

Package ‘ggiraph’

July 1, 2020

Type Package

Title Make 'ggplot2' Graphics Interactive

Description Create interactive 'ggplot2' graphics using 'htmlwidgets'.

Version 0.7.8

License GPL-3

Copyright See file COPYRIGHTS.

Encoding UTF-8

SystemRequirements C++11

Imports grid, ggplot2 (>= 3.3.0), htmlwidgets (>= 0.6), stats,
htmltools, Rcpp (>= 0.12.12), gdtools (>= 0.2.1), purrr, rlang,
uuid

LinkingTo Rcpp, gdtools

Suggests knitr, testthat, rmarkdown, maps, shiny, sf (>= 0.7-3),
quantreg, xml2 (>= 1.0.0), dplyr

VignetteBuilder knitr

annotate_interactive *Create interactive annotations*

Description

The layer is based on [annotate\(\)](#). See the documentation for that function for more details.

Usage

`annotate_interactive(...)`

Arguments

... arguments passed to base function, plus any of the [interactive_parameters\(\)](#).

Details for `annotate_*_interactive` functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

See Also

[girafe\(\)](#), [interactive_parameters\(\)](#), [annotation_raster_interactive\(\)](#)

Examples

```
# add interactive annotation to a ggplot -----
library(ggplot2)
library(ggiraph)

gg <- ggplot(mtcars, aes(x = disp, y = qsec )) +
  geom_point(size=2) +
  annotate_interactive(
    "rect", xmin = 100, xmax = 400, fill = "red",
    data_id = "an_id", tooltip = "a tooltip",
    ymin = 18, ymax = 20, alpha = .5)

x <- girafe(ggobj = gg, width_svg = 5, height_svg = 4)
if( interactive() ) print(x)
```

```
annotation_raster_interactive
    Create interactive raster annotations
```

Description

The layer is based on [annotation_raster\(\)](#). See the documentation for that function for more details.

Usage

```
annotation_raster_interactive(...)
```

Arguments

... arguments passed to base function, plus any of the [interactive_parameters\(\)](#)..

Details for annotate_*_interactive functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

See Also

[girafe\(\)](#)

Examples

```
# add interactive raster annotation to a ggplot -----
library(ggplot2)
library(ggiraph)

# Generate data
rainbow <- matrix(hcl(seq(0, 360, length.out = 50 * 50), 80, 70), nrow = 50)

p <- ggplot(mtcars, aes(mpg, wt)) +
  geom_point() +
  annotation_raster_interactive(rainbow, 15, 20, 3, 4, tooltip = "I am an image!")
x <- girafe(ggobj = p)
if( interactive() ) print(x)

# To fill up whole plot
p <- ggplot(mtcars, aes(mpg, wt)) +
  annotation_raster_interactive(rainbow, -Inf, Inf, -Inf, Inf, tooltip = "I am an image too!") +
  geom_point()
x <- girafe(ggobj = p)
if( interactive() ) print(x)
```

dsvg*SVG Graphics Driver***Description**

This function produces SVG files (compliant to the current w3 svg XML standard) where elements can be made interactive.

Usage

```
dsvg(
  file = "Rplots.svg",
  width = 6,
  height = 6,
  bg = "white",
  pointsize = 12,
  standalone = TRUE,
  setdims = TRUE,
  canvas_id = "svg_1",
  fonts = list()
)
```

Arguments

<code>file</code>	the file where output will appear.
<code>height, width</code>	Height and width in inches.
<code>bg</code>	Default background color for the plot (defaults to "white").
<code>pointsize</code>	default point size.
<code>standalone</code>	Produce a stand alone svg file? If FALSE, omits xml header and default namespace.
<code>setdims</code>	If TRUE (the default), the svg node will have attributes width & height set
<code>canvas_id</code>	svg id within HTML page.
<code>fonts</code>	Named list of font names to be aliased with fonts installed on your system. If unspecified, the R default families sans, serif, mono and symbol are aliased to the family returned by match_family() .

See Also

[Devices](#)

Examples

```
fileout <- tempfile(fileext = ".svg")
dsvg(file = fileout)
plot(rnorm(10), main="Simple Example", xlab = "", ylab = "")
dev.off()
```

dsvg_view*Run plotting code and view svg in RStudio Viewer or web browser.*

Description

This is useful primarily for testing. Requires the `htmltools` package.

Usage

```
dsvg_view(code, ...)
```

Arguments

code	Plotting code to execute.
...	Other arguments passed on to <code>dsvg</code> .

Examples

```
dsvg_view(plot(1:10))
dsvg_view(hist(rnorm(100)))
```

element_interactive*Create interactive theme elements*

Description

With these functions the user can add interactivity to various `theme` elements.

They are based on `element_rect()`, `element_line()` and `element_text()` See the documentation for those functions for more details.

Usage

```
element_line_interactive(...)
element_rect_interactive(...)
element_text_interactive(...)
```

Arguments

...	arguments passed to base function, plus any of the <code>interactive_parameters()</code> .
-----	--

Details for *element_**_{interactive} functions

The interactive parameters can be supplied as arguments in the relevant function and they should be scalar values.

