

# Package ‘lava’

March 5, 2020

**Type** Package

**Title** Latent Variable Models

**Version** 1.6.7

**Date** 2020-02-25

**Author** Klaus K. Holst [aut, cre],  
Brice Ozenne [ctb],  
Thomas Gerds [ctb]

**Maintainer** Klaus K. Holst <klaus@holst.it>

**Description** A general implementation of Structural Equation Models with latent variables (MLE, 2SLS, and composite likelihood estimators) with both continuous, censored, and ordinal outcomes (Holst and Budtz-Joergensen (2013) <doi:10.1007/s00180-012-0344-y>). Mixture latent variable models and non-linear latent variable models (Holst and Budtz-Joergensen (2019) <doi:10.1093/biostatistics/kxy082>). The package also provides methods for graph exploration (d-separation, back-door criterion), simulation of general non-linear latent variable models, and estimation of influence functions for a broad range of statistical models.

**URL** <https://github.com/kkholst/lava>

**BugReports** <https://github.com/kkholst/lava/issues>

**License** GPL-3

**LazyLoad** yes

**Depends** R (>= 3.0)

**Imports** grDevices, graphics, methods, numDeriv, stats, survival,  
SQUAREM, utils

**Suggests** KernSmooth, Matrix, Rgraphviz, data.table, ellipse, fields,  
foreach, geepack, gof (>= 0.9), graph, igraph (>= 0.6),  
lava.tobit (>= 0.4.7), lme4, mets (>= 1.1), nlme, optimx,  
polycor, quantreg, rgl, testthat (>= 0.11), visNetwork, zoo

**ByteCompile** yes

**Encoding** UTF-8

**RoxygenNote** 7.0.2

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2020-03-05 12:30:02 UTC

**lava-package**

*Estimation and simulation of latent variable models*

---

## Description

Framework for estimating parameters and simulate data from Latent Variable Models.

## Author(s)

Klaus K. Holst Maintainer: <klaus@holst.it>

## Examples

`lava()`

addvar	<i>Add variable to (model) object</i>
--------	---------------------------------------

**Description**

Generic method for adding variables to model object

**Usage**

```
addvar(x, ...)
```

**Arguments**

x	Model object
...	Additional arguments

**Author(s)**

Klaus K. Holst

backdoor	<i>Backdoor criterion</i>
----------	---------------------------

**Description**

Check backdoor criterion of a lvm object

**Usage**

```
backdoor(object, f, cond, ..., return.graph = FALSE)
```

**Arguments**

object	lvm object
f	formula. Conditioning, z, set can be given as $y \sim x   z$
cond	Vector of variables to condition on
...	Additional arguments to lower level functions
return.graph	Return moral ancestral graph with z and effects from x removed

**Examples**

```
m <- lvm(y~c2,c2~c1,x~c1,m1~x,y~m1, v1~c3, x~c3,v1~y,
           x~z1, z2~z1, z2~z3, y~z3+z2+g1+g2+g3)
l1 <- backdoor(m, y~x)
backdoor(m, y~x|c1+z1+g1)
```

---

baptize	<i>Label elements of object</i>
---------	---------------------------------

---

## Description

Generic method for labeling elements of an object

## Usage

```
baptize(x, ...)
```

## Arguments

x	Object
...	Additional arguments

## Author(s)

Klaus K. Holst

---

binomial.rd	<i>Define constant risk difference or relative risk association for binary exposure</i>
-------------	---

---

## Description

Set up model as defined in Richardson, Robins and Wang (2017).

## Usage

```
binomial.rd(
  x,
  response,
  exposure,
  target.model,
  nuisance.model,
  exposure.model = binomial.lvm(),
  ...
)
```

**Arguments**

x	model
response	response variable (character or formula)
exposure	exposure variable (character or formula)
target.model	variable defining the linear predictor for the target model
nuisance.model	variable defining the linear predictor for the nuisance model
exposure.model	model for exposure (default binomial logit link)
...	additional arguments to lower level functions

---

**blockdiag***Combine matrices to block diagonal structure*

---

**Description**

Combine matrices to block diagonal structure

**Usage**

```
blockdiag(x, ..., pad = 0)
```

**Arguments**

x	Matrix
...	Additional matrices
pad	Vvalue outside block-diagonal

**Author(s)**

Klaus K. Holst

**Examples**

```
A <- diag(3)+1  
blockdiag(A,A,A,pad=NA)
```

---

**bmd***Longitudinal Bone Mineral Density Data (Wide format)*

---

**Description**

Bone Mineral Density Data consisting of 112 girls randomized to receive calcium or placebo. Longitudinal measurements of bone mineral density ( $\text{g}/\text{cm}^2$ ) measured approximately every 6th month in 3 years.

**Format**

data.frame

**Source**

Vonesh & Chinchilli (1997), Table 5.4.1 on page 228.

**See Also**

calcium

---

**bmidata***Data*

---

**Description**

Description

**Format**

data.frame

---

**bootstrap***Generic bootstrap method*

---

**Description**

Generic method for calculating bootstrap statistics

**Usage**

```
bootstrap(x, ...)
```

**Arguments**

x	Model object
...	Additional arguments

**Author(s)**

Klaus K. Holst

**See Also**

`bootstrap.lvm` `bootstrap.lvmfit`

`bootstrap.lvm`

*Calculate bootstrap estimates of a lvm object*

**Description**

Draws non-parametric bootstrap samples

**Usage**

```
## S3 method for class 'lvm'
bootstrap(x,R=100,data,fun=NULL,control=list(),
          p, parametric=FALSE, bollenstine=FALSE,
          constraints=TRUE,sd=FALSE,messages=lava.options()$messages,
          parallel=lava.options()$parallel,
          mc.cores=NULL,
          ...)

## S3 method for class 'lvmfit'
bootstrap(x,R=100,data=model.frame(x),
          control=list(start=coef(x)),
          p=coef(x), parametric=FALSE, bollenstine=FALSE,
          estimator=x$estimator,weights=Weights(x),...)
```

**Arguments**

x	lvm-object.
R	Number of bootstrap samples
data	The data to resample from
fun	Optional function of the (bootstrapped) model-fit defining the statistic of interest
control	Options to the optimization routine
p	Parameter vector of the null model for the parametric bootstrap
parametric	If TRUE a parametric bootstrap is calculated. If FALSE a non-parametric (row-sampling) bootstrap is computed.

bollenstine	Bollen-Stine transformation (non-parametric bootstrap) for bootstrap hypothesis testing.
constraints	Logical indicating whether non-linear parameter constraints should be included in the bootstrap procedure
sd	Logical indicating whether standard error estimates should be included in the bootstrap procedure
messages	Control amount of messages printed
parallel	If TRUE parallel backend will be used
mc.cores	Number of threads (if NULL foreach::foreach will be used, otherwise parallel::mclapply)
...	Additional arguments, e.g. choice of estimator.
estimator	String defining estimator, e.g. 'gaussian' (see estimator)
weights	Optional weights matrix used by estimator

**Value**

A `bootstrap.lvm` object.

