

# Package ‘intcure’

May 18, 2020

**Encoding** UTF-8

**Title** Mixture Cure Models with Random Effects

**Version** 2.1

**Description** Mixture cure models with random effects to survival data as described in Peng and Taylor (2011) <doi:10.1002/sim.4098>.

**Depends** survival, R (>= 3.5.0)

**Imports** mvtnorm, cubature

**License** GPL-3

**RoxygenNote** 7.1.0

**NeedsCompilation** no

**Author** Yingwei Peng [aut, cre]

**Maintainer** Yingwei Peng <yingwei.peng@queensu.ca>

**Repository** CRAN

**Date/Publication** 2020-05-18 15:10:11 UTC

intcure-package

*Random effects mixture cure models*

---

**Description**

Fit random effects mixture cure models

**Details**

This package fits a mixture cure model with random effects in both latency and incidence parts of the model. The random effects in the two parts can be correlated.

**Author(s)**

Yingwei Peng

**References**

Peng, Y. and Taylor, J. M. G. Mixture cure model with random effects for the analysis of a multi-centre tonsil cancer study. *Statistics in Medicine*, 30:211-223, 2011

---

basesurvfun

*Estimated baseline survival function*

---

**Description**

Estimate the baseline survival probabilities at specified time points

**Usage**

```
basesurvfun(time, intcureobj)
```

**Arguments**

`time` a vector of time points at which survival probabilities will be calculated.  
`intcureobj` an object from `intcure` function

**Details**

The estimated baseline survival function should be a continuous function and will be smooth if the `basedist = "exponential"` or `"Weibull"`

**Value**

a vector of the same length as `time` containing the survival probabilities at `time`

**Author(s)**

Yingwei Peng

**See Also**[intcure](#)**Examples**

```
data(bmtfit)
# Estimated baseline survival at 1 year
basesurvfun(1, bmtfit)
plot(function(x)basesurvfun(x, intcureobj = bmtfit), from = 0, to = 6, type = "l")
```

---

**bmt***Data from bone marrow transplant patients*

---

**Description**

This data set is used in the examples of this package.

**Usage**

```
data(bmt)
```

**Format**

A data.frame object with columns:

**time:** Disease Free Survival Time (Time To Relapse, Death Or End Of Study).

**cens:** Relapse Indicator with 1-Relapsed, 0-Disease Free.

**g:** Disease Group with 1-ALL, 2-AML Low Risk, 3-AML High Risk.

**FAB:** 1-FAB Grade 4 Or 5 and AML, 0-Otherwise.

**inst:** Hospital with 1-The Ohio State University, 2-Alferd , 3-St. Vincent, 4-Hahnemann.

**Source**

Klein, J. P. & Moeschberger, M. L. Survival Analysis, Techniques for Censored and Truncated Data  
Springer-Verlag, 2003

**Examples**

```
data(bmt)
```

---

**bmtfit**
*Model fit from a mixture cure model with random effects to bmt data*

---

**Description**

This is the result of the model fit intcure as shown below

**Usage**

```
data(bmtfit)
```

**Format**

A list of class intcure

**Examples**

```
# bmtfit = intcure(Surv(time, cens) ~ g + FAB + cluster(inst), ~ g + FAB,
# data = bmt, basedist = "weibull", sigma = c(-1, NA, NA),
# optimcfg = list(method = "BFGS", hessian = TRUE, maxit = 2000)).
data(bmtfit)
```

---

**coef.intcure**
*Retrieve coefficients from a fitted mixture cure model with random effects*

---

**Description**

It collects all the estimates from a fitted mixture cure model with random effects and forms a long vector.

**Usage**

```
## S3 method for class 'intcure'
coef(object, ...)
```

**Arguments**

```
object      an intcure object obtained from intcure
...         inherited but not used here
```

**Value**

a vector consists of bt, gm, basepara and sigma

**Author(s)**

Yingwei Peng

**See Also**[intcure](#)**Examples**

```
data(bmtfit)
coef(bmtfit)
```

---

`intcure`*Mixture cure models with random effects*

---

**Description**

Fit mixture cure models with random effects based on numerical integration.

