

Package ‘ingredients’

July 29, 2020

Title Effects and Importances of Model Ingredients

Version 1.3.1

Description Collection of tools for assessment of feature importance and feature effects.

Key functions are:

feature_importance() for assessment of global level feature importance,
ceteris_paribus() for calculation of the what-if plots,
partial_dependence() for partial dependence plots,
conditional_dependence() for conditional dependence plots,
accumulated_dependence() for accumulated local effects plots,
aggregate_profiles() and cluster_profiles() for aggregation of ceteris paribus profiles,
generic_print() and plot() for better usability of selected explainers,
generic_plotD3() for interactive, D3 based explanations, and
generic_describe() for explanations in natural language.

The package 'ingredients' is a part of the 'DrWhy.AI' universe (Biecek 2018) <arXiv:1806.08915>.

Depends R (>= 3.5)

 accumulated_dependence

Accumulated Local Effects Profiles aka ALEPlots

Description

Accumulated Local Effects Profiles accumulate local changes in Ceteris Paribus Profiles. Function `accumulated_dependence` calls `ceteris_paribus` and then `aggregate_profiles`.

Usage

```
accumulated_dependence(x, ...)
```

```
## S3 method for class 'explainer'
```

```
accumulated_dependence(
  x,
  variables = NULL,
  N = 500,
  variable_splits = NULL,
  grid_points = 101,
  ...,
  variable_type = "numerical"
)
```

```
## Default S3 method:
```

```
accumulated_dependence(
  x,
  data,
  predict_function = predict,
  label = class(x)[1],
  variables = NULL,
  N = 500,
  variable_splits = NULL,
  grid_points = 101,
  ...,
  variable_type = "numerical"
)
```

```
## S3 method for class 'ceteris_paribus_explainer'
```

```
accumulated_dependence(x, ..., variables = NULL)
```

```
accumulated_dependency(x, ...)
```

Arguments

`x` an explainer created with function `DALEX::explain()`, an object of the class `ceteris_paribus_explainer` or a model to be explained.

...	other parameters
variables	names of variables for which profiles shall be calculated. Will be passed to <code>calculate_variable_split</code> . If NULL then all variables from the validation data will be used.
N	number of observations used for calculation of partial dependence profiles. By default, 500 observations will be chosen randomly.
variable_splits	named list of splits for variables, in most cases created with <code>calculate_variable_split</code> . If NULL then it will be calculated based on validation data available in the explainer.
grid_points	number of points for profile. Will be passed to <code>calculate_variable_split</code> .
variable_type	a character. If "numerical" then only numerical variables will be calculated. If "categorical" then only categorical variables will be calculated.
data	validation dataset Will be extracted from x if it's an explainer NOTE: It is best when target variable is not present in the data
predict_function	predict function Will be extracted from x if it's an explainer
label	name of the model. By default it's extracted from the class attribute of the model

Details

Find more details in the [Accumulated Local Dependence Chapter](#).

Value

an object of the class `aggregated_profiles_explainer`

References

ALEPlot: Accumulated Local Effects (ALE) Plots and Partial Dependence (PD) Plots <https://cran.r-project.org/package=ALEPlot>, Explanatory Model Analysis. Explore, Explain and Examine Predictive Models. <https://pbiecek.github.io/ema>

Examples

```
library("DALEX")

model_titanic_glm <- glm(survived ~ gender + age + fare,
                        data = titanic_imputed, family = "binomial")

explain_titanic_glm <- explain(model_titanic_glm,
                              data = titanic_imputed[,-8],
                              y = titanic_imputed[,8],
                              verbose = FALSE)

adp_glm <- accumulated_dependence(explain_titanic_glm,
                                 N = 25, variables = c("age", "fare"))

head(adp_glm)
```

```
plot(adp_glm)

library("randomForest")

model_titanic_rf <- randomForest(survived ~., data = titanic_imputed)

explain_titanic_rf <- explain(model_titanic_rf,
                             data = titanic_imputed[,-8],
                             y = titanic_imputed[,8],
                             verbose = FALSE)

adp_rf <- accumulated_dependence(explain_titanic_rf, N = 200, variable_type = "numerical")
plot(adp_rf)

adp_rf <- accumulated_dependence(explain_titanic_rf, N = 200, variable_type = "categorical")
plotD3(adp_rf, label_margin = 80, scale_plot = TRUE)
```

aggregate_profiles *Aggregates Ceteris Paribus Profiles*

Description

The function `aggregate_profiles()` calculates an aggregate of ceteris paribus profiles. It can be: Partial Dependence Profile (average across Ceteris Paribus Profiles), Conditional Dependence Profile (local weighted average across Ceteris Paribus Profiles) or Accumulated Local Dependence Profile (cummulated average local changes in Ceteris Paribus Profiles).

Usage

```
aggregate_profiles(
  x,
  ...,
  variable_type = "numerical",
  groups = NULL,
  type = "partial",
  variables = NULL,
  span = 0.25,
  center = FALSE
)
```

Arguments

`x` a ceteris paribus explainer produced with function `ceteris_paribus()`
`...` other explainers that shall be calculated together

```

plot(cp_rf, variables = "age") +
  show_observations(cp_rf, variables = "age") +
  show_rugs(cp_rf, variables = "age", color = "red") +
  show_aggregated_profiles(pdp_rf, size = 3, color = "_label_")

# categorical variable
pdp_rf_p <- aggregate_profiles(cp_rf, variables = "class",
                              variable_type = "categorical", type = "partial")
pdp_rf_p$`_label_` <- "RF_partial"
pdp_rf_c <- aggregate_profiles(cp_rf, variables = "class",
                              variable_type = "categorical", type = "conditional")
pdp_rf_c$`_label_` <- "RF_conditional"
pdp_rf_a <- aggregate_profiles(cp_rf, variables = "class",
                              variable_type = "categorical", type = "accumulated")
pdp_rf_a$`_label_` <- "RF_accumulated"
plot(pdp_rf_p, pdp_rf_c, pdp_rf_a, color = "_label_")

# or maybe flipped?
library(ggplot2)
plot(pdp_rf_p, pdp_rf_c, pdp_rf_a, color = "_label_") + coord_flip()

pdp_rf <- aggregate_profiles(cp_rf, variables = "class", variable_type = "categorical",
                             groups = "gender")

head(pdp_rf)
plot(pdp_rf, variables = "class")
# or maybe flipped?
plot(pdp_rf, variables = "class") + coord_flip()

```

bind_plots

Bind Multiple ggplot Objects

Description

This is an aesthetically efficient implementation of the [grid.arrange](#)

Usage

```
bind_plots(..., byrow = FALSE)
```

Arguments

... (ggplot) ggplot objects to combine.

byrow (logical) if FALSE (the default) the plots are bind by columns, otherwise the plots are bind by rows.

Value

(gtable) A plottable object with plot().