**Author(s)**

Klaus K. Holst

**See Also**

[confint.lvmfit](#)

**Examples**

```
m <- lvm(y~x)
d <- sim(m, 100)
e <- estimate(lvm(y~x), data=d)
## Reduce Ex.Timings
B <- bootstrap(e, R=50, parallel=FALSE)
B
```

**Description**

Simulated data

**Format**

`data.frame`

**Source**

Simulated

---

By*Apply a Function to a Data Frame Split by Factors*

---

**Description**

Apply a Function to a Data Frame Split by Factors

**Usage**

```
By(x, INDICES, FUN, COLUMNS, array = FALSE, ...)
```

**Arguments**

x	Data frame
INDICES	Indices (vector or list of indices, vector of column names, or formula of column names)
FUN	A function to be applied to data frame subsets of 'data'.
COLUMNS	(Optional) subset of columns of x to work on
array	if TRUE an array/matrix is always returned
...	Additional arguments to lower-level functions

**Details**

Simple wrapper of the 'by' function

**Author(s)**

Klaus K. Holst

**Examples**

```
By(datasets::CO2, ~Treatment+Type, colMeans, ~conc)
By(datasets::CO2, ~Treatment+Type, colMeans, ~conc+uptake)
```

---

calcium

*Longitudinal Bone Mineral Density Data*

---

### Description

Bone Mineral Density Data consisting of 112 girls randomized to receive calcium or placebo. Longitudinal measurements of bone mineral density ( $\text{g}/\text{cm}^2$ ) measured approximately every 6th month in 3 years.

### Format

A data.frame containing 560 (incomplete) observations. The 'person' column defines the individual girls of the study with measurements at visiting times 'visit', and age in years 'age' at the time of visit. The bone mineral density variable is 'bmd' ( $\text{g}/\text{cm}^2$ ).

### Source

Vonesh & Chinchilli (1997), Table 5.4.1 on page 228.

---

cancel

*Generic cancel method*

---

### Description

Generic cancel method

### Usage

`cancel(x, ...)`

### Arguments

x	Object
...	Additioal arguments

### Author(s)

Klaus K. Holst

---

children	<i>Extract children or parent elements of object</i>
----------	--

---

**Description**

Generic method for memberships from object (e.g. a graph)

**Usage**

```
children(object, ...)
```

**Arguments**

object	Object
...	Additional arguments

**Author(s)**

Klaus K. Holst

---

click	<i>Identify points on plot</i>
-------	--------------------------------

---

**Description**

Extension of the identify function

**Usage**

```
## Default S3 method:  
click(x, y=NULL, label=TRUE, n=length(x), pch=19, col="orange", cex=3, ...)  
idplot(x,y,...,id=list())
```

**Arguments**

x	X coordinates
...	Additional arguments parsed to plot function
y	Y coordinates
label	Should labels be added?
n	Max number of inputs to expect
pch	Symbol
col	Colour
cex	Size
id	List of arguments parsed to click function

## Details

For the usual 'X11' device the identification process is terminated by pressing any mouse button other than the first. For the 'quartz' device the process is terminated by pressing either the pop-up menu equivalent (usually second mouse button or 'Ctrl'-click) or the 'ESC' key.

## Author(s)

Klaus K. Holst

## See Also

[idplot](#), [identify](#)

## Examples

```
if (interactive()) {
  n <- 10; x <- seq(n); y <- runif(n)
  plot(y ~ x); click(x,y)

  data(iris)
  l <- lm(Sepal.Length ~ Sepal.Width*Species,iris)
  res <- plotConf(l,var2="Species")## ylim=c(6,8), xlim=c(2.5,3.3))
  with(res, click(x,y))

  with(iris, idplot(Sepal.Length,Petal.Length))
}
```

**closed.testing**      *Closed testing procedure*

## Description

Closed testing procedure

## Usage

```
closed.testing(
  object,
  idx = seq_along(coef(object)),
  null = rep(0, length(idx)),
  ...
)
```

## Arguments

object	estimate object
idx	Index of parameters to adjust for multiple testing
null	Null hypothesis value
...	Additional arguments

## Examples

```
m <- lvm()
regression(m, c(y1,y2,y3,y4,y5,y6,y7)~x) <- c(0,0.25,0,0.25,0.25,0,0)
regression(m, to=endogenous(m), from="u") <- 1
variance(m,endogenous(m)) <- 1
set.seed(2)
d <- sim(m,200)
l1 <- lm(y1~x,d)
l2 <- lm(y2~x,d)
l3 <- lm(y3~x,d)
l4 <- lm(y4~x,d)
l5 <- lm(y5~x,d)
l6 <- lm(y6~x,d)
l7 <- lm(y7~x,d)

(a <- merge(l1,l2,l3,l4,l5,l6,l7,subset=2))
if (requireNamespace("mets",quietly=TRUE)) {
  p.correct(a)
}
as.vector(closed.testing(a))
```

Col

*Generate a transparent RGB color*

## Description

This function transforms a standard color (e.g. "red") into an transparent RGB-color (i.e. alpha-blend<1).

## Usage

```
Col(col, alpha = 0.2, locate = 0)
```

## Arguments

col	Color (numeric or character)
alpha	Degree of transparency (0,1)
locate	Choose colour (with mouse)

## Details

This only works for certain graphics devices (Cairo-X11 (x11 as of R>=2.7), quartz, pdf, ...).

## Value

A character vector with elements of 7 or 9 characters, "'#" followed by the red, blue, green and optionally alpha values in hexadecimal (after rescaling to '0 ... 255').