For theme text elements (`element_text_interactive()`), the interactive parameters can also be supplied while setting a label value, via the `labs()` family of functions or when setting a scale/guide title or key label. Instead of setting a character value for the element, function `label_interactive()` can be used to define interactive parameters to go along with the label. When the parameters are supplied that way, they override the default values that are set at the theme via `element_text_interactive()` or via the guide's theme parameters.

[girafe\(\)](#)

Examples

```
# add interactive theme elements -----
library(ggplot2)
library(ggiraph)

dataset <- structure(list(qsec = c(16.46, 17.02, 18.61, 19.44, 17.02, 20.22
), disp = c(160, 160, 108, 258, 360, 225), carname = c("Mazda RX4",
"Mazda RX4 Wag", "Datsun 710", "Hornet 4 Drive", "Hornet Sportabout",
"Valiant"), wt = c(2.62, 2.875, 2.32, 3.215, 3.44, 3.46)), row.names = c("Mazda RX4",
"Mazda RX4 Wag", "Datsun 710", "Hornet 4 Drive", "Hornet Sportabout",
"Valiant"), class = "data.frame")

# plots
gg_point = ggplot(data = dataset) +
  geom_point_interactive(aes(
    x = wt,
    y = qsec,
    color = disp,
    tooltip = carname,
    data_id = carname
  )) +
  theme_minimal() +
  theme(
    plot.title = element_text_interactive(
      data_id = "plot.title",
      tooltip = "plot title",
      hover_css = "fill:red;stroke:none;font-size:12pt"
    ),
    plot.subtitle = element_text_interactive(
      data_id = "plot.subtitle",
      tooltip = "plot subtitle",
      hover_css = "fill:none;"
    ),
    axis.title.x = element_text_interactive(
      data_id = "axis.title.x",
      tooltip = "Description for x axis",
      
```

```

        hover_css = "fill:red;stroke:none;"  

    ),  

    axis.title.y = element_text_interactive(  

        data_id = "axis.title.y",  

        tooltip = "Description for y axis",  

        hover_css = "fill:red;stroke:none;"  

    ),  

    panel.grid.major = element_line_interactive(  

        data_id = "panel.grid",  

        tooltip = "Major grid lines",  

        hover_css = "fill:none;stroke:red;"  

    )  

) +  

labs(  

    title = "Interactive points example!",  

    subtitle = label_interactive(  

        "by ggiraph",  

        tooltip = "Click me!",  

        onclick = "window.open(\"https://davidgohel.github.io/ggiraph/\")",  

        hover_css = "fill:magenta;cursor:pointer;"  

    )  

)  

  

x <- girafe(ggobj = gg_point)  

if( interactive() ) print(x)

```

geom_abline_interactive*Create interactive reference lines***Description**

These geometries are based on [geom_abline\(\)](#), [geom_hline\(\)](#) and [geom_vline\(\)](#).

Usage

```

geom_abline_interactive(...)

geom_hline_interactive(...)

geom_vline_interactive(...)

```

Arguments

... arguments passed to base function, plus any of the [interactive_parameters\(\)](#).

Details for geom_*_interactive functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the `geom_*_interactive` function. In this way they can be set to a scalar value.

geom_density_interactive*Create interactive smoothed density estimates***Description**

The geometry is based on [geom_density\(\)](#). See the documentation for those functions for more details.

Usage

```
geom_density_interactive(...)
```

Arguments

...	arguments passed to base function, plus any of the interactive_parameters() .
-----	---

Details for geom_*_interactive functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via [aes\(\)](#)). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

See Also

x <- girafe(ggobj = g)
if( interactive() ) print(x)
```

`geom_freqpoly_interactive`

Create interactive histograms and frequency polygons

Description

The geometries are based on `geom_histogram()` and `geom_freqpoly()`. See the documentation for those functions for more details.

This interactive version is only providing a single tooltip per group of data (same for `data_id`). It means it is only possible to associate a single tooltip to a set of bins.

Usage

```
geom_freqpoly_interactive(...)
geom_histogram_interactive(...)
```

Arguments

... arguments passed to base function, plus any of the `interactive_parameters()`.

Details for geom_*_interactive functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the `geom_*_interactive` function. In this way they can be set to a scalar value.

`girafe()`

Examples

```
# add interactive histogram -----
library(ggplot2)
library(ggiraph)

p <- ggplot(diamonds, aes(carat)) +
  geom_histogram_interactive(bins=30, aes(tooltip = ..count..,
                                             data_id = carat) )
x <- girafe(ggobj = p)
if( interactive() ) print(x)

p <- ggplot(diamonds, aes(price, colour = cut, tooltip = cut, data_id = cut)) +
  geom_freqpoly_interactive(binwidth = 500)
x <- girafe(ggobj = p)
x <- girafe_options(x = x,
                      opts_hover(css = "stroke-width:3px;") )
if( interactive() ) print(x)
```

geom_jitter_interactive

Create interactive jittered points

Description

The geometry is based on `geom_jitter()`. See the documentation for those functions for more details.

Usage

`geom_jitter_interactive(...)`

Arguments

... arguments passed to base function, plus any of the `interactive_parameters()`.

Details for geom_*_interactive functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via [aes\(\)](#)). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

x <- girafe(ggobj = gg)
if( interactive() ) print(x)
```

geom_rect_interactive *Create interactive rectangles*

Description

These geometries are based on `geom_rect()` and `geom_tile()`. See the documentation for those functions for more details.