Author(s)

<https://github.com/harell>

Examples

```
library("DALEX")
titanic_glm <- glm(survived ~ gender + age + fare,
                  data = titanic_imputed, family = "binomial")

explain_glm <- explain(titanic_glm,
                      data = titanic_imputed,
                      y = titanic_imputed$survived,
                      verbose = FALSE)

pdp_numerical <- partial_dependence(explain_glm, N = 50, variable_type = "numerical")
pdp_categorical <- partial_dependence(explain_glm, N = 50, variable_type = "categorical")

# Bind plots by rows
bind_plots(plot(pdp_numerical), plot(pdp_categorical), byrow = TRUE)

# Bind plots by columns
bind_plots(plot(pdp_numerical), plot(pdp_categorical), byrow = FALSE)
```

calculate_oscillations

Calculate Oscillations for Ceteris Paribus Explainer

Description

Oscillations are proxies for local feature importance at the instance level. Find more details in [Ceteris Paribus Oscillations Chapter](#).

Usage

```
calculate_oscillations(x, sort = TRUE, ...)
```

Arguments

x	a ceteris_paribus explainer produced with the ceteris_paribus() function
sort	a logical value. If TRUE then rows are sorted along the oscillations
...	other arguments

Value

an object of the class `ceteris_paribus_oscillations`

References

Explanatory Model Analysis. Explore, Explain and Examine Predictive Models. <https://pbiecek.github.io/ema>

Examples

```
library("DALEX")
# smaller data, quicker example
titanic_small <- select_sample(titanic_imputed, n = 500, seed = 1313)

# build a model
model_titanic_glm <- glm(survived ~ gender + age + fare,
                        data = titanic_small, family = "binomial")

explain_titanic_glm <- explain(model_titanic_glm,
                              data = titanic_small[,-8],
                              y = titanic_small[,8])

cp_rf <- ceteris_paribus(explain_titanic_glm, titanic_small[1,])

calculate_oscillations(cp_rf)

library("randomForest")

apartments_rf_model <- randomForest(m2.price ~ construction.year + surface + floor +
                                   no.rooms + district, data = apartments)

explainer_rf <- explain(apartments_rf_model,
                       data = apartments_test[,-1],
                       y = apartments_test$m2.price)

apartment <- apartments_test[1,]

cp_rf <- ceteris_paribus(explainer_rf, apartment)

calculate_oscillations(cp_rf)
```

calculate_variable_profile

Internal Function for Individual Variable Profiles

Description

This function calculates individual variable profiles (ceteris paribus profiles), i.e. series of predictions from a model calculated for observations with altered single coordinate.

Usage

```
calculate_variable_profile(  
  data,  
  variable_splits,  
  model,  
  predict_function = predict,  
  ...  
)  
  
## Default S3 method:  
calculate_variable_profile(  
  data,  
  variable_splits,  
  model,  
  predict_function = predict,  
  ...  
)
```

Arguments

<code>data</code>	set of observations. Profile will be calculated for every observation (every row)
<code>variable_splits</code>	named list of vectors. Elements of the list are vectors with points in which profiles should be calculated. See an example for more details.
<code>model</code>	a model that will be passed to the <code>predict_function</code>
<code>predict_function</code>	function that takes data and model and returns numeric predictions. Note that the ... arguments will be passed to this function.
<code>...</code>	other parameters that will be passed to the <code>predict_function</code>

Details

Note that `calculate_variable_profile` function is S3 generic. If you want to work on non standard data sources (like H2O ddf, external databases) you should overload it.

Value

a data frame with profiles for selected variables and selected observations

References

Explanatory Model Analysis. Explore, Explain and Examine Predictive Models. <https://pbiecek.github.io/ema>

 calculate_variable_split

Internal Function for Split Points for Selected Variables

Description

This function calculate candidate splits for each selected variable. For numerical variables splits are calculated as percentiles (in general uniform quantiles of the length grid_points). For all other variables splits are calculated as unique values.

Usage

```
calculate_variable_split(
  data,
  variables = colnames(data),
  grid_points = 101,
  variable_splits_type = "quantiles",
  new_observation = NA
)
```

```
## Default S3 method:
calculate_variable_split(
  data,
  variables = colnames(data),
  grid_points = 101,
  variable_splits_type = "quantiles",
  new_observation = NA
)
```

Arguments

data	validation dataset. Is used to determine distribution of observations.
variables	names of variables for which splits shall be calculated
grid_points	number of points used for response path
variable_splits_type	how variable grids shall be calculated? Use "quantiles" (default) for percentiles or "uniform" to get uniform grid of points
new_observation	if specified (not NA) then all values in new_observation will be included in variable_splits

Details

Note that `calculate_variable_split` function is S3 generic. If you want to work on non standard data sources (like H2O ddf, external databases) you should overload it.

Value

A named list with splits for selected variables

ceteris_paribus

Ceteris Paribus Profiles aka Individual Variable Profiles

Description

This explainer works for individual observations. For each observation it calculates Ceteris Paribus Profiles for selected variables. Such profiles can be used to hypothesize about model results if selected variable is changed. For this reason it is also called 'What-If Profiles'.

Usage

```
ceteris_paribus(x, ...)

## S3 method for class 'explainer'
ceteris_paribus(
  x,
  new_observation,
  y = NULL,
  variables = NULL,
  variable_splits = NULL,
  grid_points = 101,
  variable_splits_type = "quantiles",
  ...
)

## Default S3 method:
ceteris_paribus(
  x,
  data,
  predict_function = predict,
  new_observation,
  y = NULL,
  variables = NULL,
  variable_splits = NULL,
  grid_points = 101,
  variable_splits_type = "quantiles",
  variable_splits_with_obs = FALSE,
  label = class(x)[1],
  ...
)
```

Arguments

x	an explainer created with the DALEX::explain() function, or a model to be explained.
...	other parameters
new_observation	a new observation with columns that corresponds to variables used in the model
y	true labels for new_observation. If specified then will be added to ceteris paribus plots. NOTE: It is best when target variable is not present in the new_observation
variables	names of variables for which profiles shall be calculated. Will be passed to calculate_variable_split . If NULL then all variables from the validation data will be used.
variable_splits	named list of splits for variables, in most cases created with calculate_variable_split . If NULL then it will be calculated based on validation data available in the explainer.
grid_points	maximum number of points for profile calculations. Note that the final number of points may be lower than grid_points, eg. if there is not enough unique values for a given variable. Will be passed to calculate_variable_split .
variable_splits_type	how variable grids shall be calculated? Use "quantiles" (default) for percentiles or "uniform" to get uniform grid of points
data	validation dataset. It will be extracted from x if it's an explainer NOTE: It is best when target variable is not present in the data
predict_function	predict function. It will be extracted from x if it's an explainer
variable_splits_with_obs	if TRUE then all values in new_observation will be included in variable_splits
label	name of the model. By default it's extracted from the class attribute of the model

Details

Find more details in [Ceteris Paribus Chapter](#).

