

Package ‘ipdw’

July 22, 2020

Title Spatial Interpolation by Inverse Path Distance Weighting

Description Functions are provided to interpolate geo-referenced point data via Inverse Path Distance Weighting. Useful for coastal marine applications where barriers in the landscape preclude interpolation with Euclidean distances.

costrasterGen	<i>Generate a cost Raster</i>
---------------	-------------------------------

Description

Generate a cost raster from an object of class `SpatialPolygons`, `matrix`, or `SpatialPointsDataFrame`

Usage

```
costrasterGen(xymat, polys, extent = "polys", projstr, resolution = 1)
```

Arguments

<code>xymat</code>	Matrix of coordinates or a <code>SpatialPointsDataFrame</code> object
<code>polys</code>	<code>SpatialPolygons</code> object
<code>extent</code>	Define extent based on extent of <code>xymat/xyspdf</code> (points) or <code>polys</code> (polys). Default is <code>polys</code> .
<code>projstr</code>	proj4 string defining the output projection. An error will be thrown if <code>projstr</code> does not match the projection of the extent target. Pass <code>NULL</code> for non-geographic grids.
<code>resolution</code>	Numeric defaults to 1. See raster .

Details

Ensure that the projection of the `xymat` coordinates and `polys` match. This can be accomplished by running the `projection` command on both inputs. If they do not match use the `spTransform` command.

Value

`RasterLayer`

Author(s)

Joseph Stachelek

Examples

```
## Not run:
Sr1 <- Polygon(cbind(c(0, 0, 1, 1, 0), c(0, 12, 12, 0, 0)))
Sr4 <- Polygon(cbind(c(9, 9, 10, 10, 9), c(0, 12, 12, 0, 0)))
Sr2 <- Polygon(cbind(c(1, 1, 9, 9, 1), c(11, 12, 12, 11, 11)))
Sr3 <- Polygon(cbind(c(1, 1, 9, 9, 1), c(0, 1, 1, 0, 0)))
Sr5 <- Polygon(cbind(c(4, 4, 5, 5, 4), c(4, 8, 8, 4, 4)))
Srs1 <- Polygons(list(Sr1), "s1")
Srs2 <- Polygons(list(Sr2), "s2")
Srs3 <- Polygons(list(Sr3), "s3")
Srs4 <- Polygons(list(Sr4), "s4")
Srs5 <- Polygons(list(Sr5), "s5")

pols <- SpatialPolygons(list(Srs1, Srs2, Srs3, Srs4, Srs5), 1:5)

#using a matrix object
xymat <- matrix(3, 3, nrow = 1, ncol = 2)
costras <- costrasterGen(xymat, pols, projstr = NULL)

#plotting
plot(costras)
points(xymat)

## End(Not run)
```

errorGen

Generate interpolation error stats from validation datasets

Description

Generate error statistics from validation point datasets overlaid on a raster surface

Usage

```
errorGen(
  finalraster,
  validation.spdf,
  validation.data,
  plot = FALSE,
  title = ""
)
```

Arguments

```
finalraster    RasterLayer object
validation.spdf SpatialPointsDataFrame
```

```
validation.data      data.frame
plot                 logical. Plot comparison?
title                Plot labels
```

Value

List of error statistics

Author(s)

Joseph Stachelek

Examples

```
validation.data <- data.frame(rnorm(10, mean = 0.2, sd = 1))
names(validation.data) <- c("validation")
validation.spdf <- validation.data
validation.data <- as.numeric(unlist(validation.data))
xy <- data.frame(x = c(0:9), y = rep(1, 10))
coordinates(validation.spdf) <- xy

m <- matrix(NA, 1, 10)
out.ras <- raster(m, xmn = 0, xmx = ncol(m), ymn = 0, ymx = nrow(m))
out.ras[] <- validation.data + rnorm(ncell(out.ras), mean = 0.01, sd = 0.2)

valid.stats <- errorGen(out.ras, validation.spdf, validation.data, plot = TRUE,
title = "Validation Plot")
valid.stats
```

ipdw

Inverse Path Distance Weighting

Description

Interpolate geo-referenced point data using inverse path distance weighting.