**Author(s)**

Klaus K. Holst

**Examples**

```
plot(runif(1000),cex=runif(1000,0,4),col=Col(c("darkblue","orange"),0.5),pch=16)
```

**colorbar**

*Add color-bar to plot*

**Description**

Add color-bar to plot

**Usage**

```
colorbar(
  clut = Col(rev(rainbow(11, start = 0, end = 0.69)), alpha),
  x.range = c(-0.5, 0.5),
  y.range = c(-0.1, 0.1),
  values = seq(clut),
  digits = 2,
  label.offset,
  srt = 45,
  cex = 0.5,
  border = NA,
  alpha = 0.5,
  position = 1,
  direction = c("horizontal", "vertical"),
  ...
)
```

**Arguments**

clut	Color look-up table
x.range	x range
y.range	y range
values	label values
digits	number of digits
label.offset	label offset
srt	rotation of labels
cex	text size
border	border of color bar rectangles
alpha	Alpha (transparency) level 0-1

<code>position</code>	Label position left/bottom (1) or top/right (2) or no text (0)
<code>direction</code>	horizontal or vertical color bars
<code>...</code>	additional low level arguments (i.e. parsed to <code>text</code> )

**Examples**

```
## Not run:
plotNeuro(x,roi=R,mm=-18,range=5)
colorbar(clut=Col(rev(rainbow(11,start=0,end=0.69)),0.5),
          x=c(-40,40),y.range=c(84,90),values=c(-5:5))

colorbar(clut=Col(rev(rainbow(11,start=0,end=0.69)),0.5),
          x=c(-10,10),y.range=c(-100,50),values=c(-5:5),
          direction="vertical",border=1)

## End(Not run)
```

**Description**

Report estimates across different models

**Usage**

```
Combine(x, ...)
```

**Arguments**

<code>x</code>	list of model objects
<code>...</code>	additional arguments to lower-level functions

**Author(s)**

Klaus K. Holst

**Examples**

```
data(serotonin)
m1 <- lm(cau ~ age*gene1 + age*gene2,data=serotonin)
m2 <- lm(cau ~ age + gene1,data=serotonin)
m3 <- lm(cau ~ age*gene2,data=serotonin)

Combine(list(A=m1,B=m2,C=m3),fun=function(x)
  c("_____"="",R2=" " %+% format(summary(x)$r.squared,digits=2)))
```

commutation	<i>Finds the unique commutation matrix</i>
-------------	--

### Description

Finds the unique commutation matrix K:  $Kvec(A) = vec(A^t)$

### Usage

```
commutation(m, n = m)
```

### Arguments

m	rows
n	columns

### Author(s)

Klaus K. Holst

compare	<i>Statistical tests</i>
---------	--------------------------

### Description

Performs Likelihood-ratio, Wald and score tests

### Usage

```
compare(object, ...)
```

### Arguments

object	lvmfit-object
...	Additional arguments to low-level functions

### Value

Matrix of test-statistics and p-values

### Author(s)

Klaus K. Holst

**See Also**

[modelsearch](#), [equivalence](#)

**Examples**

```
m <- lvm();
regression(m) <- c(y1,y2,y3) ~ eta; latent(m) <- ~eta
regression(m) <- eta ~ x
m2 <- regression(m, c(y3,eta) ~ x)
set.seed(1)
d <- sim(m,1000)
e <- estimate(m,d)
e2 <- estimate(m2,d)

compare(e)

compare(e,e2) ## LRT, H0: y3<-x=0
compare(e,scoretest=y3~x) ## Score-test, H0: y3~x=0
compare(e2,par=c("y3~x")) ## Wald-test, H0: y3~x=0

B <- diag(2); colnames(B) <- c("y2~eta","y3~eta")
compare(e2,contrast=B,null=c(1,1))

B <- rep(0,length(coef(e2))); B[1:3] <- 1
compare(e2,contrast=B)

compare(e,scoretest=list(y3~x,y2~x))
```

**Description**

Estimate parameters in a probit latent variable model via a composite likelihood decomposition.

**Usage**

```
complik(
  x,
  data,
  k = 2,
  type = c("all", "nearest"),
  pairlist,
  messages = 0,
  estimator = "normal",
  quick = FALSE,
  ...
)
```

### Arguments

x	lvm-object
data	data.frame
k	Size of composite groups
type	Determines number of groups. With type="nearest" (default) only neighboring items will be grouped, e.g. for k=2 (y1,y2),(y2,y3),... With type="all" all combinations of size k are included
pairlist	A list of indices specifying the composite groups. Optional argument which overrides k and type but gives complete flexibility in the specification of the composite likelihood
messages	Control amount of messages printed
estimator	Model (pseudo-likelihood) to use for the pairs/groups
quick	If TRUE the parameter estimates are calculated but all additional information such as standard errors are skipped
...	Additional arguments parsed on to lower-level functions

### Value

An object of class `estimate.complik` inheriting methods from `lvm`

### Author(s)

Klaus K. Holst

### See Also

`estimate`

### Examples

```
m <- lvm(c(y1,y2,y3)~b*x+1*u[0],latent=~u)
ordinal(m,K=2) <- ~y1+y2+y3
d <- sim(m,50,seed=1)
e1 <- complik(m,d,control=list(trace=1),type="all")
```

`confband`

*Add Confidence limits bar to plot*

### Description

Add Confidence limits bar to plot

**Usage**

```
confband(
  x,
  lower,
  upper,
  center = NULL,
  line = TRUE,
  delta = 0.07,
  centermark = 0.03,
  pch,
  blank = TRUE,
  vert = TRUE,
  polygon = FALSE,
  step = FALSE,
  ...
)
```

**Arguments**

x	Position (x-coordinate if vert=TRUE, y-coordinate otherwise)
lower	Lower limit (if NULL no limits is added, and only the center is drawn (if not NULL))
upper	Upper limit
center	Center point
line	If FALSE do not add line between upper and lower bound
delta	Length of limit bars
centermark	Length of center bar
pch	Center symbol (if missing a line is drawn)
blank	If TRUE a white ball is plotted before the center is added to the plot
vert	If TRUE a vertical bar is plotted. Otherwise a horizontal bar is used
polygon	If TRUE polygons are added between 'lower' and 'upper'.
step	Type of polygon (step-function or piecewise linear)
...	Additional low level arguments (e.g. col, lwd, lty,...)