Value

an object of the class ceteris_paribus_explainer.

```

ceteris_paribus_2d *Ceteris Paribus 2D Plot*

Description

This function calculates ceteris paribus profiles for grid of values spanned by two variables. It may be useful to identify or present interactions between two variables.

Usage

```
ceteris_paribus_2d(explainer, observation, grid_points = 101, variables = NULL)
```

Arguments

explainer	a model to be explained, preprocessed by the DALEX::explain() function
observation	a new observation for which predictions need to be explained
grid_points	number of points used for response path. Will be used for both variables
variables	if specified, then only these variables will be explained

Value

an object of the class `ceteris_paribus_2d_explainer`.

Examples

```
library("DALEX")

model_titanic_glm <- glm(survived ~ age + fare,
                        data = titanic_imputed, family = "binomial")

explain_titanic_glm <- explain(model_titanic_glm,
                              data = titanic_imputed[,-8],
                              y = titanic_imputed[,8])

cp_rf <- ceteris_paribus_2d(explain_titanic_glm, titanic_imputed[1,],
                          variables = c("age", "fare", "sibsp"))
head(cp_rf)

plot(cp_rf)

library("randomForest")
set.seed(59)

apartments_rf_model <- randomForest(m2.price ~., data = apartments)

explainer_rf <- explain(apartments_rf_model,
                      data = apartments_test[,-1],
                      y = apartments_test[,1])

new_apartment <- apartments_test[1,]
new_apartment

wi_rf_2d <- ceteris_paribus_2d(explainer_rf, observation = new_apartment,
                              variables = c("surface", "floor", "no.rooms"))
head(wi_rf_2d)
plot(wi_rf_2d)
```

cluster_profiles *Cluster Ceteris Paribus Profiles*

Description

This function calculates aggregates of ceteris paribus profiles based on hierarchical clustering.

Usage

```
cluster_profiles(  
  x,  
  ...,  
  aggregate_function = mean,  
  variable_type = "numerical",  
  center = FALSE,  
  k = 3,  
  variables = NULL  
)
```

Arguments

x	a ceteris paribus explainer produced with function <code>ceteris_paribus()</code>
...	other explainers that shall be plotted together
aggregate_function	a function for profile aggregation. By default it's mean
variable_type	a character. If numerical then only numerical variables will be computed. If categorical then only categorical variables will be computed.
center	shall profiles be centered before clustering
k	number of clusters for the <code>hclust</code> function
variables	if not NULL then only variables will be presented

Details

Find more details in the [Clustering Profiles Chapter](#).

Value

an object of the class `aggregated_profiles_explainer`

plot(cp_rf, color = "grey", variables = "age") +
  show_aggregated_profiles(clust_rf, color = "_label_", size = 2)

clust_rf <- cluster_profiles(cp_rf, k = 3, center = TRUE, variables = "age")
head(clust_rf)

```

conditional_dependence

Conditional Dependence Profiles

Description

Conditional Dependence Profiles (aka Local Profiles) average locally Ceteris Paribus Profiles. Function 'conditional_dependence' calls 'ceteris_paribus' and then 'aggregate_profiles'.

Usage

```
conditional_dependence(x, ...)

## S3 method for class 'explainer'
conditional_dependence(
  x,
  variables = NULL,
  N = 500,
  variable_splits = NULL,
  grid_points = 101,
  ...,
  variable_type = "numerical"
)

## Default S3 method:
conditional_dependence(
  x,
  data,
  predict_function = predict,
  label = class(x)[1],
  variables = NULL,
  N = 500,
  variable_splits = NULL,
  grid_points = 101,
  ...,
  variable_type = "numerical"
)

## S3 method for class 'ceteris_paribus_explainer'
conditional_dependence(x, ..., variables = NULL)

local_dependency(x, ...)

conditional_dependency(x, ...)
```

Arguments

x	an explainer created with function <code>DALEX::explain()</code> , an object of the class <code>ceteris_paribus_explainer</code> or a model to be explained.
...	other parameters
variables	names of variables for which profiles shall be calculated. Will be passed to calculate_variable_split . If <code>NULL</code> then all variables from the validation data will be used.
N	number of observations used for calculation of partial dependence profiles. By default 500.
variable_splits	named list of splits for variables, in most cases created with calculate_variable_split . If <code>NULL</code> then it will be calculated based on validation data available in the explainer.

grid_points	number of points for profile. Will be passed to <code>calculate_variable_split</code> .
variable_type	a character. If numerical then only numerical variables will be calculated. If categorical then only categorical variables will be calculated.
data	validation dataset, will be extracted from x if it's an explainer NOTE: It is best when target variable is not present in the data
predict_function	predict function, will be extracted from x if it's an explainer
label	name of the model. By default it's extracted from the class attribute of the model

Details

Find more details in the [Accumulated Local Dependence Chapter](#).

Value

an object of the class `aggregated_profile_explainer`

```
describe.partial_dependence_explainer
```

Natural language description of feature importance explainer

Description

Generic function `describe` generates a natural language description of `ceteris_paribus()`, `aggregated_profiles()` and `feature_importance()` explanations what enhances their interpretability.

Usage

```

## S3 method for class 'partial_dependence_explainer'
describe(
  x,
  nonsignificance_treshold = 0.15,
  ...,
  display_values = FALSE,
  display_numbers = FALSE,
  variables = NULL,
  label = "prediction"
)

describe(x, ...)

## S3 method for class 'ceteris_paribus_explainer'
describe(
  x,
  nonsignificance_treshold = 0.15,
  ...,
  display_values = FALSE,
  display_numbers = FALSE,
  variables = NULL,
  label = "prediction"
)

## S3 method for class 'feature_importance_explainer'
describe(x, nonsignificance_treshold = 0.15, ...)

```

Arguments

x	a ceteris paribus explanation produced with function <code>ceteris_paribus()</code>
nonsignificance_treshold	a parameter specifying a treshold for variable importance
...	other arguments
display_values	allows for displaying variable values
display_numbers	allows for displaying numerical values
variables	a character of a single variable name to be described
label	label for model's prediction

Details

Function `describe.ceteris_paribus()` generates a natural language description of ceteris paribus profile. The description summarizes variable values, that would change model's prediction at most. If a ceteris paribus profile for multiple variables is passed, `variables` must specify a single variable to be described. Works only for a ceteris paribus profile for one observation. In current version only categorical values are discribed. For `display_numbers = TRUE` three most important variable values are displayed, while `display_numbers = FALSE` displays all the important variables, however without further details.

Function `describe.ceteris_paribus()` generates a natural language description of ceteris paribus profile. The description summarizes variable values, that would change model's prediction at most. If a ceteris paribus profile for multiple variables is passed, `variables` must specify a single variable to be described. Works only for a ceteris paribus profile for one observation. For `display_numbers = TRUE` three most important variable values are displayed, while `display_numbers = FALSE` displays all the important variables, however without further details.