Usage

```
ipdw(
  spdf,
  costras,
  range,
  paramlist,
  overlapped = FALSE,
  yearmon = "default",
  removefile = TRUE,
  step = 16,
```

```
    dist_power = 1,  
    trim_rstack = FALSE  
  )
```

Arguments

spdf	SpatialPointsDataFrame object
costras	RasterLayer. Cost raster
range	numeric. Range of interpolation neighborhood
paramlist	character. String representing parameter names
overlapped	logical. Default is FALSE, specify TRUE if some points lie on top of barriers
yearmon	character. String specifying the name of the spdf
removefile	logical. Remove files after processing?
step	numeric. Number of sub loops to manage memory during raster processing.
dist_power	numeric. Distance decay power (p)
trim_rstack	logical. Trim the raster output by the convex hull of spdf

Details

This is a high level function that interpolates a SpatialPointsDataFrame object in a single pass.

Points must be located within a single contiguous area. The presence of "landlocked" points will cause errors. It may be necessary to increase the value assigned to land areas when using a large range value in combination with a large sized cost rasters (grain x extent). In these cases, the value of land areas should be increased to ensure that it is always greater than the maximum accumulated cost path distance of any given geo-referenced point.

Value

RasterLayer

Author(s)

Joseph Stachelek

Examples

```
# see vignette
```

ipdwInterp

*Inverse Distance Weighting with custom distances***Description**

This function takes a rasterstack of pathdistances and generates surfaces by weighting parameter values by these distances

Usage

```
ipdwInterp(
  spdf,
  rstack,
  paramlist,
  overlapped = FALSE,
  yearmon = "default",
  removefile = TRUE,
  dist_power = 1,
  trim_rstack = FALSE
)
```

Arguments

spdf	SpatialPointsDataFrame object
rstack	RasterStack of path distances
paramlist	character. String representing parameter names
overlapped	logical. Default is FALSE, specify TRUE if some points lie on top of barriers
yearmon	character. String specifying the name of the spdf
removefile	logical. Remove files after processing?
dist_power	numeric. Distance decay power (p)
trim_rstack	logical. Trim the raster stack by the convex hull of spdf

Details

Under the hood, this function evaluates:

$$V = \frac{\sum_{i=1}^n v_i \frac{1}{d_i^p}}{\sum_{i=1}^n \frac{1}{d_i^p}}$$

where d is the distance between prediction and measurement points, v_i is the measured parameter value, and p is a power parameter.

Value

RasterLayer

Author(s)

Joseph Stachelek

Examples

```

spdf <- data.frame(rnorm(2))
xy <- data.frame(x = c(4, 2), y = c(8, 4))
coordinates(spdf) <- xy
m <- matrix(NA, 10, 10)
costras <- raster(m, xmn = 0, xmx = ncol(m), ymn = 0, ymx = nrow(m))

# introduce spatial gradient
costras[] <- runif(ncell(costras), min = 1, max = 10)
for(i in 1:nrow(costras)){
  costras[i,] <- costras[i,] + i
  costras[,i] <- costras[,i] + i
}

rstack <- pathdistGen(spdf, costras, 100, progressbar = FALSE)
final.raster <- ipdwInterp(spdf, rstack, paramlist = c("rnorm.2."), overlapped = TRUE)
plot(final.raster)
plot(spdf, add = TRUE)

```

pathdistGen

*Generate a stack of path distance raster objects***Description**

Generate a stack of path accumulated distance raster objects

Usage

```
pathdistGen(spdf, costras, range, yearmon = "default", progressbar = TRUE)
```

Arguments

spdf	SpatialPointsDataFrame object
costras	RasterLayer cost raster
range	numeric. Range of interpolation neighborhood
yearmon	character. String specifying the name of the spdf
progressbar	logical show progressbar during processing?

Value

RasterStack object of path distances

Author(s)

Joseph Stachelek

Examples

```
spdf <- data.frame(rnorm(2))
xy <- data.frame(x = c(4, 2), y = c(8, 4))
coordinates(spdf) <- xy

m <- matrix(NA, 10, 10)
costras <- raster(m, xmn = 0, xmx = ncol(m), ymn = 0, ymx = nrow(m))
costras[] <- runif(ncell(costras), min = 1, max = 10)
#introduce spatial gradient
for(i in 1:nrow(costras)){
  costras[i,] <- costras[i,] + i
  costras[,i] <- costras[,i] + i
}

rstack <- pathdistGen(spdf, costras, 100, progressbar = FALSE)
```

rm_na_pointslayers	<i>Remove NA SpatialPointsDataFrame features and drop corresponding raster stack layers</i>
--------------------	---

Description

Remove NA SpatialPointsDataFrame features and drop corresponding raster stack layers

Usage

```
rm_na_pointslayers(param_name, spdf, rstack)
```

Arguments

param_name	character name of data column
spdf	SpatialPointsDataFrame object
rstack	RasterStack or RasterBrick