**Author(s)**

Klaus K. Holst

**See Also**

confband

## Examples

```

plot(0,0,type="n",xlab="",ylab="")
confband(0.5,-0.5,0.5,0,col="darkblue")

confint.lvmfit

*Calculate confidence limits for parameters*

## Description

Calculate Wald og Likelihood based (profile likelihood) confidence intervals

## Usage

```
## S3 method for class 'lvmfit'
confint(
  object,
  parm = seq_len(length(coef(object))),
  level = 0.95,
  profile = FALSE,
  curve = FALSE,
  n = 20,
  interval = NULL,
  lower = TRUE,
  upper = TRUE,
  ...
)
```

## Arguments

object	lvm-object.
parm	Index of which parameters to calculate confidence limits for.
level	Confidence level
profile	Logical expression defining whether to calculate confidence limits via the profile log likelihood
curve	if FALSE and profile is TRUE, confidence limits are returned. Otherwise, the profile curve is returned.
n	Number of points to evaluate profile log-likelihood in over the interval defined by <code>interval</code>
interval	Interval over which the profiling is done
lower	If FALSE the lower limit will not be estimated (profile intervals only)
upper	If FALSE the upper limit will not be estimated (profile intervals only)
...	Additional arguments to be passed to the low level functions

## Details

Calculates either Wald confidence limits:

$$\hat{\theta} \pm z_{\alpha/2} * \hat{\sigma}_{\hat{\theta}}$$

or profile likelihood confidence limits, defined as the set of value  $\tau$ :

$$\logLik(\hat{\theta}_\tau, \tau) - \logLik(\hat{\theta}) < q_\alpha/2$$

where  $q_\alpha$  is the  $\alpha$  fractile of the  $\chi^2_1$  distribution, and  $\hat{\theta}_\tau$  are obtained by maximizing the log-likelihood with tau being fixed.

## Value

A 2xp matrix with columns of lower and upper confidence limits

**Author(s)**

Klaus K. Holst

**Examples**

```
m <- lvm(y~x)
d <- sim(m,100)
e <- estimate(lvm(y~x), d)
confint(e,3,profile=TRUE)
confint(e,3)
## Reduce Ex.timings
B <- bootstrap(e,R=50)
B
```

*confpred*

*Conformal prediction*

**Description**

Conformal predictions

**Usage**

```
confpred(object, data, newdata = data, alpha = 0.05, mad, ...)
```

**Arguments**

<code>object</code>	Model object ( <code>lm</code> , <code>glm</code> or similar with <code>predict</code> method) or formula ( <code>lm</code> )
<code>data</code>	<code>data.frame</code>
<code>newdata</code>	New <code>data.frame</code> to make predictions for
<code>alpha</code>	Level of prediction interval
<code>mad</code>	Conditional model (formula) for the MAD (locally-weighted CP)
<code>...</code>	Additional arguments to lower level functions

**Value**

`data.frame` with fitted (`fit`), lower (`lwr`) and upper (`upr`) predictions bands.

## Examples

```

set.seed(123)
n <- 200
x <- seq(0,6,length.out=n)
delta <- 3
ss <- exp(-1+1.5*cos((x-delta)))
ee <- rnorm(n, sd=ss)
y <- (x-delta)+3*cos(x+4.5-delta)+ee
d <- data.frame(y=y, x=x)

newd <- data.frame(x=seq(0,6,length.out=50))
cc <- confpred(lm(y~splines::ns(x,knots=c(1,3,5)),data=d), data=d, newdata=newd)
if (interactive()) {
  plot(y~x,pch=16,col=lava::Col("black"),ylim=c(-10,10),xlab="X",ylab="Y")
  with(cc,
    lava::confband(newd$x,lwr,upr,fit,
      lwd=3,polygon=TRUE,col=Col("blue"),border=FALSE))
}

```

## Description

Add non-linear constraints to latent variable model

## Usage

```

## Default S3 replacement method:
constrain(x,par,args,...) <- value

## S3 replacement method for class 'multigroup'
constrain(x,par,k=1,...) <- value

constraints(object,data=model.frame(object),vcov=object$vcov,level=0.95,
            p=pars.default(object),k,idx,...)

```

## Arguments

x	lvm-object
...	Additional arguments to be passed to the low level functions
value	Real function taking args as a vector argument
par	Name of new parameter. Alternatively a formula with lhs specifying the new parameter and the rhs defining the names of the parameters or variable names defining the new parameter (overruling the args argument).
args	Vector of variables names or parameter names that are used in defining par

k	For multigroup models this argument specifies which group to add/extract the constraint
object	lvm-object
data	Data-row from which possible non-linear constraints should be calculated
vcov	Variance matrix of parameter estimates
level	Level of confidence limits
p	Parameter vector
idx	Index indicating which constraints to extract

## Details

Add non-linear parameter constraints as well as non-linear associations between covariates and latent or observed variables in the model (non-linear regression).

As an example we will specify the follow multiple regression model:

$$E(Y|X_1, X_2) = \alpha + \beta_1 X_1 + \beta_2 X_2$$

$$V(Y|X_1, X_2) = v$$

which is defined (with the appropriate parameter labels) as

```
m <- lvm(y ~ f(x, beta1) + f(x, beta2))
intercept(m) <- y ~ f(alpha)
covariance(m) <- y ~ f(v)
```

The somewhat strained parameter constraint

$$v = \frac{(\beta_1 - \beta_2)^2}{\alpha}$$

can then specified as

```
constrain(m, v ~ beta1 + beta2 + alpha) <- function(x) (x[1]-x[2])^2/x[3]
```

A subset of the arguments `args` can be covariates in the model, allowing the specification of non-linear regression models. As an example the non-linear regression model

$$E(Y | X) = \nu + \Phi(\alpha + \beta X)$$

where  $\Phi$  denotes the standard normal cumulative distribution function, can be defined as

```
m <- lvm(y ~ f(x, 0)) # No linear effect of x
```

Next we add three new parameters using the parameter assignment function:

```
parameter(m) <-~nu+alpha+beta
```

The intercept of  $Y$  is defined as `mu`

```
intercept(m) <- y ~ f(mu)
```

And finally the newly added intercept parameter `mu` is defined as the appropriate non-linear function of  $\alpha$ ,  $\nu$  and  $\beta$ :

```
constrain(m,mu ~ x + alpha + nu) <-function(x) pnorm(x[1]*x[2])+x[3]
```

The constraints function can be used to show the estimated non-linear parameter constraints of an estimated model object (`lvmfit` or `multigroupfit`). Calling `constrain` with no additional arguments beyond `x` will return a list of the functions and parameter names defining the non-linear restrictions.

The gradient function can optionally be added as an attribute `grad` to the return value of the function defined by `value`. In this case the analytical derivatives will be calculated via the chain rule when evaluating the corresponding score function of the log-likelihood. If the `gradient` attribute is omitted the chain rule will be applied on a numeric approximation of the gradient.

### Value

A `lvm` object.

e2

```

contr

*Create contrast matrix***Description**

Create contrast matrix typically for use with 'estimate' (Wald tests).