Function `describe.feature_importance_explainer()` generates a natural language description of feature importance explanation. It prints the number of important variables, that have significant dropout difference from the full model, depending on `nonsignificance_treshold`. The description prints the three most important variables for the model's prediction. The current design of DALEX explainer does not allow for displaying variables values.

Examples

```
library("DALEX")
library("randomForest")

model_titanic_rf <- randomForest(survived ~., data = titanic_imputed)

explain_titanic_rf <- explain(model_titanic_rf,
                             data = titanic_imputed[,-8],
                             y = titanic_imputed[,8],
                             label = "rf")

selected_passangers <- select_sample(titanic_imputed, n = 10)
cp_rf <- ceteris_paribus(explain_titanic_rf, selected_passangers)
```

```

pdp <- aggregate_profiles(cp_rf, type = "partial", variable_type = "categorical")
describe(pdp, variables = "gender")

library("DALEX")
library("randomForest")

model_titanic_rf <- randomForest(survived ~., data = titanic_imputed)

explain_titanic_rf <- explain(model_titanic_rf,
                             data = titanic_imputed[,-8],
                             y = titanic_imputed[,8],
                             label = "rf")

selected_passanger <- select_sample(titanic_imputed, n = 1, seed = 123)
cp_rf <- ceteris_paribus(explain_titanic_rf, selected_passanger)

plot(cp_rf, variable_type = "categorical")
describe(cp_rf, variables = "class", label = "the predicted probability")

library("DALEX")

lm_model <- lm(m2.price~., data = apartments)
explainer_lm <- explain(lm_model, data = apartments[,-1], y = apartments[,1])

fi_lm <- feature_importance(explainer_lm, loss_function = DALEX::loss_root_mean_square)

plot(fi_lm)
describe(fi_lm)

```

feature_importance *Feature Importance*

Description

This function calculates permutation based feature importance. For this reason it is also called the Variable Dropout Plot.

Usage

```

feature_importance(x, ...)

## S3 method for class 'explainer'
feature_importance(
  x,
  loss_function = DALEX::loss_root_mean_square,
  ...,

```

```

    type = c("raw", "ratio", "difference"),
    n_sample = NULL,
    B = 10,
    variables = NULL,
    variable_groups = NULL,
    N = n_sample,
    label = NULL
)

## Default S3 method:
feature_importance(
  x,
  data,
  y,
  predict_function = predict,
  loss_function = DALEX::loss_root_mean_square,
  ...,
  label = class(x)[1],
  type = c("raw", "ratio", "difference"),
  n_sample = NULL,
  B = 10,
  variables = NULL,
  N = n_sample,
  variable_groups = NULL
)

```

Arguments

x	an explainer created with function <code>DALEX::explain()</code> , or a model to be explained.
...	other parameters
loss_function	a function that will be used to assess variable importance
type	character, type of transformation that should be applied for dropout loss. "raw" results raw drop lossess, "ratio" returns <code>drop_loss/drop_loss_full_model</code> while "difference" returns <code>drop_loss - drop_loss_full_model</code>
n_sample	alias for N held for backwards compatibility. number of observations that should be sampled for calculation of variable importance.
B	integer, number of permutation rounds to perform on each variable. By default it's 10.
variables	vector of variables. If NULL then variable importance will be tested for each variable from the data separately. By default NULL
variable_groups	list of variables names vectors. This is for testing joint variable importance. If NULL then variable importance will be tested separately for variables. By default NULL. If specified then it will override variables

```

                                "family" = c("sibsp", "parch"),
                                "embarked" = "embarked"),
    label = "lm 5 groups")

plot(fi_glm_joint2, fi_glm_joint1)

library("randomForest")
model_titanic_rf <- randomForest(survived ~., data = titanic_imputed)

explain_titanic_rf <- explain(model_titanic_rf,
                              data = titanic_imputed[,-8],
                              y = titanic_imputed[,8])

                                  variable_groups = list("demographics" = c("gender", "age"),
                                                         "wealth" = c("fare", "class"),
                                                         "family" = c("sibsp", "parch"),
                                                         "embarked" = "embarked"),
                                  label = "rf 4 groups")

plot(fi_rf_group, fi_rf)

HR_rf_model <- randomForest(status ~., data = HR, ntree = 100)

explainer_rf <- explain(HR_rf_model, data = HR, y = HR$status,
                       verbose = FALSE, precalculate = FALSE)

fi_rf <- feature_importance(explainer_rf, type = "raw",
                           loss_function = loss_cross_entropy)

head(fi_rf)
plot(fi_rf)

HR_glm_model <- glm(status == "fired"~., data = HR, family = "binomial")
explainer_glm <- explain(HR_glm_model, data = HR, y = HR$status == "fired")
fi_glm <- feature_importance(explainer_glm, type = "raw",
                            loss_function = DALEX::loss_root_mean_square)

head(fi_glm)
plot(fi_glm)

```

Description

Partial Dependence Profiles are averages from Ceteris Paribus Profiles. Function `partial_dependence` calls `ceteris_paribus` and then `aggregate_profiles`.

Usage

```
partial_dependence(x, ...)

## S3 method for class 'explainer'
partial_dependence(
  x,
  variables = NULL,
  N = 500,
  variable_splits = NULL,
  grid_points = 101,
  ...,
  variable_type = "numerical"
)

## Default S3 method:
partial_dependence(
  x,
  data,
  predict_function = predict,
  label = class(x)[1],
  variables = NULL,
  grid_points = 101,
  variable_splits = NULL,
  N = 500,
  ...,
  variable_type = "numerical"
)

## S3 method for class 'ceteris_paribus_explainer'
partial_dependence(x, ..., variables = NULL)

partial_dependency(x, ...)
```

Arguments

<code>x</code>	an explainer created with function <code>DALEX::explain()</code> , an object of the class <code>ceteris_paribus_explainer</code> or a model to be explained.
<code>...</code>	other parameters
<code>variables</code>	names of variables for which profiles shall be calculated. Will be passed to calculate_variable_split . If <code>NULL</code> then all variables from the validation data will be used.
<code>N</code>	number of observations used for calculation of partial dependence profiles. By default 500.

```

y = titanic_imputed[,8],
verbose = FALSE)

pdp_rf <- partial_dependence(explain_titanic_rf, variable_type = "numerical")
plot(pdp_rf)

pdp_rf <- partial_dependence(explain_titanic_rf, variable_type = "categorical")
plotD3(pdp_rf, label_margin = 80, scale_plot = TRUE)

```

plot.agggregated_profiles_explainer
Plots Aggregated Profiles

Description

Function `plot.agggregated_profiles_explainer` plots partial dependence plot or accumulated effect plot. It works in a similar way to `plot.ceteris_paribus`, but instead of individual profiles show average profiles for each variable listed in the `variables` vector.