**Usage**

```
intcure(
  formula = formula(data),
  cureform = NULL,
  data = sys.parent(),
  subset,
  na.action,
  bt = NULL,
  gm = NULL,
  basepara = NULL,
  sigma = c(0, 0, 0),
  optimcfg = list(ndeps = 0.001, maxit = 1000, reltol = 1e-05, method = "Nelder-Mead",
    hessian = FALSE),
  intcfg = list(eps = 1e-04, lower = c(-5, -5), upper = c(5, 5)),
  basedist = c("exponential", "weibull", "piecewise"),
  npiece = 3,
  piececut = NULL,
  piececuttype = c("quantile", "even"),
  model = FALSE,
  y = TRUE,
  x = FALSE,
  z = FALSE,
  funval = FALSE,
  debug = c("intcure", "integration", "optim")
)
```

**Arguments**

formula	a formula expression similar to the one used in <code>survreg</code> and <code>coxph</code> . The response is a survival object returned by the <code>Surv()</code> function. It is used to specify the time (and censoring variable) variable and covariates in the model for uncured patients. A covariate that defines clusters in data will be in <code>cluster</code> function. See <code>coxph()</code> for details. If random effects are specified in <code>sigma</code> and <code>cluster</code> is not specified, every subject forms its own cluster.
cureform	a formula expression similar to <code>formula</code> except that it does not contain a response. It is used to specify the effects of covariates on the cure rate. A covariate that defines clusters in data will be in <code>cluster</code> function as in <code>formula</code> . However, currently it is not used in the function because we assume that both components in cure model use the same cluster structure. If random effects are specified in <code>sigma</code> and <code>cluster</code> is not specified, every subject forms its own cluster.
data, subset, na.action	standard arguments for R model functions
bt	a vector of initial value of beta in the latency model. It is optional. If <code>survreg</code> is used to get initial values, <code>-survreg's bt/survreg's scale = bt</code>
gm	a vector of initial value of gamma in the incidence model. It is optional
basepara	a vector of initial values of the parameters in the baseline distribution. They are the log rate if <code>baseline = "exponential"</code> , log shape and log rate if <code>baseline = "weibull"</code> , and log hazard if <code>baseline = "piecewise"</code> . It is optional. If <code>survreg</code> is used to get initial values, then <code>survreg's scale = 1/weibull shape</code> and <code>survreg's intercept = -log(weibull rate)/weibull shape</code> if <code>basedist = "weibull"</code> , and <code>survreg's intercept = -log(rate)</code> if <code>basedist = "exponential"</code> . Inappropriate initial values can cause some problems in <code>adaptIntegrate</code> function.
sigma	a vector of 3 corresponding to log standard deviation of $u$ and $v$ , and a Fisher's $z$ -transformed correlation coefficient of $u$ and $v$ . If any of the value is set to NA, the corresponding effects will not be present in the model
optimcfg	a list of <code>method</code> , <code>maxit</code> , <code>reltol</code> , <code>hessian</code> , <code>ndeps</code> arguments for R function <code>optim()</code> . The default optimization method is Nelder-Mead.
intcfg	a list of <code>lower</code> , <code>upper</code> , <code>eps</code> to be passed onto an R integration function. If one random effect is specified, the built-in R integration function <code>integrate</code> is used. If two random effects are specified, R function <code>adaptIntegrate</code> from package <code>cubature</code> is used to do the integration.
basedist	type of baseline distribution. It can be one of <code>"exponential"</code> , <code>"weibull"</code> , or <code>"piecewise"</code> , where <code>"piecewise"</code> stands for piecewise constant hazard distribution. The default is <code>"exponential"</code> .
npiece, piececut, piececuttype	arguments for baseline distribution when it is piecewise constant hazard distribution. They are respectively the number of pieces, the cut points to form the pieces and how the pieces are formed. <code>piececut</code> should only include the interior time points and the length of <code>piececut</code> should be equal to <code>npiece - 1</code> . There are two ways to specify the piecewise constant hazard distribution: specify <code>piececut</code> or specify <code>npiece</code> and <code>piececuttype</code> . There are two possible

	types for piececuttype: "quantile" and "even". "quantile" is the default if not specified.
model	if TRUE, output model matrix instead of fitting the model
y, x, z	if TRUE, output corresponding matrix in the model matrix
funval	a logical value. If TRUE, evaluate the likelihood function at initial values instead of fitting the model
debug	for debug purpose