Usage

```
geom_rect_interactive(...)
```

```
geom_tile_interactive(...)
```

Arguments

... arguments passed to base function, plus any of the `interactive_parameters()`.

Details for geom_*_interactive functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the `geom_*_interactive` function. In this way they can be set to a scalar value.

Note

Converting a raster to svg elements could inflate dramatically the size of the svg and make it unreadable in a browser. Function `geom_tile_interactive` should be used with caution, total number of rectangles should be small.

geom_ribbon_interactive*Create interactive ribbons and area plots***Description**

The geometries are based on [geom_ribbon\(\)](#) and [geom_area\(\)](#). See the documentation for those functions for more details.

Usage

```
geom_ribbon_interactive(...)
geom_area_interactive(...)
```

Arguments

... arguments passed to base function, plus any of the [interactive_parameters\(\)](#).

Details for geom_*_interactive functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via [aes\(\)](#)). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

See Also

[girafe\(\)](#)

Examples

```
# add interactive bar -----
library(ggplot2)
library(ggiraph)

# Generate data
huron <- data.frame(year = 1875:1972, level = as.vector(LakeHuron))
h <- ggplot(huron, aes(year))

g <- h +
  geom_ribbon_interactive(aes(ymin = level - 1, ymax = level + 1),
                         fill = "grey70", tooltip = "ribbon1", data_id="ribbon1",
```

```

outline.type = "both",
hover_css = "stroke:red;stroke-width:inherit;" + 
geom_line_interactive(aes(y = level), tooltip = "level", data_id="line1",
                      hover_css = "stroke:orange;fill:none;")
x <- girafe(ggobj = g)
x <- girafe_options(x = x,
                     opts_hover(css = girafe_css(
                       css = "stroke:orange;stroke-width:3px;",
                       area = "fill:blue;"))
                     )))

```

ggiraph*Create a ggiraph object***Description**

Create an interactive graphic to be used in a web browser.

This function is maintained for backward compatibility reasons, user shoud now use function [girafe\(\)](#) and [girafe_options](#).

Usage

```

ggiraph(
  code,
  ggobj = NULL,
  pointsize = 12,
  width = 0.75,
  width_svg = 6,
  height_svg = 5,
  tooltip_extra_css = NULL,
  hover_css = NULL,
  tooltip_opacity = 0.9,
  tooltip_offx = 10,
  tooltip_offy = 0,
  tooltip_zindex = 999,
  zoom_max = 1,
  selection_type = "multiple",
  selected_css = NULL,
  dep_dir = NULL,
  ...
)

```

Arguments

code	Plotting code to execute
ggobj	ggplot object to print. argument code will be ignored if this argument is supplied.
pointsize	the default pointsize of plotted text in pixels, default to 12.
width	widget width ratio ($0 < \text{width} \leq 1$).
width_svg	The width and height of the graphics region in inches. The default values are 6 and 5 inches. This will define the aspect ratio of the graphic as it will be used to define viewbox attribute of the SVG result.
height_svg	The width and height of the graphics region in inches. The default values are 6 and 5 inches. This will define the aspect ratio of the graphic as it will be used to define viewbox attribute of the SVG result.
tooltip_extra_css	extra css (added to <code>position: absolute; pointer-events: none;</code>) used to customize tooltip area.
hover_css	css to apply when mouse is hover and element with a <code>data-id</code> attribute.
tooltip_opacity	tooltip opacity
tooltip_offx	tooltip x offset
tooltip_offy	tooltip y offset
tooltip_zindex	tooltip css z-index, default to 999.
zoom_max	maximum zoom factor
selection_type	row selection mode ("single", "multiple", "none") when widget is in a Shiny application.
selected_css	css to apply when element is selected (shiny only).
dep_dir	Deprecated; the path where the output files are stored. If <code>NULL</code> , the current path for temporary files is used.
...	arguments passed on to dsvg

Examples

```
# ggiraph simple example -----
library(ggplot2)
library(ggiraph)

dataset <- structure(list(qsec = c(16.46, 17.02, 18.61, 19.44, 17.02, 20.22
), disp = c(160, 160, 108, 258, 360, 225), carname = c("Mazda RX4",
"Mazda RX4 Wag", "Datsun 710", "Hornet 4 Drive", "Hornet Sportabout",
"Valiant"), wt = c(2.62, 2.875, 2.32, 3.215, 3.44, 3.46)), row.names = c("Mazda RX4",
"Mazda RX4 Wag", "Datsun 710", "Hornet 4 Drive", "Hornet Sportabout",
"Valiant"), class = "data.frame")
dataset

# plots
gg_point = ggplot(data = dataset) +
  geom_point_interactive(aes(x = wt, y = qsec, color = disp,
```

```
tooltip = carname, data_id = carname)) + theme_minimal()

x <- girafe(ggobj = gg_point)
if( interactive() ) print(x)
```

ggiraphOutput *Create a ggiraph output element*

Description

Render a ggiraph within an application page.

