ## No evidence removed.
retractJEvidence(chest.bn2, 1:2)  ## Evidence items 1 and 2 are removed.

# Setting additional joint evidence to an object where joint
# evidence already is set will cause an error. Hence this will fail:

## Not run:
ev2 <- list(smoke="yes")
setJEvidence(chest.bn2, evidence=ev2)

## End(Not run)

## Instead we can do
new.ev <- c(getEvidence(chest.bn2), list(smoke="yes"))
chest.bn
setJEvidence(chest.bn, evidence=new.ev)

```

```

## Create joint evidence object:
yn <- c("yes", "no")
db <- parray(c("dysp", "bronc"), list(yn, yn), values=c(.1, .2, .9, .8))
db
ev <- list(asia=c(1, 0), dysp="yes", db)

jevi <- new_jev(ev, levels=uni)
jevi

chest.bn3 <- setJEvidence(chest.bn, evidence=jevi)
evidence(chest.bn3)

```

grain_predict*Make predictions from a probabilistic network***Description**

Makes predictions (either as the most likely state or as the conditional distributions) of variables conditional on finding (evidence) on other variables in an independence network.

Usage

```

## S3 method for class 'grain'
predict(
  object,
  response,
  predictors = setdiff(names(newdata), response),
  newdata,
  type = "class",
  ...
)

```

Arguments

object	A grain object
response	A vector of response variables to make predictions on
predictors	A vector of predictor variables to make predictions from. Defaults to all variables that are note responses.
newdata	A data frame
type	If "class", the most probable class is returned; if "distribution" the conditional distribution is returned.
...	Not used

Value

A list with components

pred	A list with the predictions
pFinding	A vector with the probability of the finding (evidence) on which the prediction is based

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

References

[grain](#)

Examples

```
data(chest_cpt)
data(chestSim500)

chest.bn <- grain(compileCPT(chest_cpt))
nd <- chestSim500[1:4]

predict(chest.bn, response="bronc", newdata=nd)
predict(chest.bn, response="bronc", newdata=nd, type="distribution")
```

grain_propagate *Propagate a graphical independence network (a Bayesian network)*

Description

Propagation refers to calibrating the cliques of the junction tree so that the clique potentials are consistent on their intersections; refer to the reference below for details.

Usage

```
## S3 method for class 'grain'
propagate(object, details = object$details, engine = "cpp", ...)
propagateLS(cqpotList, rip, initialize = TRUE, details = 0)
```

Arguments

object	A grain object
details	For debugging info
engine	Either "R" or "cpp"; "cpp" is the default and the fastest.
...	Currently not used
cqpotList	Clique potential list
rip	A rip ordering
initialize	Always true

Details

The propagate method invokes propagateLS which is a pure R implementation of the Lauritzen-Spiegelhalter algorithm. The c++ based version is several times faster than the purely R based version.

Value

A compiled and propagated grain object.

Author(s)

Søren Højsgaard, <soren.hojsgaard@math.aau.dk>

[grain](#), [compile](#)

Examples

```
yn    <- c("yes", "no")
a     <- cptable(~asia,           values=c(1,99), levels=yn)
t.a   <- cptable(~tub+asia,      values=c(5,95,1,99), levels=yn)
s     <- cptable(~smoke,          values=c(5,5), levels=yn)
l.s   <- cptable(~lung+smoke,    values=c(1,9,1,99), levels=yn)
b.s   <- cptable(~bronnc+smoke,  values=c(6,4,3,7), levels=yn)
e.lt  <- cptable(~either+lung+tub, values=c(1,0,1,0,1,0,0,1), levels=yn)
x.e   <- cptable(~xray+either,   values=c(98,2,5,95), levels=yn)
d.be  <- cptable(~dysp+bronc+either, values=c(9,1,7,3,8,2,1,9), levels=yn)
chest.cpt <- compileCPT(list(a, t.a, s, l.s, b.s, e.lt, x.e, d.be))
chest.bn <- grain(chest.cpt)
bn1   <- compile(chest.bn, propagate=FALSE)
bn2   <- propagate(bn1)
bn3   <- compile(chest.bn, propagate=TRUE)
```

grass*Wet grass example*

Description

Conditional probability tables for the wet grass example.

Usage