### Details

This package depends on cubature package for numerical integration and mvtnorm package. Better initial values for bt, gm and basepara obtained from a mixture cure model without random effects may help speed up the program or finding the best estimates.

### Value

an object of class intcure is returned. It includes all the values returned from `optim()` in addition to the following values:

call	The call to intcure
basedist	The baseline distribution fitted
method	The optimization method used
n	Sample size

### Examples

```
data(simdata)
intcure(Surv(time, cens) ~ rx + cluster(id), ~ rx, data = simdata,
basedist = "weibull", sigma = c(-1, NA, NA), optimcfg = list(maxit = 1000))
```

---

```
print.intcure          Print method for fitted mixture cure models with random effects
```

---

**Description**

It prints the estimates of the parameters in the model and the maximum likelihood value.

**Usage**

```
## S3 method for class 'intcure'
print(x, ...)
```

**Arguments**

```
x          an intcure object obtained from intcure
...        other standard printing arguments
```

**Value**

It will return the object in x. This function is called for side effects

**Author(s)**

Yingwei Peng

**See Also**

[intcure](#)

**Examples**

```
data(bmtfit)
print(bmtfit)
```

---

```
print.summary.intcure Print method for summary of fitted mixture cure models with random effects
```

---

**Description**

It prints the estimates of the parameters, standard errors, z-values, p-values, and the maximum likelihood value from a fitted mixture cure model with random effects.

**Usage**

```
## S3 method for class 'summary.intcure'
print(x, ...)
```

**Arguments**

x                    an `summary.intcure` object obtained from `summary()`  
...                    other standard printing arguments

**Value**

It will return the object in `x`. This function is called for side effects

**Author(s)**

Yingwei Peng

**See Also**

[intcure](#)

**Examples**

```
data(bmtfit)
print(summary(bmtfit))
```

---

simdata

*Simulated Data*

---

**Description**

This is a simulated data set for a testing purpose

**Usage**

```
data(simdata)
```

**Format**

A `data.frame` object with columns:

`time`: Survival time

`cens`: Censoring indicator

`rx`: A binary treatment variable

`id`: Cluster indicator

**Examples**

```
data(simdata)
```

---

`summary.intcure`*Summary of fitted mixture cure models with random effects*

---

**Description**

It calculates standard errors, z-values, and p-values of estimates from a fitted mixture cure model with random effects

**Usage**

```
## S3 method for class 'intcure'  
summary(object, ...)
```

**Arguments**

<code>object</code>	an intcure object obtained from intcure
<code>...</code>	inherited but not used here

**Value**

An object of class `summary.intcure` is returned. It is a list that includes all the components of class `intcure` plus an additional component `statistics`, which is a list of following components:

<code>bt</code>	a matrix with column <code>Estimate</code> , <code>Stderr</code> , <code>zvalue</code> , and <code>pvalue</code> for the estimated value of beta in the latency model
<code>gm</code>	a matrix with column <code>Estimate</code> , <code>Stderr</code> , <code>zvalue</code> , and <code>pvalue</code> for the estimated value of gamma in the incidence model
<code>basepara</code>	a matrix with column <code>Estimate</code> , <code>Stderr</code> , <code>zvalue</code> , and <code>pvalue</code> for the estimated value of the parameters in the baseline distribution
<code>sigma</code>	a matrix with column <code>Estimate</code> and <code>Stderr</code> for the random effects in the model