**Usage**

```
contr(p, n, diff = TRUE, ...)
```

**Arguments**

- p index of non-zero entries (see example)
- n Total number of parameters (if omitted the max number in p will be used)
- diff If FALSE all non-zero entries are +1, otherwise the second non-zero element in each row will be -1.
- ... Additional arguments to lower level functions

**Examples**

```
contr(2,n=5)
contr(as.list(2:4),n=5)
contr(list(1,2,4),n=5)
contr(c(2,3,4),n=5)
contr(list(c(1,3),c(2,4)),n=5)
contr(list(c(1,3),c(2,4),5))

parsedesign(c("aa","b","c"),"?","?",diff=c(FALSE,TRUE))
```

**correlation***Generic method for extracting correlation coefficients of model object***Description**

Generic correlation method

```
correlation(x, ...)
```

**Arguments**

- x Object
- ... Additional arguments

**Author(s)**

Klaus K. Holst

covariance

*Add covariance structure to Latent Variable Model***Description**

Define covariances between residual terms in a `lvm`-object.

**Usage**

```
## S3 replacement method for class 'lvm'
covariance(object, var1=NULL, var2=NULL, constrain=FALSE, pairwise=FALSE, ...) <- value
```

**Arguments**

<code>object</code>	<code>lvm</code> -object
<code>...</code>	Additional arguments to be passed to the low level functions
<code>var1</code>	Vector of variables names (or formula)
<code>var2</code>	Vector of variables names (or formula) defining pairwise covariance between <code>var1</code> and <code>var2</code> )
<code>constrain</code>	Define non-linear parameter constraints to ensure positive definite structure
<code>pairwise</code>	If TRUE and <code>var2</code> is omitted then pairwise correlation is added between all variables in <code>var1</code>
<code>value</code>	List of parameter values or (if <code>var1</code> is unspecified)

**Details**

The covariance function is used to specify correlation structure between residual terms of a latent variable model, using a formula syntax.

For instance, a multivariate model with three response variables,

$$Y_1 = \mu_1 + \epsilon_1$$

$$Y_2 = \mu_2 + \epsilon_2$$

$$Y_3 = \mu_3 + \epsilon_3$$

can be specified as

```
m <- lvm(~y1+y2+y3)
```

Pr. default the two variables are assumed to be independent. To add a covariance parameter  $r = cov(\epsilon_1, \epsilon_2)$ , we execute the following code

```
covariance(m) <- y1 ~ f(y2, r)
```

The special function `f` and its second argument could be omitted thus assigning an unique parameter the covariance between `y1` and `y2`.

Similarly the marginal variance of the two response variables can be fixed to be identical ( $\text{var}(Y_i) = v$ ) via

```
covariance(m) <-c(y1,y2,y3) ~ f(v)
```

To specify a completely unstructured covariance structure, we can call

```
covariance(m) <-~y1+y2+y3
```

All the parameter values of the linear constraints can be given as the right handside expression of the assignment function `covariance<-` if the first (and possibly second) argument is defined as well. E.g:

```
covariance(m,y1~y1+y2) <-list("a1","b1")
```

```
covariance(m,~y2+y3) <-list("a2",2)
```

Defines

$$\text{var}(\epsilon_1) = a1$$

$$\text{var}(\epsilon_2) = a2$$

$$\text{var}(\epsilon_3) = 2$$

$$\text{cov}(\epsilon_1, \epsilon_2) = b1$$

Parameter constraints can be cleared by fixing the relevant parameters to `NA` (see also the `regression` method).

The function `covariance` (called without additional arguments) can be used to inspect the covariance constraints of a `lvm`-object.

### Value

A `lvm`-object

### Author(s)

Klaus K. Holst

### See Also

`regression<-, intercept<-, constrain<-, parameter<-, latent<-, cancel<-, kill<-`

## Examples

```
m <- lvm()
### Define covariance between residuals terms of y1 and y2
covariance(m) <- y1~y2
covariance(m) <- c(y1,y2)~f(v) ## Same marginal variance
covariance(m) ## Examine covariance structure
```

**csplit**

*Split data into folds*

## Description

Split data into folds

## Usage

```
csplit(x, p = NULL, replace = FALSE, return.index = FALSE, k = 2, ...)
```

## Arguments

x	Data or integer (size)
p	Number of folds, or if a number between 0 and 1 is given two folds of size p and (1-p) will be returned
replace	With or with-out replacement
return.index	If TRUE index of folds are returned otherwise the actual data splits are returned (default)
k	(Optional, only used when p=NULL) number of folds without shuffling
...	additional arguments to lower-level functions

## Author(s)

Klaus K. Holst

## Examples

```
foldr(5,2,rep=2)
csplit(10,3)
csplit(iris[1:10,]) ## Split in two sets 1:(n/2) and (n/2+1):n
csplit(iris[1:10,],0.5)
```

---

curly	<i>Adds curly brackets to plot</i>
-------	------------------------------------

---

## Description

Adds curly brackets to plot

## Usage

```
curly(  
  x,  
  y,  
  len = 1,  
  theta = 0,  
  wid,  
  shape = 1,  
  col = 1,  
  lwd = 1,  
  lty = 1,  
  grid = FALSE,  
  npoints = 50,  
  text = NULL,  
  offset = c(0.05, 0)  
)
```

## Arguments

x	center of the x axis of the curly brackets (or start end coordinates (x1,x2))
y	center of the y axis of the curly brackets (or start end coordinates (y1,y2))
len	Length of the curly brackets
theta	angle (in radians) of the curly brackets orientation
wid	Width of the curly brackets
shape	shape (curvature)
col	color (passed to lines/grid.lines)
lwd	line width (passed to lines/grid.lines)
lty	line type (passed to lines/grid.lines)
grid	If TRUE use grid graphics (compatability with ggplot2)
npoints	Number of points used in curves
text	Label
offset	Label offset (x,y)

## Examples

```
if (interactive()) {
  plot(0,0,type="n",axes=FALSE,xlab="",ylab="")
  curly(x=c(1,0),y=c(0,1),lwd=2,text="a")
  curly(x=c(1,0),y=c(0,1),lwd=2,text="b",theta=pi)
  curly(x=-0.5,y=0,shape=1,theta=pi,text="c")
  curly(x=0,y=0,shape=1,theta=0,text="d")
  curly(x=0.5,y=0,len=0.2,theta=pi/2,col="blue",lty=2)
  curly(x=0.5,y=-0.5,len=0.2,theta=-pi/2,col="red",shape=1e3,text="e")
}
```

cv

*Cross-validation*

## Description

Cross-validation

## Usage

```
cv(
  modelList,
  data,
  K = 5,
  rep = 1,
  perf,
  seed = NULL,
  mc.cores = 1,
  shared = NULL,
  ...
)
```