Usage

```
ggiraphOutput(outputId, width = "100%", height = "500px")
```

Arguments

outputId	output variable to read the ggiraph from.
width	widget width
height	widget height

Examples

```
## Not run:
if( require(shiny) && interactive() ){
  app_dir <- file.path( system.file(package = "ggiraph"), "examples/shiny/cars" )
  shinyAppDir(appDir = app_dir )
}
if( require(shiny) && interactive() ){
  app_dir <- file.path( system.file(package = "ggiraph"), "examples/shiny/crimes" )
  shinyAppDir(appDir = app_dir )
}

## End(Not run)
```

girafe *Create a girafe object*

Description

Create an interactive graphic with a ggplot object to be used in a web browser. The function should replace function `ggiraph`.

Usage

```
girafe(
  code,
  ggobj = NULL,
  pointsize = 12,
  width_svg = 6,
  height_svg = 5,
  options = list(),
  ...
)
```

Arguments

code	Plotting code to execute
ggobj	ggplot objet to print. argument code will be ignored if this argument is supplied.
pointsize	the default pointsize of plotted text in pixels, default to 12.
width_svg, height_svg	The width and height of the graphics region in inches. The default values are 6 and 5 inches. This will define the aspect ratio of the graphic as it will be used to define viewBox attribute of the SVG result.
options	a list of options for girafe rendering, see opts_tooltip , opts_hover , opts_selection , ...
...	arguments passed on to dsvg

Details

Use `geom_***_interactive` to create interactive graphical elements.

Difference from original functions is that some extra aesthetics are understood: the [interactive_parameters\(\)](#).

Tooltips can be displayed when mouse is over graphical elements.

If id are associated with points, they get animated when mouse is over and can be selected when used in shiny apps.

On click actions can be set with javascript instructions. This option should not be used simultaneously with selections in Shiny applications as both features are "on click" features.

When a zoom effect is set, "zoom activate", "zoom deactivate" and "zoom init" buttons are available in a toolbar.

When selection type is set to 'multiple' (in Shiny applications), lasso selection and lasso anti-selections buttons are available in a toolbar.

Widget options

girafe animations can be customized with function [girafe_options](#). Options are available to customize tooltips, hover effects, zoom effects selection effects and toolbar.

Widget sizing

girafe graphics are responsive, which mean, they will be resized according to their container. There are two responsive behavior implementations: one for Shiny applications and flexdashboard documents and one for other documents (i.e. R markdown and `saveWidget`).

Graphics are created by an R graphic device (i.e pdf, png, svg here) and need arguments width and height to define a graphic region. Arguments `width_svg` and `height_svg` are used as corresponding values. They are defining the aspect ratio of the graphic. This proportion is always respected when the graph is displayed.

When a girafe graphic is in a Shiny application, graphic will be resized according to the arguments `width` and `height` of the function `girafeOutput`. Default values are '100\ outer bounding box of the graphic (the HTML element that will contain the graphic with an aspect ratio).

When a girafe graphic is in an R markdown document (producing an HTML document), the graphic will be resized according to the argument `width` of the function `girafe`. Its value is beeing used to define a relative width of the graphic within its HTML container. Its height is automatically adjusted regarding to the argument `width` and the aspect ratio.

If this behavior does not fit with your need, I recommand you to use package `widgetframe` that wraps `htmlwidgets` inside a responsive iframe.

[girafe_options](#)

Examples

```
library(ggplot2)

dataset <- mtcars
dataset$carname = row.names(mtcars)

gg_point = ggplot( data = dataset,
  mapping = aes(x = wt, y = qsec, color = disp,
  tooltip = carname, data_id = carname) ) +
  geom_point_interactive() + theme_minimal()

x <- girafe(ggobj = gg_point, width = 0.7)

if(interactive()){
  print(x)
}
```

`girafeOutput`

Create a girafe output element

Description

Render a girafe within an application page.

Usage

```
girafeOutput(outputId, width = "100%", height = "500px")
```

Arguments

outputId	output variable to read the girafe from. Do not use special JavaScript characters such as a period . in the id, this would create a JavaScript error.
width	widget width
height	widget height

girafe_css*CSS creation helper*

Description

It allows specifying individual styles for various SVG elements.

Usage

```
girafe_css(  
  css,  
  text = NULL,  
  point = NULL,  
  line = NULL,  
  area = NULL,  
  image = NULL  
)
```

Arguments

css	The generic css style
text	Override style for text elements (svg:text)
point	Override style for point elements (svg:circle)
line	Override style for line elements (svg:line, svg:polyline)
area	Override style for area elements (svg:rect, svg:polygon, svg:path)
image	Override style for image elements (svg:image)

Value

css as scalar character

Examples

```
library(ggiraph)

girafe_css(
  css = "fill:orange;stroke:gray;",
  text = "stroke:none; font-size: larger",
  line = "fill:none",
  area = "stroke-width:3px",
  point = "stroke-width:3px",
  image = "outline:2px red"
)
```

girafe_options *Set girafe options*

Description

Defines the animation options related to a [girafe\(\)](#) object.

Usage

```
girafe_options(x, ...)
```

Arguments

- x girafe object.
- ... set of options defined by calls to `opts_*` functions or to `sizingPolicy` from html-widgets (this won't have any effect within a shiny context).