```
data(grass_cpt)
```

Format

An object of class `list` of length 3.

Examples

```
## 'data' generated with the following code fragment
yn <- c("yes", "no")
p.R   <- cptable(~R, values=c(.2, .8), levels=yn)
p.S_R <- cptable(~S:R, values=c(.01, .99, .4, .6), levels=yn)
p.G_SR <- cptable(~G:S:R, values=c(.99, .01, .8, .2, .9, .1, 0, 1), levels=yn)

grain(compileCPT(p.R, p.S_R, p.G_SR))

# 'data' generated from
# grass_cpt <- list(p.R, p.S_R, p.G_SR)

data(grass_cpt)
```

load-save-hugin

Load and save Hugin net files

Description

These functions can load a net file saved in the 'Hugin format' into R and save a network in R as a file in the 'Hugin format'.

Usage

```
loadHuginNet(file, description = NULL, details = 0)

saveHuginNet(gin, file, details = 0)
```

Arguments

<code>file</code>	Name of HUGIN net file. Convenient to give the file the extension '.net'
<code>description</code>	A text describing the network, defaults to <code>file</code>
<code>details</code>	Debugging information
<code>gin</code>	An independence network

Value

An object of class `grain`.

Author(s)

Søren Højsgaard, <sorenh@math.aau.dk>

References

Søren Højsgaard (2012). Graphical Independence Networks with the gRain Package for R. Journal of Statistical Software, 46(10), 1-26. <http://www.jstatsoft.org/v46/i10/>.

[grain](#)

Examples

```
## Load HUGIN net file
tf <- system.file("huginex", "chest_clinic.net", package = "gRain")
chest <- loadHuginNet(tf, details=1)
chest

## Save a copy
td <- tempdir()
saveHuginNet(chest, paste(td,"/chest.net",sep=''))

## Load the copy
chest2 <- loadHuginNet(paste(td,"/chest.net",sep=''))

tf <- system.file("huginex", "golf.net", package = "gRain")
golf <- loadHuginNet(tf, details=1)

saveHuginNet(golf, paste(td,"/golf.net",sep=''))
golf2 <- loadHuginNet(paste(td,"/golf.net",sep=''))
```

logical

*Conditional probability tables based on logical dependencies***Description**

Generate conditional probability tables based on the logical expressions AND and OR.

Usage

```
booltab(vpa, levels = c(TRUE, FALSE), op = `&`)

andtab(vpa, levels = c(TRUE, FALSE))

ortab(vpa, levels = c(TRUE, FALSE))

andtable(vpa, levels = c(TRUE, FALSE))

ortable(vpa, levels = c(TRUE, FALSE))
```

Arguments

- | | |
|--------|---|
| vpa | Node and two parents; as a formula or a character vector. |
| levels | The levels (or rather labels) of v, see 'examples' below. |
| op | A logical operator. |

Details

Regarding the form of the argument vpa: To specify $P(a|b, c)$ one may write $\sim a|b+c$ or $\sim a+b+c$ or $\sim a|b:c$ or $\sim a:b:c$ or $c("a", "b", "c")$. Internally, the last form is used. Notice that the + and : operator are used as separators only. The order of the variables is important so + and : DO NOT commute.

Value

An array.

Note

`andtable` and `ortable` are aliases for `andtab` and `ortab` and are kept for backward compatibility.

References

Søren Højsgaard (2012). Graphical Independence Networks with the gRain Package for R. Journal of Statistical Software, 46(10), 1-26. <http://www.jstatsoft.org/v46/i10/>.

See Also[cptable](#)**Examples**