## Arguments

<code>modelList</code>	List of fitting functions or models
<code>data</code>	<code>data.frame</code>
<code>K</code>	Number of folds (default 5, 0 splits in 1:n/2, n/2:n with last part used for testing)
<code>rep</code>	Number of repetitions (default 1)
<code>perf</code>	Performance measure (default RMSE)
<code>seed</code>	Optional random seed
<code>mc.cores</code>	Number of cores used for parallel computations
<code>shared</code>	function applied to each fold with results send to each model
<code>...</code>	Additional arguments parsed to models in <code>modelList</code> and <code>perf</code>

**Details**

Generic cross-validation function

**Author(s)**

Klaus K. Holst

**Examples**

```
f0 <- function(data,...) lm(...,data)
f1 <- function(data,...) lm(Sepal.Length~Species,data)
f2 <- function(data,...) lm(Sepal.Length~Species+Petal.Length,data)
x <- cv(list(m0=f0,m1=f1,m2=f2),rep=10, data=iris, formula=Sepal.Length~.)
x2 <- cv(list(f0(iris),f1(iris),f2(iris)),rep=10, data=iris)
```

---

devcoords

*Returns device-coordinates and plot-region*

---

**Description**

Returns device-coordinates and plot-region

**Usage**

```
devcoords()
```

**Value**

A list with elements

dev.x1	Device: Left x-coordinate
dev.x2	Device: Right x-coordinate
dev.y1	Device Bottom y-coordinate
dev.y2	Device Top y-coordinate
fig.x1	Plot: Left x-coordinate
fig.x2	Plot: Right x-coordinate
fig.y1	Plot: Bottom y-coordinate
fig.y2	Plot: Top y-coordinate

**Author(s)**

Klaus K. Holst

**diagtest***Calculate diagnostic tests for 2x2 table***Description**

Calculate prevalence, sensitivity, specificity, and positive and negative predictive values

**Usage**

```
diagtest(
  table,
  positive = 2,
  exact = FALSE,
  p0 = NA,
  confint = c("logit", "arcsin", "pseudoscore", "exact"),
  ...
)
```

**Arguments**

<code>table</code>	Table or (matrix/data.frame with two columns)
<code>positive</code>	Switch reference
<code>exact</code>	If TRUE exact binomial proportions CI/test will be used
<code>p0</code>	Optional null hypothesis (test prevalence, sensitivity, ...)
<code>confint</code>	Type of confidence limits
<code>...</code>	Additional arguments to lower level functions

**Details**

Table should be in the format with outcome in columns and test in rows. Data.frame should be with test in the first column and outcome in the second column.

**Author(s)**

Klaus Holst

**Examples**

```
M <- as.table(matrix(c(42,12,
                      35,28),ncol=2,byrow=TRUE,
                      dimnames=list(rater=c("no","yes"),gold=c("no","yes"))))
diagtest(M,exact=TRUE)
```

---

<code>dsep.lvm</code>	<i>Check d-separation criterion</i>
-----------------------	-------------------------------------

---

## Description

Check for conditional independence (d-separation)

## Usage

```
## S3 method for class 'lvm'
dsep(object, x, cond = NULL, return.graph = FALSE, ...)
```

## Arguments

<code>object</code>	lvm object
<code>x</code>	Variables for which to check for conditional independence
<code>cond</code>	Conditioning set
<code>return.graph</code>	If TRUE the moralized ancestral graph with the conditioning set removed is returned
<code>...</code>	Additional arguments to lower level functions

## Details

The argument '`x`' can be given as a formula, e.g. `x~y|z+v` or `~x+y|z+v` With everything on the rhs of the bar defining the variables on which to condition on.

## Examples

```
m <- lvm(x5 ~ x4+x3, x4~x3+x1, x3~x2, x2~x1)
if (interactive()) {
  plot(m, layoutType='neato')
}
dsep(m, x5~x1|x2+x4)
dsep(m, x5~x1|x3+x4)
dsep(m, ~x1+x2+x3|x4)
```

<code>equivalence</code>	<i>Identify candidates of equivalent models</i>
--------------------------	---

**Description**

Identifies candidates of equivalent models

**Usage**

```
equivalence(x, rel, tol = 0.001, k = 1, omitrel = TRUE, ...)
```

**Arguments**

<code>x</code>	lvmfit-object
<code>rel</code>	Formula or character-vector specifying two variables to omit from the model and subsequently search for possible equivalent models
<code>tol</code>	Define two models as empirical equivalent if the absolute difference in score test is less than <code>tol</code>
<code>k</code>	Number of parameters to test simultaneously. For <code>equivalence</code> the number of additional associations to be added instead of <code>rel</code> .
<code>omitrel</code>	if <code>k</code> greater than 1, this boolean defines whether to omit candidates containing <code>rel</code> from the output
<code>...</code>	Additional arguments to be passed to the lower-level functions

**Author(s)**

Klaus K. Holst

<code>estimate.default</code>	<i>Estimation of functional of parameters</i>
-------------------------------	---

**Description**

Estimation of functional of parameters. Wald tests, robust standard errors, cluster robust standard errors, LRT (when `f` is not a function)...

**Usage**

```
## Default S3 method:
estimate(
  x = NULL,
  f = NULL,
  ...,
  data,
  id,
  iddata,
  stack = TRUE,
  average = FALSE,
  subset,
  score.deriv,
  level = 0.95,
  iid = robust,
  type = c("robust", "df", "mbn"),
  keep,
  use,
  regex = FALSE,
  contrast,
  null,
  vcov,
  coef,
  robust = TRUE,
  df = NULL,
  print = NULL,
  labels,
  label.width,
  only.coef = FALSE,
  back.transform = NULL,
  folds = 0,
  cluster,
  R = 0,
  null.sim
)
```

**Arguments**

x	model object (glm, lvmfit, ...)
f	transformation of model parameters and (optionally) data, or contrast matrix (or vector)
...	additional arguments to lower level functions
data	data.frame
id	(optional) id-variable corresponding to iid decomposition of model parameters.
iddata	(optional) id-variable for 'data'
stack	if TRUE (default) the i.i.d. decomposition is automatically stacked according to 'id'