Usage

```

## S3 method for class 'agggregated_profiles_explainer'
plot(
  x,
  ...,
  size = 1,
  alpha = 1,
  color = "_label_",
  facet_ncol = NULL,
  variables = NULL,
  title = NULL,
  subtitle = NULL
)

```

Arguments

<code>x</code>	a <i>ceteris paribus</i> explainer produced with function <code>aggregate_profiles()</code>
<code>...</code>	other explainers that shall be plotted together
<code>size</code>	a numeric. Size of lines to be plotted
<code>alpha</code>	a numeric between 0 and 1. Opacity of lines
<code>color</code>	a character. Either name of a color, or hex code for a color, or <code>_label_</code> if models shall be colored, or <code>_ids_</code> if instances shall be colored
<code>facet_ncol</code>	number of columns for the facet_wrap
<code>variables</code>	if not NULL then only <code>variables</code> will be presented
<code>title</code>	a character. Partial and accumulated dependence explainers have default value.
<code>subtitle</code>	a character. If NULL value will be dependent on model usage.

Value

a ggplot2 object

`plot.ceteris_paribus_2d_explainer`

Plot Ceteris Paribus 2D Explanations

Description

This function plots What-If Plots for a single prediction / observation.

Usage

```

## S3 method for class 'ceteris_paribus_2d_explainer'
plot(
  x,
  ...,
  facet_ncol = NULL,
  add_raster = TRUE,
  add_contour = TRUE,
  bins = 3,
  add_observation = TRUE,
  pch = "+",
  size = 6
)

```

Arguments

<code>x</code>	a ceteris paribus explainer produced with the <code>ceteris_paribus_2d()</code> function
<code>...</code>	currently will be ignored
<code>facet_ncol</code>	number of columns for the facet_wrap
<code>add_raster</code>	if TRUE then <code>geom_raster</code> will be added to present levels with diverging colors
<code>add_contour</code>	if TRUE then <code>geom_contour</code> will be added to present contours
<code>bins</code>	number of contours to be added
<code>add_observation</code>	if TRUE then <code>geom_point</code> will be added to present observation that is explained
<code>pch</code>	character, symbol used to plot observations
<code>size</code>	numeric, size of individual datapoints

plot.ceteris_paribus_explainer
```

Plots Ceteris Paribus Profiles

Description

Function `plot.ceteris_paribus_explainer` plots Individual Variable Profiles for selected observations. Various parameters help to decide what should be plotted, profiles, aggregated profiles, points or rugs.

Find more details in [Ceteris Paribus Chapter](#).

Usage

```
## S3 method for class 'ceteris_paribus_explainer'
plot(
  x,
  ...,
  size = 1,
  alpha = 1,
  color = "#46bac2",
  variable_type = "numerical",
  facet_ncol = NULL,
  variables = NULL,
  title = "Ceteris Paribus profile",
  subtitle = NULL,
  categorical_type = "lines"
)
```

Arguments

<code>x</code>	a ceteris paribus explainer produced with function <code>ceteris_paribus()</code>
<code>...</code>	other explainers that shall be plotted together
<code>size</code>	a numeric. Size of lines to be plotted
<code>alpha</code>	a numeric between 0 and 1. Opacity of lines
<code>color</code>	a character. Either name of a color or name of a variable that should be used for coloring
<code>variable_type</code>	a character. If <code>numerical</code> then only numerical variables will be plotted. If <code>categorical</code> then only categorical variables will be plotted.
<code>facet_ncol</code>	number of columns for the facet_wrap
<code>variables</code>	if not <code>NULL</code> then only variables will be presented
<code>title</code>	a character. Plot title. By default "Ceteris Paribus profile".
<code>subtitle</code>	a character. Plot subtitle. By default <code>NULL</code> - then subtitle is set to "created for the XXX, YYY model", where XXX, YYY are labels of given explainers.
<code>categorical_type</code>	a character. How categorical variables shall be plotted? Either "lines" (default) or "bars".

Value

a ggplot2 object

vips

plot(vips)
```

```
plot.feature_importance_explainer
Plots Feature Importance
```

Description

This function plots variable importance calculated as changes in the loss function after variable drops. It uses output from `feature_importance` function that corresponds to permutation based measure of variable importance. Variables are sorted in the same order in all panels. The order depends on the average drop out loss. In different panels variable contributions may not look like sorted if variable importance is different in different in different models.

Usage

```
## S3 method for class 'feature_importance_explainer'
plot(
  x,
  ...,
  max_vars = NULL,
  show_boxplots = TRUE,
  bar_width = 10,
  desc_sorting = TRUE,
  title = "Feature Importance",
  subtitle = NULL
)
```

Arguments

x	a feature importance explainer produced with the <code>feature_importance()</code> function
...	other explainers that shall be plotted together

<code>max_vars</code>	maximum number of variables that shall be presented for for each model. By default NULL what means all variables
<code>show_boxplots</code>	logical if TRUE (default) boxplot will be plotted to show permutation data.
<code>bar_width</code>	width of bars. By default 10
<code>desc_sorting</code>	logical. Should the bars be sorted descending? By default TRUE
<code>title</code>	the plot's title, by default 'Feature Importance'
<code>subtitle</code>	the plot's subtitle. By default - NULL, which means the subtitle will be 'created for the XXX model', where XXX is the label of explainer(s)

Details

Find more details in the [Feature Importance Chapter](#).

Value

a ggplot2 object

fi_glm <- feature_importance(explainer_glm, type = "raw",
                             loss_function = loss_root_mean_square)
head(fi_glm)
plot(fi_glm)

```

plotD3

Plots Ceteris Paribus Profiles in D3 with r2d3 Package.

Description

Function `plotD3.ceteris_paribus_explainer` plots Individual Variable Profiles for selected observations. It uses output from `ceteris_paribus` function. Various parameters help to decide what should be plotted, profiles, aggregated profiles, points or rugs.

Find more details in [Ceteris Paribus Chapter](#).

Usage

```

plotD3(x, ...)

## S3 method for class 'ceteris_paribus_explainer'
plotD3(
  x,
  ...,
  size = 2,
  alpha = 1,
  color = "#46bac2",
  variable_type = "numerical",
  facet_ncol = 2,
  scale_plot = FALSE,
  variables = NULL,
  chart_title = "Ceteris Paribus Profiles",
  label_margin = 60,
  show_observations = TRUE,
  show_rugs = TRUE
)

```

Arguments

x	a ceteris paribus explainer produced with function <code>ceteris_paribus()</code>
...	other explainers that shall be plotted together
size	a numeric. Set width of lines
alpha	a numeric between 0 and 1. Opacity of lines
color	a character. Set line color
variable_type	a character. If "numerical" then only numerical variables will be plotted. If "categorical" then only categorical variables will be plotted.
facet_ncol	number of columns for the <code>facet_wrap</code>
scale_plot	a logical. If TRUE, the height of plot scales with window size. By default it's FALSE
variables	if not NULL then only variables will be presented
chart_title	a character. Set custom title
label_margin	a numeric. Set width of label margins in categorical type
show_observations	a logical. Adds observations layer to a plot. By default it's TRUE
show_rugs	a logical. Adds rugs layer to a plot. By default it's TRUE

Value

a r2d3 object.

Examples