See Also

[girafe\(\)](#)

Other girafe animation options: [opts_hover\(\)](#), [opts_selection\(\)](#), [opts_sizing\(\)](#), [opts_toolbar\(\)](#), [opts_tooltip\(\)](#), [opts_zoom\(\)](#)

Examples

```
library(ggplot2)
library(htmlwidgets)

dataset <- mtcars
dataset$carname = row.names(mtcars)

gg_point = ggplot( data = dataset,
  mapping = aes(x = wt, y = qsec, color = disp,
  tooltip = carname, data_id = carname) ) +
  geom_point_interactive() + theme_minimal()
```

```

x <- girafe(ggobj = gg_point)
x <- girafe_options(x = x,
  opts_tooltip(opacity = .7),
  opts_zoom(min = .5, max = 4),
  sizingPolicy(defaultWidth = "100%", defaultHeight = "300px"),
  opts_hover(css = "fill:red;stroke:orange;r:5pt;" ) )

if(interactive()){
  print(x)
}

```

guide_bins_interactive*Create interactive bins guide***Description**

The guide is based on [guide_bins\(\)](#). See the documentation for that function for more details.

Usage

```
guide_bins_interactive(...)
```

Arguments

... arguments passed to base function.

Value

An interactive guide object.

Details for scale_interactive and guide_interactive functions

For scales, the interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors, depending on the number of breaks (levels) and the type of the guide used. The guides do not accept any interactive parameter directly, they receive them from the scales.

- When guide of type legend or bins is used, it will be converted to a [guide_legend_interactive\(\)](#) or [guide_bins_interactive\(\)](#) respectively, if it's not already.

The length of each scale interactive parameter vector should match the length of the breaks. It can also be a named vector, where each name should correspond to the same break name. It can also be defined as function that takes the breaks as input and returns a named or unnamed vector of values as output.

The interactive parameters here, give interactivity only to the key elements of the guide.

- When guide of type colourbar or coloursteps is used, it will be converted to a [guide_colourbar_interactive\(\)](#) or [guide_coloursteps_interactive\(\)](#) respectively, if it's not already.

The scale interactive parameters in this case should be scalar values and give interactivity to the colorbar only.

To provide interactivity to the rest of the elements of a guide, (title, labels, background, etc), the relevant theme elements or relevant guide arguments can be used. The guide arguments `title.theme` and `label.theme` can be defined as `element_text_interactive` (in fact, they will be converted to that if they are not already), either directly or via the theme. See the `element_*_interactive` section for more details.

guide_coloursteps_interactive*Create interactive colorsteps guide***Description**

The guide is based on [guide_coloursteps\(\)](#). See the documentation for that function for more details.

Usage

```
guide_coloursteps_interactive(...)
guide_colorsteps_interactive(...)
```

Arguments

... arguments passed to base function.

Value

An interactive guide object.

Details for scale_interactive and guide_interactive functions

For scales, the interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors, depending on the number of breaks (levels) and the type of the guide used. The guides do not accept any interactive parameter directly, they receive them from the scales.

- When guide of type legend or bins is used, it will be converted to a [guide_legend_interactive\(\)](#) or [guide_bins_interactive\(\)](#) respectively, if it's not already.

The length of each scale interactive parameter vector should match the length of the breaks. It can also be a named vector, where each name should correspond to the same break name. It can also be defined as function that takes the breaks as input and returns a named or unnamed vector of values as output.

The interactive parameters here, give interactivity only to the key elements of the guide.

- When guide of type colourbar or coloursteps is used, it will be converted to a [guide_colourbar_interactive\(\)](#) or [guide_coloursteps_interactive\(\)](#) respectively, if it's not already.

The scale interactive parameters in this case should be scalar values and give interactivity to the colorbar only.

To provide interactivity to the rest of the elements of a guide, (title, labels, background, etc), the relevant theme elements or relevant guide arguments can be used. The guide arguments `title.theme` and `label.theme` can be defined as `element_text_interactive` (in fact, they will be converted to that if they are not already), either directly or via the theme. See the `element_*_interactive` section for more details.

interactive_parameters*Interactive parameters***Description**

Throughout ggiraph there are functions that add interactivity to ggplot plot elements. The user can control the various aspects of interactivity by supplying a special set of parameters to these functions.

Arguments

tooltip	Tooltip text to associate with one or more elements. If this is supplied a tooltip is shown when the element is hovered. Plain text or html is supported.
onclick	Javascript code to associate with one or more elements. This code will be executed when the element is clicked.
hover_css	Individual css style associate with one or more elements. This css style is applied when the element is hovered and overrides the default style, set via <code>opts_hover()</code> or <code>opts_hover_key()</code> .
selected_css	Individual css style associate with one or more elements. This css style is applied when the element is selected and overrides the default style, set via <code>opts_selection()</code> or <code>opts_selection_key()</code> .
data_id	Identifier to associate with one or more elements. This is mandatory parameter if hover and selection interactivity is desired. Identifiers are available as reactive input values in Shiny applications.

Details for geom_ *_interactive functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the `geom_ *_interactive` function. In this way they can be set to a scalar value.

Details for annotate_ *_interactive functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

Details for scale_interactive and guide_interactive functions

For scales, the interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors, depending on the number of breaks (levels) and the type of the guide used. The guides do not accept any interactive parameter directly, they receive them from the scales.