<b>average</b>	if TRUE averages are calculated
<b>subset</b>	(optional) subset of data.frame on which to condition (logical expression or variable name)
<b>score.deriv</b>	(optional) derivative of mean score function
<b>level</b>	level of confidence limits
<b>iid</b>	if TRUE (default) the iid decompositions are also returned (extract with <b>iid</b> method)
<b>type</b>	type of small-sample correction
<b>keep</b>	(optional) index of parameters to keep from final result
<b>use</b>	(optional) index of parameters to use in calculations
<b>regex</b>	If TRUE use regular expression (perl compatible) for <b>keep,use</b> arguments
<b>contrast</b>	(optional) Contrast matrix for final Wald test
<b>null</b>	(optional) null hypothesis to test
<b>vcov</b>	(optional) covariance matrix of parameter estimates (e.g. Wald-test)
<b>coef</b>	(optional) parameter coefficient
<b>robust</b>	if TRUE robust standard errors are calculated. If FALSE p-values for linear models are calculated from t-distribution
<b>df</b>	degrees of freedom (default obtained from 'df.residual')
<b>print</b>	(optional) print function
<b>labels</b>	(optional) names of coefficients
<b>label.width</b>	(optional) max width of labels
<b>only.coef</b>	if TRUE only the coefficient matrix is return
<b>back.transform</b>	(optional) transform of parameters and confidence intervals
<b>folds</b>	(optional) aggregate influence functions (divide and conquer)
<b>cluster</b>	(obsolete) alias for 'id'.
<b>R</b>	Number of simulations (simulated p-values)
<b>null.sim</b>	Mean under the null for simulations

## Details

**iid** decomposition

$$\sqrt{n}(\hat{\theta} - \theta) = \sum_{i=1}^n \epsilon_i + o_p(1)$$

can be extracted with the **iid** method.

## Marginalize
f <- function(p,data)
  list(p0=lava:::expit(p["(Intercept)"] + p["z"]*data[,"z"]),
       p1=lava:::expit(p["(Intercept)"] + p["x"] + p["z"]*data[,"z"]))
e <- estimate(g, f, average=TRUE)
e
estimate(e,diff)
estimate(e,cbind(1,1))

## Clusters and subset (conditional marginal effects)
d$id <- rep(seq(nrow(d)/4),each=4)
estimate(g,function(p,data)
  list(p0=lava:::expit(p[1] + p["z"]*data[,"z"])),
  subset=d$z>0, id=d$id, average=TRUE)

## More examples with clusters:
m <- lvm(c(y1,y2,y3)~u+x)
d <- sim(m,10)
l1 <- glm(y1~x,data=d)
l2 <- glm(y2~x,data=d)
l3 <- glm(y3~x,data=d)

## Some random id-numbers
id1 <- c(1,1,4,1,3,1,2,3,4,5)
id2 <- c(1,2,3,4,5,6,7,8,1,1)
id3 <- seq(10)

## Un-stacked and stacked i.i.d. decomposition
iid(estimate(l1,id=id1,stack=FALSE))
iid(estimate(l1,id=id1))

## Combined i.i.d. decomposition
e1 <- estimate(l1,id=id1)
e2 <- estimate(l2,id=id2)
e3 <- estimate(l3,id=id3)
(a2 <- merge(e1,e2,e3))

## If all models were estimated on the same data we could use the
## syntax:
## Reduce(merge,estimate(list(l1,l2,l3)))

## Same:
iid(a1 <- merge(l1,l2,l3,id=list(id1,id2,id3)))

iid(merge(l1,l2,l3,id=TRUE)) # one-to-one (same clusters)
iid(merge(l1,l2,l3,id=FALSE)) # independence

## Monte Carlo approach, simple trend test example

m <- categorical(lvm(),~x,K=5)
regression(m,additive=TRUE) <- y~x
d <- simulate(m,100,seed=1,'y~x'=0.1)

```

```

l <- lm(y~1+factor(x),data=d)

f <- function(x) coef(lm(x~seq_along(x)))[2]
null <- rep(mean(coef(l)),length(coef(l))) ## just need to make sure we simulate under H0: slope=0
estimate(l,f,R=1e2,null.sim=null)

estimate(l,f)

```

## Description

Estimate parameters. MLE, IV or user-defined estimator.

## Usage

```

## S3 method for class 'lvm'
estimate(
  x,
  data = parent.frame(),
  estimator = NULL,
  control = list(),
  missing = FALSE,
  weights,
  weightsname,
  data2,
  id,
  fix,
  index = !quick,
  graph = FALSE,
  messages = lava.options()$messages,
  quick = FALSE,
  method,
  param,
  cluster,
  p,
  ...
)

```

## Arguments

x	lvm-object
data	data.frame
estimator	String defining the estimator (see details below)
control	control/optimization parameters (see details below)

<code>missing</code>	Logical variable indicating how to treat missing data. Setting to FALSE leads to complete case analysis. In the other case likelihood based inference is obtained by integrating out the missing data under assumption the assumption that data is missing at random (MAR).
<code>weights</code>	Optional weights to be used by the chosen estimator.
<code>weightsname</code>	Weights names (variable names of the model) in case <code>weights</code> was given as a vector of column names of <code>data</code> .
<code>data2</code>	Optional additional dataset used by the chosen estimator.
<code>id</code>	Vector (or name of column in <code>data</code> ) that identifies correlated groups of observations in the data leading to variance estimates based on a sandwich estimator
<code>fix</code>	Logical variable indicating whether parameter restriction automatically should be imposed (e.g. intercepts of latent variables set to 0 and at least one regression parameter of each measurement model fixed to ensure identifiability.)
<code>index</code>	For internal use only
<code>graph</code>	For internal use only
<code>messages</code>	Control how much information should be printed during estimation (0: none)
<code>quick</code>	If TRUE the parameter estimates are calculated but all additional information such as standard errors are skipped
<code>method</code>	Optimization method
<code>param</code>	set parametrization (see <code>help(lava.options)</code> )
<code>cluster</code>	Obsolete. Alias for 'id'.
<code>p</code>	Evaluate model in parameter 'p' (no optimization)
<code>...</code>	Additional arguments to be passed to lower-level functions

## Details

A list of parameters controlling the estimation and optimization procedures is parsed via the `control` argument. By default Maximum Likelihood is used assuming multivariate normal distributed measurement errors. A list with one or more of the following elements is expected:

**start:** Starting value. The order of the parameters can be shown by calling `coef` (with `mean=TRUE`) on the `lvm`-object or with `plot(..., labels=TRUE)`. Note that this requires a check that it is actual the model being estimated, as `estimate` might add additional restriction to the model, e.g. through the `fix` and `exo.fix` arguments. The `lvm`-object of a fitted model can be extracted with the `Model`-function.

**starterfun:** Starter-function with syntax `function(lvm, S, mu)`. Three builtin functions are available: `startvalues`, `startvalues0`, `startvalues1`, ...

**estimator:** String defining which estimator to use (Defaults to "gaussian")

**meanstructure** Logical variable indicating whether to fit model with meanstructure.

**method:** String pointing to alternative optimizer (e.g. `optim` to use simulated annealing).

**control:** Parameters passed to the optimizer (default `stats:::nlminb`).

**tol:** Tolerance of optimization constraints on lower limit of variance parameters.

**Value**

A lvmfit-object.

covariance(mm,~u) <- NA
intercept(mm,~u) <- NA
ee <- estimate(list(mm,mm),list(d1,d2))

## Missing data
d0 <- makemissing(d1,cols=1:2)
e0 <- estimate(m,d0,missing=TRUE)
e0
```