```
library("DALEX")
library("randomForest")

model_titanic_rf <- randomForest(survived ~., data = titanic_imputed)

explain_titanic_rf <- explain(model_titanic_rf,
                             data = titanic_imputed[,-8],
                             y = titanic_imputed[,8],
                             label = "rf")

selected_passangers <- select_sample(titanic_imputed, n = 10)
cp_rf <- ceteris_paribus(explain_titanic_rf, selected_passangers)

plotD3(cp_rf, variables = c("age", "parch", "fare", "sibsp"),
        facet_ncol = 2, scale_plot = TRUE)

selected_passanger <- select_sample(titanic_imputed, n = 1)
cp_rf <- ceteris_paribus(explain_titanic_rf, selected_passanger)

plotD3(cp_rf, variables = c("class", "embarked", "gender", "sibsp"),
        facet_ncol = 2, variable_type = "categorical", label_margin = 100, scale_plot = TRUE)
```

 plotD3.agggregated_profiles_explainer

Plots Aggregated Ceteris Paribus Profiles in D3 with r2d3 Package.

Description

Function `plotD3.agggregated_profiles_explainer` plots an aggregate of ceteris paribus profiles. It works in a similar way to `plotD3.ceteris_paribus_explainer` but, instead of individual profiles, show average profiles for each variable listed in the `variables` vector.

Find more details in [Ceteris Paribus Chapter](#).

Usage

```
## S3 method for class 'agggregated_profiles_explainer'
plotD3(
  x,
  ...,
  size = 2,
  alpha = 1,
  color = "#46bac2",
  facet_ncol = 2,
  scale_plot = FALSE,
  variables = NULL,
  chart_title = "Aggregated Profiles",
  label_margin = 60
)
```

Arguments

<code>x</code>	a aggregated profiles explainer produced with function <code>aggregate_profiles()</code>
<code>...</code>	other explainers that shall be plotted together
<code>size</code>	a numeric. Set width of lines
<code>alpha</code>	a numeric between 0 and 1. Opacity of lines
<code>color</code>	a character. Set line/bar color
<code>facet_ncol</code>	number of columns for the facet_wrap
<code>scale_plot</code>	a logical. If TRUE, the height of plot scales with window size. By default it's FALSE
<code>variables</code>	if not NULL then only variables will be presented
<code>chart_title</code>	a character. Set custom title
<code>label_margin</code>	a numeric. Set width of label margins in categorical type

Value

a `r2d3` object.

Examples

```
library("DALEX")
library("randomForest")

# smaller data, quicker example
titanic_small <- select_sample(titanic_imputed, n = 500, seed = 1313)

# build a model
model_titanic_rf <- randomForest(survived ~., data = titanic_small)

explain_titanic_rf <- explain(model_titanic_rf,
                             data = titanic_small[,-8],
                             y = titanic_small[,8],
                             label = "Random Forest v7")

selected_passangers <- select_sample(titanic_small, n = 100)
cp_rf <- ceteris_paribus(explain_titanic_rf, selected_passangers)

pdp_rf_p <- aggregate_profiles(cp_rf, type = "partial", variable_type = "numerical")
pdp_rf_p$`_label_` <- "RF_partial"
pdp_rf_c <- aggregate_profiles(cp_rf, type = "conditional", variable_type = "numerical")
pdp_rf_c$`_label_` <- "RF_conditional"
pdp_rf_a <- aggregate_profiles(cp_rf, type = "accumulated", variable_type = "numerical")
pdp_rf_a$`_label_` <- "RF_accumulated"

plotD3(pdp_rf_p, pdp_rf_c, pdp_rf_a, scale_plot = TRUE)

pdp <- aggregate_profiles(cp_rf, type = "partial", variable_type = "categorical")
pdp$`_label_` <- "RF_partial"

plotD3(pdp, variables = c("gender", "class"), label_margin = 70)
```

plotD3.feature_importance_explainer

Plot Feature Importance Objects in D3 with r2d3 Package.

Description

Function `plotD3.feature_importance_explainer` plots dropouts for variables used in the model. It uses output from `feature_importance` function that corresponds to permutation based measure of feature importance. Variables are sorted in the same order in all panels. The order depends on the average drop out loss. In different panels variable contributions may not look like sorted if variable importance is different in different models.

Usage

```
## S3 method for class 'feature_importance_explainer'
plotD3(
  x,
  ...,
  max_vars = NULL,
  show_boxplots = TRUE,
  bar_width = 12,
  split = "model",
  scale_height = FALSE,
  margin = 0.15,
  chart_title = "Feature importance"
)
```

Arguments

x	a feature importance explainer produced with the feature_importance() function
...	other explainers that shall be plotted together
max_vars	maximum number of variables that shall be presented for for each model. By default NULL which means all variables
show_boxplots	logical if TRUE (default) boxplot will be plotted to show permutation data.
bar_width	width of bars in px. By default 12px
split	either "model" or "feature" determines the plot layout
scale_height	a logical. If TRUE, the height of plot scales with window size. By default it's FALSE
margin	extend x axis domain range to adjust the plot. Usually value between 0.1 and 0.3, by default it's 0.15
chart_title	a character. Set custom title

Value

a r2d3 object.

Examples

```
library("DALEX")

lm_model <- lm(m2.price ~., data = apartments)
explainer_lm <- explain(lm_model,
  data = apartments[,-1],
  y = apartments[,1],
  verbose = FALSE)

fi_lm <- feature_importance(explainer_lm,
  loss_function = DALEX::loss_root_mean_square, B = 1)
```

```
head(fi_lm)
plotD3(fi_lm)

library("randomForest")

rf_model <- randomForest(m2.price~., data = apartments)

explainer_rf <- explain(rf_model,
                        data = apartments[,-1],
                        y = apartments[,1],
                        label = "rf", verbose = FALSE)

fi_rf <- feature_importance(explainer_rf, loss_function = DALEX::loss_root_mean_square)

head(fi_rf)
plotD3(fi_lm, fi_rf)

plotD3(fi_lm, fi_rf, split = "feature")

plotD3(fi_lm, fi_rf, max_vars = 3, bar_width = 16, scale_height = TRUE)
plotD3(fi_lm, fi_rf, max_vars = 3, bar_width = 16, split = "feature", scale_height = TRUE)
plotD3(fi_lm, margin = 0.2)
```

```
print.agggregated_profiles_explainer
      Prints Aggregated Profiles
```

Description

Prints Aggregated Profiles

Usage

```
## S3 method for class 'agggregated_profiles_explainer'
print(x, ...)
```

Arguments

x	an individual variable profile explainer produced with the <code>aggregate_profiles()</code> function
...	other arguments that will be passed to <code>head()</code>

Examples