```

## Logical OR:

## A variable v is TRUE if either of its parents pa1 and pa2 are TRUE:
ortab( c("v", "pa1", "pa2") ) %>% ftable(row.vars="v")
## TRUE and FALSE can be recoded to e.g. yes and no:
ortab( c("v", "pa1", "pa2"), levels=c("yes", "no") ) %>% ftable(row.vars="v")

## Logical AND:

## Same story here:
andtab(c("v", "pa1", "pa2") ) %>% ftable(row.vars="v")
andtab(c("v", "pa1", "pa2"), levels=c("yes", "no") ) %>% ftable(row.vars="v")

## Combined approach

booltab(c("v", "pa1", "pa2"), op='&') %>% ftable(row.vars="v") ## AND
booltab(c("v", "pa1", "pa2"), op='|') %>% ftable(row.vars="v") ## OR

booltab(~v + pa1 + pa2, op='&') %>% ftable(row.vars="v") ## AND
booltab(~v + pa1 + pa2, op='|') %>% ftable(row.vars="v") ## OR

```

mendel

*Mendelian segregation***Description**

Generate conditional probability table for mendelian segregation.

Usage

```
mendel(allele, names = c("child", "father", "mother"))
```

Arguments

- | | |
|--------|--------------------------------|
| allele | A character vector. |
| names | Names of columns in dataframe. |

Note

No error checking at all on the input.

Examples

```
## Inheritance of the alleles "y" and "g"

men <- mendel(c("y","g"), names=c("ch", "fa", "mo"))
men
```

querygrain

Query a network

Description

Query an independence network, i.e. obtain the conditional distribution of a set of variables - possibly (and typically) given finding (evidence) on other variables.

Usage

```
querygrain(
  object,
  nodes = nodeNames(object),
  type = "marginal",
  evidence = NULL,
  exclude = TRUE,
  normalize = TRUE,
  result = "array",
  details = 0
)
```

Arguments

<code>object</code>	A grain object.
<code>nodes</code>	A vector of nodes; those nodes for which the (conditional) distribution is requested.
<code>type</code>	Valid choices are "marginal" which gives the marginal distribution for each node in nodes; "joint" which gives the joint distribution for nodes and "conditional" which gives the conditional distribution for the first variable in nodes given the other variables in nodes.
<code>evidence</code>	An alternative way of specifying findings (evidence), see examples below.
<code>exclude</code>	If TRUE then nodes on which evidence is given will be excluded from nodes (see above).
<code>normalize</code>	Should the results be normalized to sum to one.
<code>result</code>	If "data.frame" the result is returned as a data frame (or possibly as a list of dataframes).
<code>details</code>	Debugging information

Value

A list of tables with potentials.

Note

`setEvidence()` is an improvement of `setFinding()` (and as such `setFinding` is obsolete). Users are recommended to use `setEvidence()` in the future.

`setEvidence()` allows to specification of "hard evidence" (specific values for variables) and likelihood evidence (also known as virtual evidence) for variables.

The syntax of `setEvidence()` may change in the future.

`setEvidence`, `getEvidence`, `retractEvidence`, `pEvidence`

Examples

```
testfile <- system.file("huginex", "chest_clinic.net", package = "gRain")
chest <- loadHuginNet(testfile, details=0)
qb <- querygrain(chest)
qb

lapply(qb, as.numeric) # Safe
sapply(qb, as.numeric) # Risky
```

Description

Repeated patterns is a useful model specification short cut for Bayesian networks

Usage

```
repeatPattern(plist, instances, unlist = TRUE)
```

Arguments

plist	A list of conditional probability tables. The variable names must have the form name[i] and the i will be substituted by the values given in instances below.
instances	A vector of distinct integers
unlist	If FALSE the result is a list in which each element is a copy of plist in which name[i] are substituted. If TRUE the result is the result of applying unlist().