- When guide of type legend or bins is used, it will be converted to a `guide_legend_interactive()` or `guide_bins_interactive()` respectively, if it's not already.

The length of each scale interactive parameter vector should match the length of the breaks. It can also be a named vector, where each name should correspond to the same break name. It can also be defined as function that takes the breaks as input and returns a named or unnamed vector of values as output.

The interactive parameters here, give interactivity only to the key elements of the guide.

- When guide of type colourbar or coloursteps is used, it will be converted to a `guide_colourbar_interactive()` or `guide_coloursteps_interactive()` respectively, if it's not already.

The scale interactive parameters in this case should be scalar values and give interactivity to the colorbar only.

To provide interactivity to the rest of the elements of a guide, (title, labels, background, etc), the relevant theme elements or relevant guide arguments can be used. The guide arguments `title.theme` and `label.theme` can be defined as `element_text_interactive` (in fact, they will be converted to that if they are not already), either directly or via the theme. See the `element_*_interactive` section for more details.

Details for element_*_interactive functions

The interactive parameters can be supplied as arguments in the relevant function and they should be scalar values.

For theme text elements (`element_text_interactive()`), the interactive parameters can also be supplied while setting a label value, via the `labs()` family of functions or when setting a scale/guide title or key label. Instead of setting a character value for the element, function `label_interactive()` can be used to define interactive parameters to go along with the label. When the parameters are supplied that way, they override the default values that are set at the theme via `element_text_interactive()` or via the guide's theme parameters.

Details for interactive_*_grob functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

`label_interactive` *Create an interactive label*

Description

This function returns an object that can be used as a label via the `labs()` family of functions or when setting a scale/guide name/title or key label. It passes the interactive parameters to a theme element created via `element_text_interactive` or via an interactive guide.

Usage

```
label_interactive(label, ...)
```

Arguments

<code>label</code>	The text for the label (scalar character)
<code>...</code>	any of the <code>interactive_parameters()</code> .

Value

an interactive label object

`opts_hover` *Hover effect settings*

Description

Allows customization of the rendering of graphic elements when the user hovers over them with the cursor (mouse pointer). Use `opts_hover` for interactive geometries in panels, `opts_hover_key` for interactive scales/guides and `opts_hover_theme` for interactive theme elements. Use `opts_hover_inv` for the effect on the rest of the geometries, while one is hovered (inverted operation).

Usage

```
opts_hover(css = NULL, reactive = FALSE)

opts_hover_inv(css = NULL)

opts_hover_key(css = NULL, reactive = FALSE)

opts_hover_theme(css = NULL, reactive = FALSE)
```

Arguments

<code>css</code>	css to associate with elements when they are hovered. It must be a scalar character. It can also be constructed with girafe_css , to give more control over the css for different element types.
<code>reactive</code>	if TRUE, in Shiny context, hovering will set Shiny input values.

Other girafe animation options: [girafe_options\(\)](#), [opts_selection\(\)](#), [opts_sizing\(\)](#), [opts_toolbar\(\)](#), [opts_tooltip\(\)](#), [opts_zoom\(\)](#)

Examples

```
library(ggplot2)

dataset <- mtcars
dataset$carname = row.names(mtcars)

gg <- ggplot(
  data = dataset,
  mapping = aes(x = wt, y = qsec, color = disp,
                 tooltip = carname, data_id = carname) ) +
  geom_point_interactive() + theme_minimal()

x <- girafe(ggobj = gg)
x <- girafe_options(x,
                     opts_hover(css = "fill:wheat;stroke:orange;r:5pt;") )
if( interactive() ) print(x)
```

<code>opts_selection</code>	<i>Selection effect settings</i>
-----------------------------	----------------------------------

Description

Allows customization of the rendering of selected graphic elements. Use `opts_selection` for interactive geometries in panels, `opts_selection_key` for interactive scales/guides and `opts_selection_theme` for interactive theme elements.

Usage

```
opts_selection(
  css = NULL,
  type = "multiple",
  only_shiny = TRUE,
  selected = character(0)
)

opts_selection_key(
  css = NULL,
  type = "single",
  only_shiny = TRUE,
  selected = character(0)
)

opts_selection_theme(
  css = NULL,
  type = "single",
  only_shiny = TRUE,
  selected = character(0)
)
```

Arguments

<code>css</code>	css to associate with elements when they are selected. It must be a scalar character. It can also be constructed with girafe_css , to give more control over the css for different element types.
<code>type</code>	selection mode ("single", "multiple", "none") when widget is in a Shiny application.
<code>only_shiny</code>	disable selections if not in a shiny context.
<code>selected</code>	character vector, id to be selected when the graph will be initialized.