```
library("DALEX")

model_titanic_glm <- glm(survived ~ gender + age + fare,
                        data = titanic_imputed, family = "binomial")

explain_titanic_glm <- explain(model_titanic_glm,
                              data = titanic_imputed[,-8],
                              y = titanic_imputed[,8])

selected_passangers <- select_sample(titanic_imputed, n = 100)
cp_rf <- ceteris_paribus(explain_titanic_glm, selected_passangers)

head(cp_rf)

pdp_rf <- aggregate_profiles(cp_rf, variables = "age")
head(pdp_rf)

library("randomForest")

model_titanic_rf <- randomForest(survived ~., data = titanic_imputed)

explain_titanic_rf <- explain(model_titanic_rf,
                              data = titanic_imputed[,-8],
                              y = titanic_imputed[,8],
                              verbose = FALSE, precalculate = FALSE)

cp_rf <- ceteris_paribus(explain_titanic_rf, selected_passangers)
cp_rf

pdp_rf <- aggregate_profiles(cp_rf, variables = "age")
head(pdp_rf)
```

```
print.ceteris_paribus_explainer
```

Prints Individual Variable Explainer Summary

Description

Prints Individual Variable Explainer Summary

Usage

```
## S3 method for class 'ceteris_paribus_explainer'
print(x, ...)
```

Arguments

x an individual variable profile explainer produced with the `ceteris_paribus()` function

... other arguments that will be passed to `head()`

Examples

```
library("DALEX")
library("randomForest")

apartments_rf_model <- randomForest(m2.price ~., data = apartments)

explainer_rf <- explain(apartments_rf_model,
  data = apartments_test[,-1],
  y = apartments_test[,1])

apartments_small <- select_sample(apartments_test, 10)

cp_rf <- ceteris_paribus(explainer_rf, apartments_small)
cp_rf
```

```
print.feature_importance_explainer
```

Print Generic for Feature Importance Object

Description

Print Generic for Feature Importance Object

Usage

```
## S3 method for class 'feature_importance_explainer'
print(x, ...)
```

Arguments

x an explanation created with `feature_importance`

... other parameters.

Value

a data frame.

References

Explanatory Model Analysis. Explore, Explain and Examine Predictive Models. <https://pbiecek.github.io/ema>

Examples

```

library("DALEX")

model_titanic_glm <- glm(survived ~ gender + age + fare,
                        data = titanic_imputed, family = "binomial")

explain_titanic_glm <- explain(model_titanic_glm,
                              data = titanic_imputed[, -8],
                              y = titanic_imputed[, 8])

fi_glm <- feature_importance(explain_titanic_glm)

fi_glm

```

select_neighbours	<i>Select Subset of Rows Closest to a Specified Observation</i>
-------------------	---

Description

Function `select_neighbours` selects subset of rows from data set. This is useful if data is large and we need just a sample to calculate profiles.

Usage

```

select_neighbours(
  observation,
  data,
  variables = NULL,
  distance = gower::gower_dist,
  n = 20,
  frac = NULL
)

```

Arguments

observation	single observation
data	set of observations
variables	names of variables that shall be used for calculation of distance. By default these are all variables present in data and observation
distance	the distance function, by default the <code>gower_dist()</code> function.
n	number of neighbours to select
frac	if n is not specified (NULL), then will be calculated as <code>frac * number of rows in data</code> . Either n or frac need to be specified.

Details

Note that `select_neighbours()` function is S3 generic. If you want to work on non standard data sources (like H2O ddf, external databases) you should overload it.

Value

a data frame with selected rows

Examples

```
library("DALEX")

new_apartment <- apartments[1,]
small_apartments <- select_neighbours(new_apartment, apartments_test, n = 10)

new_apartment
small_apartments
```

select_sample	<i>Select Subset of Rows</i>
---------------	------------------------------

Description

Function `select_sample` selects subset of rows from data set. This is useful if data is large and we need just a sample to calculate profiles.

Usage

```
select_sample(data, n = 100, seed = 1313)
```

Arguments

data	set of observations. Profile will be calculated for every observation (every row)
n	number of observations to select.
seed	seed for random number generator.

Details

Note that `select_subsample()` function is S3 generic. If you want to work on non standard data sources (like H2O ddf, external databases) you should overload it.

Value

a data frame with selected rows

Examples

```
library("DALEX")

small_apartments <- select_sample(apartments_test)
head(small_apartments)
```

show_aggregated_profiles

Adds a Layer with Aggregated Profiles

Description

Function `show_aggregated_profiles` adds a layer to a plot created with `plot.ceteris_paribus_explainer`.

Usage

```
show_aggregated_profiles(
  x,
  ...,
  size = 0.5,
  alpha = 1,
  color = "#371ea3",
  variables = NULL
)
```

Arguments

<code>x</code>	a ceteris paribus explainer produced with function <code>ceteris_paribus()</code>
<code>...</code>	other explainers that shall be plotted together
<code>size</code>	a numeric. Size of lines to be plotted
<code>alpha</code>	a numeric between 0 and 1. Opacity of lines
<code>color</code>	a character. Either name of a color or name of a variable that should be used for coloring
<code>variables</code>	if not NULL then only variables will be presented

Value

a ggplot2 layer

Examples

```

library("DALEX")

selected_passangers <- select_sample(titanic_imputed, n = 100)

model_titanic_glm <- glm(survived ~ gender + age + fare,
                        data = titanic_imputed, family = "binomial")

explain_titanic_glm <- explain(model_titanic_glm,
                              data = titanic_imputed[,-8],
                              y = titanic_imputed[,8])

cp_rf <- ceteris_paribus(explain_titanic_glm, selected_passangers)

pdp_rf <- aggregate_profiles(cp_rf, type = "partial", variables = "age")

plot(cp_rf, variables = "age") +
  show_observations(cp_rf, variables = "age") +
  show_aggregated_profiles(pdp_rf, size = 3)

library("randomForest")

model_titanic_rf <- randomForest(survived ~., data = titanic_imputed)

explain_titanic_rf <- explain(model_titanic_rf,
                              data = titanic_imputed[,-8],
                              y = titanic_imputed[,8],
                              verbose = FALSE, precalculate = FALSE)

cp_rf <- ceteris_paribus(explain_titanic_rf, selected_passangers)
cp_rf

pdp_rf <- aggregate_profiles(cp_rf, type = "partial", variables = "age")
head(pdp_rf)

plot(cp_rf, variables = "age") +
  show_observations(cp_rf, variables = "age") +
  show_rugs(cp_rf, variables = "age", color = "red") +
  show_aggregated_profiles(pdp_rf, size = 3)

```

show_observations *Adds a Layer with Observations to a Profile Plot*

Description

Function `show_observations` adds a layer to a plot created with `plot.ceteris_paribus_explainer` for selected observations. Various parameters help to decide what should be plotted, profiles, aggregated profiles, points or rugs.

Usage

