

Package ‘hmlasso’

August 3, 2019

Type Package

Title Lasso with High Missing Rate

Version 0.0.1

Description A simple implementation of HMLasso (Lasso with High Missing rate).

Takada, M., Fujisawa, H., & Nishikawa, T. (2019) <[arXiv:1811.00255](https://arxiv.org/abs/1811.00255)>.

`cv.hmlasso`*Fit a model using a design matrix with cross validation*

Description

Fit a model using a design matrix with cross validation

Usage

```
cv.hmlasso(X, y, nfolds = 10, lambda.min.ratio = 0.01, nlambda = 100,
            lambda = NULL, foldid = NULL, unit = "sample", seed = 0,
            min_eig_th = 1e-06, use = "pairwise.complete.obs",
            impute_method = "mean", direct_prediction = FALSE,
            adjust_by_tr = FALSE, positify = "diag", weight_power = 1,
            mu = 1, eig_tol = 1e-08, eig_maxitr = 1e+08, verbose = FALSE,
            ...)
```

Arguments

<code>X</code>	matrix of explanatory variables
<code>y</code>	vector of objective variable
<code>nfolds</code>	the number of folds (ignored if foldid is specified)
<code>lambda.min.ratio</code>	ratio of max lambda and min lambda (ignored if lambda is specified)
<code>nlambda</code>	the number of lambda (ignored if lambda is specified)
<code>lambda</code>	lambda sequence
<code>foldid</code>	vector indicating id of fold for each sample
<code>unit</code>	unit for cross validation error: "sample" (default) or "fold"
<code>seed</code>	random seed of cross validation
<code>min_eig_th</code>	minimum eigenvalue
<code>use</code>	method to calculate correlation matrix from missing data (default "pairwise.complete.obs")
<code>impute_method</code>	imputation method for predictions
<code>direct_prediction</code>	either corrected cross validation is used or not
<code>adjust_by_tr</code>	whether mean (or median) of training data for prediction is used or not
<code>positify</code>	method for solving PSD matrix
<code>weight_power</code>	weighting power (default 0 meaning no-weighting)
<code>mu</code>	augmented Lagrangian parameter
<code>eig_tol</code>	tol parameter in eigs_sym function
<code>eig_maxitr</code>	maxitr parameter in eigs_sym
<code>verbose</code>	whether output verbose warnings and messages (default FALSE)
<code>...</code>	parameters of hmlasso function

Value

lasso model	
fit	lasso model with hole data
lambda.min	lambda with minimum cross validation error
lambda.min.index	index of lambda.min
lambda.1se	largest lambda such that error is within 1 standard error of the minimum
lambda.1se.index	index of lambda.1se
foldid	fold id
cve	cross validation error
cvse	cross validation standard error
cvup	cross validation error + standard error
cvlo	cross validation error - standard error
pe	prediction error (for family="binomial")

Examples

```
X_incompl <- as.matrix(iris[, 1:3])
X_incompl[1:5,1] <- NA
X_incompl[6:10,2] <- NA
y <- iris[, 4]
cv_fit <- cv.hmlasso(X_incompl, y, nlambda=50, lambda.min.ratio=1e-2)
plot(cv_fit)
plot(cv_fit$fit)
```

hmlasso*Fit a model using a design matrix***Description**

Fit a model using a design matrix

Usage

```
hmlasso(X, y, family = "gaussian", impl = "cpp",
lambda.min.ratio = 0.01, nlambda = 100, lambda = NULL,
min_eig_th = 1e-06, use = "pairwise.complete.obs",
positify = "diag", weight_power = 1, eig_tol = 1e-08,
eig_maxitr = 1e+08, mu = 1, verbose = FALSE, ...)
```

Arguments

<code>X</code>	matrix of explanatory variables
<code>y</code>	vector of objective variable
<code>family</code>	family of regression: "gaussian" (default) or "binomial"
<code>impl</code>	implementation language of optimization (only "cpp" is supported)
<code>lambda.min.ratio</code>	ratio of max lambda and min lambda (ignored if lambda is specified)
<code>nlambda</code>	the number of lambda (ignored if lambda is specified)
<code>lambda</code>	lambda sequence
<code>min_eig_th</code>	threshold of the minimum eigenvalue in the PSD matrix problem.
<code>use</code>	method to calculate correlation matrix from missing data (default "pairwise.complete.obs")
<code>positify</code>	method for solving PSD matrix
<code>weight_power</code>	weighting power (default 0 meaning no-weighting)
<code>eig_tol</code>	tol parameter in eigs_sym function
<code>eig_maxitr</code>	maxitr parameter in eigs_sym
<code>mu</code>	augmented Lagrangian parameter
<code>verbose</code>	whether output verbose warnings and messages (default FALSE)
<code>...</code>	parameters for optimization

Value

lasso model	
<code>beta</code>	coefficients
<code>beta_standard</code>	standardized coefficients
<code>a0</code>	intercepts
<code>lambda</code>	regularization parameters
<code>family</code>	family

Examples

```
X_incompl <- as.matrix(iris[, 1:3])
X_incompl[1:5,1] <- NA
X_incompl[6:10,2] <- NA
y <- iris[, 4]
fit <- hmlasso(X_incompl, y, nlambda=50, lambda.min.ratio=1e-2)
plot(fit)
```

plot.cv.hmlasso	<i>Plot a cross validation error path</i>
-----------------	---

Description

Plot a cross validation error path

Usage

```
## S3 method for class 'cv.hmlasso'  
plot(x, xlim = NULL, ylim = NULL, ...)
```

Arguments

x	cross validated hmlasso model
xlim	x range
ylim	y range
...	parameters of

Examples

```
X_incompl <- as.matrix(iris[, 1:3])  
X_incompl[1:5,1] <- NA  
X_incompl[6:10,2] <- NA  
y <- iris[, 4]  
cv_fit <- cv.hmlasso(X_incompl, y, nlambda=50, lambda.min.ratio=1e-2)  
plot(cv_fit)  
plot(cv_fit$fit)
```

plot.hmlasso	<i>Plot a solution path</i>
--------------	-----------------------------

Description

Plot a solution path

Usage

```
## S3 method for class 'hmlasso'  
plot(x, xlim = NULL, ylim = NULL, ...)
```

Arguments

x	hmlasso model
xlim	x range
ylim	y range
...	parameters of matlines function

Examples

```
X_incompl <- as.matrix(iris[, 1:3])
X_incompl[1:5,1] <- NA
X_incompl[6:10,2] <- NA
y <- iris[, 4]
fit <- hmlasso(X_incompl, y, nlambda=50, lambda.min.ratio=1e-2)
plot(fit)
```

predict.hmlasso *Predict responses*

Description

Predict responses

Usage

```
## S3 method for class 'hmlasso'
predict(object, newx, s = NULL,
        impute_method = "mean", adjust_by_tr = FALSE, ...)
```

Arguments

object	hmlasso model
newx	matrix of explanatory variables
s	selected lambda (default: all)
impute_method	imputation method for predictions (default: "mean")
adjust_by_tr	whether mean (or median) of training data for prediction is used or not
...	parameters of predict function

Examples

```
X_incompl <- as.matrix(iris[, 1:3])
X_incompl[1:5,1] <- NA
X_incompl[6:10,2] <- NA
y <- iris[, 4]
cv_fit <- cv.hmlasso(X_incompl, y, nlambda=50, lambda.min.ratio=1e-2)
predict(cv_fit$fit, X_incompl)
```