Other girafe animation options: [girafe_options\(\)](#), [opts_hover\(\)](#), [opts_sizing\(\)](#), [opts_toolbar\(\)](#), [opts_tooltip\(\)](#), [opts_zoom\(\)](#)

Examples

```
library(ggplot2)

dataset <- mtcars
dataset$carname = row.names(mtcars)

gg <- ggplot(
  data = dataset,
  mapping = aes(x = wt, y = qsec, color = disp,
    tooltip = carname, data_id = carname) ) +
```

```
geom_point_interactive() + theme_minimal()

x <- girafe(ggobj = gg)
x <- girafe_options(x,
  opts_selection(type = "multiple",
    css = "fill:red;stroke:gray;r:5pt;") )
if( interactive() ) print(x)
```

opts_sizing*Girafe sizing settings*

Description

Allows customization of the svg style sizing

Usage

```
opts_sizing(rescale = TRUE, width = 1)
```

Arguments

- | | |
|---------|--|
| rescale | if FALSE, graphic will not be resized and the dimensions are exactly those of the container. |
| width | widget width ratio (0 < width <= 1). |

Other girafe animation options: [girafe_options\(\)](#), [opts_hover\(\)](#), [opts_selection\(\)](#), [opts_toolbar\(\)](#), [opts_tooltip\(\)](#), [opts_zoom\(\)](#)

Examples

```
library(ggplot2)

dataset <- mtcars
dataset$carname = row.names(mtcars)

gg <- ggplot(
  data = dataset,
  mapping = aes(x = wt, y = qsec, color = disp,
    tooltip = carname, data_id = carname) ) +
  geom_point_interactive() + theme_minimal()

x <- girafe(ggobj = gg)
x <- girafe_options(x,
  opts_sizing(rescale = FALSE) )
if( interactive() ) print(x)
```

opts_toolbar*Toolbar settings*

Description

Allows customization of the toolbar

Usage

```
opts_toolbar(position = "topright", saveaspng = TRUE, pngname = "diagram")
```

Arguments

- | | |
|-----------|--|
| position | one of 'top', 'bottom', 'topleft', 'topright', 'bottomleft', 'bottomright' |
| saveaspng | set to TRUE to propose the 'save as png' button. |
| pngname | the default basename (without .png extension) to use for the png file. |

Note

saveaspng relies on JavaScript promises, so any browsers that don't natively support the standard Promise object will need to have a polyfill (e.g. Internet Explorer with version less than 11 will need it).

if( interactive() ) print(x)
```

opts_tooltip	<i>Tooltip settings</i>
--------------	-------------------------

Description

Settings to be used with [girafe\(\)](#) for tooltip customisation.

Usage

```
opts_tooltip(  
  css = NULL,  
  offx = 10,  
  offy = 0,  
  use_cursor_pos = TRUE,  
  opacity = 0.9,  
  use_fill = FALSE,  
  use_stroke = FALSE,  
  delay_mouseover = 200,  
  delay_mouseout = 500,  
  zindex = 999  
)
```

Arguments

css	extra css (added to position: absolute; pointer-events: none;) used to customize tooltip area.
offx, offy	tooltip x and y offset
use_cursor_pos	should the cursor position be used to position tooltip (in addition to offx and offy). Setting to TRUE will have no effect in the RStudio browser windows.
opacity	tooltip background opacity
use_fill, use_stroke	logical, use fill and stroke properties to color tooltip.
delay_mouseover	The duration in milliseconds of the transition associated with tooltip display.
delay_mouseout	The duration in milliseconds of the transition associated with tooltip end of display.
zindex	tooltip css z-index, default to 999.

renderggiraph*Reactive version of ggiraph object***Description**

Makes a reactive version of a ggiraph object for use in Shiny.

Usage

```
renderggiraph(expr, env = parent.frame(), quoted = FALSE)
```

Arguments

- | | |
|--------|--|
| expr | An expression that returns a ggiraph object. |
| env | The environment in which to evaluate expr. |
| quoted | Is expr a quoted expression |

Examples

```

## Not run:
if( require(shiny) && interactive() ){
  app_dir <- file.path( system.file(package = "ggiraph"), "examples/shiny" )
  shinyAppDir(appDir = app_dir )
}

## End(Not run)

```

renderGirafe*Reactive version of girafe***Description**

Makes a reactive version of girafe object for use in Shiny.

Usage

```
renderGirafe(expr, env = parent.frame(), quoted = FALSE)
```

Arguments

<code>expr</code>	An expression that returns a <code>girafe()</code> object.
<code>env</code>	The environment in which to evaluate <code>expr</code> .
<code>quoted</code>	Is <code>expr</code> a quoted expression

`run_girafe_example` *Run shiny examples and see corresponding code*

Description

Run shiny examples and see corresponding code

Usage

```
run_girafe_example(name = "crimes")
```

Arguments

<code>name</code>	an application name, one of cars, click_scale, crimes, DT, dynamic_ui, iris, maps and modal.
-------------------	--

`scale_alpha_interactive`
Create interactive scales for alpha transparency

Description

These scales are based on `scale_alpha()`, `scale_alpha_continuous()`, `scale_alpha_discrete()`, `scale_alpha_ordinal()`, `scale_alpha_date()`, `scale_alpha_datetime()`. See the documentation for those functions for more details.

Usage

```
scale_alpha_interactive(...)

scale_alpha_continuous_interactive(...)

scale_alpha_discrete_interactive(...)

scale_alpha_ordinal_interactive(...)

scale_alpha_date_interactive(...)