```
show_observations(
  x,
  ...,
  size = 2,
  alpha = 1,
  color = "#371ea3",
  variable_type = "numerical",
  variables = NULL
)
```

Arguments

x	a ceteris paribus explainer produced with function <code>ceteris_paribus()</code>
...	other explainers that shall be plotted together
size	a numeric. Size of lines to be plotted
alpha	a numeric between 0 and 1. Opacity of lines
color	a character. Either name of a color or name of a variable that should be used for coloring
variable_type	a character. If numerical then only numerical variables will be plotted. If categorical then only categorical variables will be plotted.
variables	if not NULL then only variables will be presented

Value

a ggplot2 layer

Examples

```
library("DALEX")
library("randomForest")

rf_model <- randomForest(survived ~.,
                        data = titanic_imputed)

explainer_rf <- explain(rf_model,
                      data = titanic_imputed[,-8],
                      y = titanic_imputed[,8],
                      label = "RF", verbose = FALSE)

selected_passangers <- select_sample(titanic_imputed, n = 100)
cp_rf <- ceteris_paribus(explainer_rf, selected_passangers)
cp_rf

plot(cp_rf, variables = "age", color = "grey") +
show_observations(cp_rf, variables = "age", color = "black") +
show_rugs(cp_rf, variables = "age", color = "red")
```

show_profiles	<i>Adds a Layer with Profiles</i>
---------------	-----------------------------------

Description

Function `show_profiles` adds a layer to a plot created with `plot.ceteris_paribus_explainer`.

Usage

```
show_profiles(  
  x,  
  ...,  
  size = 0.5,  
  alpha = 1,  
  color = "#371ea3",  
  variables = NULL  
)
```

Arguments

<code>x</code>	a ceteris paribus explainer produced with function <code>ceteris_paribus()</code>
<code>...</code>	other explainers that shall be plotted together
<code>size</code>	a numeric. Size of lines to be plotted
<code>alpha</code>	a numeric between 0 and 1. Opacity of lines
<code>color</code>	a character. Either name of a color or name of a variable that should be used for coloring
<code>variables</code>	if not NULL then only variables will be presented

Value

a ggplot2 layer

Examples

```
library("DALEX")  
  
selected_passangers <- select_sample(titanic_imputed, n = 100)  
selected_john <- titanic_imputed[1,]  
  
model_titanic_glm <- glm(survived ~ gender + age + fare,  
  data = titanic_imputed, family = "binomial")  
  
explain_titanic_glm <- explain(model_titanic_glm,  
  data = titanic_imputed[,-8],  
  y = titanic_imputed[,8],  
  label = "cool_model", verbose = FALSE)
```

```

cp_rf <- ceteris_paribus(explain_titanic_glm, selected_passangers)
cp_rf_john <- ceteris_paribus(explain_titanic_glm, selected_john)
plot(cp_rf, variables = "age") +
  show_profiles(cp_rf_john, variables = "age", size = 2)

library("randomForest")

model_titanic_rf <- randomForest(survived ~., data = titanic_imputed)

explain_titanic_rf <- explain(model_titanic_rf,
                             data = titanic_imputed[,-8],
                             y = titanic_imputed[,8],
                             verbose = FALSE, precalculate = FALSE)

cp_rf <- ceteris_paribus(explain_titanic_rf, selected_passangers)
cp_rf_john <- ceteris_paribus(explain_titanic_rf, selected_john)

cp_rf

pdp_rf <- aggregate_profiles(cp_rf, variables = "age")
head(pdp_rf)

plot(cp_rf, variables = "age") +
  show_observations(cp_rf, variables = "age") +
  show_rugs(cp_rf, variables = "age", color = "red") +
  show_profiles(cp_rf_john, variables = "age", color = "red", size = 2)

```

show_residuals

Adds a Layer with Residuals to a Profile Plot

Description

Function `show_residuals` adds a layer to a plot created with `plot.ceteris_paribus_explainer` for selected observations. Note that the `y` argument has to be specified in the `ceteris_paribus` function.

Usage

```

show_residuals(
  x,
  ...,
  size = 0.75,
  alpha = 1,
  color = c(`TRUE` = "#8bdcbe", `FALSE` = "#f05a71"),
  variables = NULL
)

```

Arguments

x	a ceteris paribus explainer produced with function <code>ceteris_paribus()</code> . Note that y parameter shall be supplied in this function.
...	other explainers that shall be plotted together
size	a numeric. Size of lines to be plotted
alpha	a numeric between 0 and 1. Opacity of lines
color	a character. Either name of a color or name of a variable that should be used for coloring
variables	if not NULL then only variables will be presented

Value

a ggplot2 layer

Examples

```
library("DALEX")
library("randomForest")

johnny_d <- data.frame(
  class = factor("1st", levels = c("1st", "2nd", "3rd", "deck crew", "engineering crew",
                                   "restaurant staff", "victualling crew")),
  gender = factor("male", levels = c("female", "male")),
  age = 8,
  sibsp = 0,
  parch = 0,
  fare = 72,
  embarked = factor("Southampton", levels = c("Belfast", "Cherbourg", "Queenstown", "Southampton"))
)

show_rugs

Adds a Layer with Rugs to a Profile Plot

Description

Function `show_rugs` adds a layer to a plot created with `plot.ceteris_paribus_explainer` for selected observations. Various parameters help to decide what should be plotted, profiles, aggregated profiles, points or rugs.

Usage

```

show_rugs(
  x,
  ...,
  size = 0.5,
  alpha = 1,
  color = "#371ea3",
  variable_type = "numerical",
  sides = "b",
  variables = NULL
)

```

Arguments

<code>x</code>	a ceteris paribus explainer produced with function <code>ceteris_paribus()</code>
<code>...</code>	other explainers that shall be plotted together
<code>size</code>	a numeric. Size of lines to be plotted
<code>alpha</code>	a numeric between 0 and 1. Opacity of lines
<code>color</code>	a character. Either name of a color or name of a variable that should be used for coloring
<code>variable_type</code>	a character. If <code>numerical</code> then only numerical variables will be plotted. If <code>categorical</code> then only categorical variables will be plotted.
<code>sides</code>	a string containing any of "trbl", for top, right, bottom, and left. Passed to <code>geom_rug</code> .
<code>variables</code>	if not <code>NULL</code> then only variables will be presented

Value

a ggplot2 layer

Examples

```
library("DALEX")
library("randomForest")

rf_model <- randomForest(survived ~., data = titanic_imputed)

explainer_rf <- explain(rf_model, data = titanic_imputed[,-8],
                       y = titanic_imputed[,8],
                       label = "RF", verbose = FALSE)

selected_passangers <- select_sample(titanic_imputed, n = 100)
cp_rf <- ceteris_paribus(explainer_rf, selected_passangers)
cp_rf

plot(cp_rf, variables = "age", color = "grey") +
  show_observations(cp_rf, variables = "age", color = "black") +
  show_rugs(cp_rf, variables = "age", color = "red")
```