scale_alpha_datetime_interactive(...)
```

Arguments

... arguments passed to base function, plus any of the [interactive_parameters\(\)](#).

Value

An interactive scale object.

Details for scale_interactive and guide_interactive functions

For scales, the interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors, depending on the number of breaks (levels) and the type of the guide used. The guides do not accept any interactive parameter directly, they receive them from the scales.

- When guide of type legend or bins is used, it will be converted to a [guide_legend_interactive\(\)](#) or [guide_bins_interactive\(\)](#) respectively, if it's not already.
The length of each scale interactive parameter vector should match the length of the breaks. It can also be a named vector, where each name should correspond to the same break name. It can also be defined as function that takes the breaks as input and returns a named or unnamed vector of values as output.
The interactive parameters here, give interactivity only to the key elements of the guide.
- When guide of type colourbar or coloursteps is used, it will be converted to a [guide_colourbar_interactive\(\)](#) or [guide_coloursteps_interactive\(\)](#) respectively, if it's not already.
The scale interactive parameters in this case should be scalar values and give interactivity to the colorbar only.

To provide interactivity to the rest of the elements of a guide, (title, labels, background, etc), the relevant theme elements or relevant guide arguments can be used. The guide arguments `title.theme` and `label.theme` can be defined as `element_text_interactive` (in fact, they will be converted to that if they are not already), either directly or via the theme. See the `element_*_interactive` section for more details.

Create your own interactive discrete scale

Description

These scales are based on `scale_colour_manual()`, `scale_fill_manual()`, `scale_size_manual()`, `scale_shape_manual()`, `scale_linetype_manual()`, `scale_alpha_manual()` and `scale_discrete_manual()`. See the documentation for those functions for more details.

Usage

```
scale_colour_manual_interactive(...)  
scale_color_manual_interactive(...)  
scale_fill_manual_interactive(...)  
scale_size_manual_interactive(...)  
scale_shape_manual_interactive(...)  
scale_linetype_manual_interactive(...)  
scale_alpha_manual_interactive(...)  
scale_discrete_manual_interactive(...)
```

Arguments

... arguments passed to base function, plus any of the [interactive_parameters\(\)](#).

Value

An interactive scale object.

Details for `scale_interactive` and `guide_interactive` functions

For scales, the interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors, depending on the number of breaks (levels) and the type of the guide used. The guides do not accept any interactive parameter directly, they receive them from the scales.

- When guide of type legend or bins is used, it will be converted to a [guide_legend_interactive\(\)](#) or [guide_bins_interactive\(\)](#) respectively, if it's not already. The length of each scale interactive parameter vector should match the length of the breaks. It can also be a named vector, where each name should correspond to the same break name. It can also be defined as function that takes the breaks as input and returns a named or unnamed vector of values as output. The interactive parameters here, give interactivity only to the key elements of the guide.
- When guide of type colourbar or coloursteps is used, it will be converted to a [guide_colourbar_interactive\(\)](#) or [guide_coloursteps_interactive\(\)](#) respectively, if it's not already. The scale interactive parameters in this case should be scalar values and give interactivity to the colorbar only.

To provide interactivity to the rest of the elements of a guide, (title, labels, background, etc), the relevant theme elements or relevant guide arguments can be used. The guide arguments `title.theme` and `label.theme` can be defined as `element_text_interactive` (in fact, they will be converted to that if they are not already), either directly or via the theme. See the `element_*_interactive` section for more details.

scale_shape_interactive*Create interactive scales for shapes***Description**

These scales are based on [scale_shape\(\)](#), [scale_shape_continuous\(\)](#), [scale_shape_discrete\(\)](#), [scale_shape_binned\(\)](#) and [scale_shape_ordinal\(\)](#). See the documentation for those functions for more details.

Usage

```
scale_shape_interactive(...)
```

```
scale_shape_continuous_interactive(...)  
scale_shape_discrete_interactive(...)  
scale_shape_binned_interactive(...)  
scale_shape_ordinal_interactive(...)
```

Arguments

... arguments passed to base function, plus any of the [interactive_parameters\(\)](#).

Value

An interactive scale object.

Details for scale_interactive and guide_interactive functions

For scales, the interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors, depending on the number of breaks (levels) and the type of the guide used. The guides do not accept any interactive parameter directly, they receive them from the scales.

- When guide of type legend or bins is used, it will be converted to a [guide_legend_interactive\(\)](#) or [guide_bins_interactive\(\)](#) respectively, if it's not already.

The length of each scale interactive parameter vector should match the length of the breaks. It can also be a named vector, where each name should correspond to the same break name. It can also be defined as function that takes the breaks as input and returns a named or unnamed vector of values as output.

The interactive parameters here, give interactivity only to the key elements of the guide.

- When guide of type colourbar or coloursteps is used, it will be converted to a [guide_colourbar_interactive\(\)](#) or [guide_coloursteps_interactive\(\)](#) respectively, if it's not already.

The scale interactive parameters in this case should be scalar values and give interactivity to the colorbar only.

To provide interactivity to the rest of the elements of a guide, (title, labels, background, etc), the relevant theme elements or relevant guide arguments can be used. The guide arguments `title.theme` and `label.theme` can be defined as `element_text_interactive` (in fact, they will be converted to that if they are not already), either directly or via the theme. See the `element_*_interactive` section for more details.