---

eventTime	<i>Add an observed event time outcome to a latent variable model.</i>
-----------	---

---

## Description

For example, if the model 'm' includes latent event time variables are called 'T1' and 'T2' and 'C' is the end of follow-up (right censored), then one can specify

## Usage

```
eventTime(object, formula, eventName = "status", ...)
```

## Arguments

object	Model object
formula	Formula (see details)
eventName	Event names
...	Additional arguments to lower levels functions

## Details

```
eventTime(object=m, formula=ObsTime~min(T1=a, T2=b, C=0, "ObsEvent"))
```

when data are simulated from the model one gets 2 new columns:

- "ObsTime": the smallest of T1, T2 and C - "ObsEvent": 'a' if T1 is smallest, 'b' if T2 is smallest and '0' if C is smallest

Note that "ObsEvent" and "ObsTime" are names specified by the user.

## Author(s)

Thomas A. Gerds, Klaus K. Holst

## Examples

```
# Right censored survival data without covariates
m0 <- lvm()
distribution(m0,"eventtime") <- coxWeibull.lvm(scale=1/100,shape=2)
distribution(m0,"censtime") <- coxExponential.lvm(rate=10)
m0 <- eventTime(m0,time~min(eventtime=1,censtime=0),"status")
sim(m0,10)

# Alternative specification of the right censored survival outcome
## eventTime(m, "Status") <- ~min(eventtime=1,censtime=0)

# Cox regression:
# lava implements two different parametrizations of the same
# Weibull regression model. The first specifies
```

```

# the effects of covariates as proportional hazard ratios
# and works as follows:
m <- lvm()
distribution(m,"eventtime") <- coxWeibull.lvm(scale=1/100,shape=2)
distribution(m,"censtime") <- coxWeibull.lvm(scale=1/100,shape=2)
m <- eventTime(m,time~min(eventtime=1,censtime=0),"status")
distribution(m,"sex") <- binomial.lvm(p=0.4)
distribution(m,"sbp") <- normal.lvm(mean=120,sd=20)
regression(m,from="sex",to="eventtime") <- 0.4
regression(m,from="sbp",to="eventtime") <- -0.01
sim(m,6)
# The parameters can be recovered using a Cox regression
# routine or a Weibull regression model. E.g.,
## Not run:
set.seed(18)
d <- sim(m,1000)
library(survival)
coxph(Surv(time,status)~sex+sbp,data=d)

sr <- survreg(Surv(time,status)~sex+sbp,data=d)
library(SurvRegCensCov)
ConvertWeibull(sr)

## End(Not run)

# The second parametrization is an accelerated failure time
# regression model and uses the function weibull.lvm instead
# of coxWeibull.lvm to specify the event time distributions.
# Here is an example:

ma <- lvm()
distribution(ma,"eventtime") <- weibull.lvm(scale=3,shape=0.7)
distribution(ma,"censtime") <- weibull.lvm(scale=2,shape=0.7)
ma <- eventTime(ma,time~min(eventtime=1,censtime=0),"status")
distribution(ma,"sex") <- binomial.lvm(p=0.4)
distribution(ma,"sbp") <- normal.lvm(mean=120,sd=20)
regression(ma,from="sex",to="eventtime") <- 0.7
regression(ma,from="sbp",to="eventtime") <- -0.008
set.seed(17)
sim(ma,6)
# The regression coefficients of the AFT model
# can be tranformed into log(hazard ratios):
# coef.coxWeibull = - coef.weibull / shape.weibull
## Not run:
set.seed(17)
da <- sim(ma,1000)
library(survival)
fa <- coxph(Surv(time,status)~sex+sbp,data=da)
coef(fa)
c(0.7,-0.008)/0.7

## End(Not run)

```

```

# The Weibull parameters are related as follows:
# shape.coxWeibull = 1/shape.weibull
# scale.coxWeibull = exp(-scale.weibull/shape.weibull)
# scale.AFT = log(scale.coxWeibull) / shape.coxWeibull
# Thus, the following are equivalent parametrizations
# which produce exactly the same random numbers:

model.aft <- lvm()
distribution(model.aft,"eventtime") <- weibull.lvm(scale=-log(1/100)/2,shape=0.5)
distribution(model.aft,"censtime") <- weibull.lvm(scale=-log(1/100)/2,shape=0.5)
set.seed(17)
sim(model.aft,6)

model.cox <- lvm()
distribution(model.cox,"eventtime") <- coxWeibull.lvm(scale=1/100,shape=2)
distribution(model.cox,"censtime") <- coxWeibull.lvm(scale=1/100,shape=2)
set.seed(17)
sim(model.cox,6)

# The minimum of multiple latent times one of them still
# being a censoring time, yield
# right censored competing risks data

mc <- lvm()
distribution(mc,~X2) <- binomial.lvm()
regression(mc) <- T1~f(X1,-.5)+f(X2,0.3)
regression(mc) <- T2~f(X2,0.6)
distribution(mc,~T1) <- coxWeibull.lvm(scale=1/100)
distribution(mc,~T2) <- coxWeibull.lvm(scale=1/100)
distribution(mc,~C) <- coxWeibull.lvm(scale=1/100)
mc <- eventTime(mc,time~min(T1=1,T2=2,C=0),"event")
sim(mc,6)

```

**Expand***Create a Data Frame from All Combinations of Factors***Description**

Create a Data Frame from All Combinations of Factors

**Usage**

Expand(`\_data`, ...)

**Arguments**

_data	Data.frame
...	vectors, factors or a list containing these

**Details**

Simple wrapper of the 'expand.grid' function. If x is a table then a data frame is returned with one row pr individual observation.

**Author(s)**

Klaus K. Holst

**Examples**

```
dd <- Expand(iris, Sepal.Length=2:8, Species=c("virginica","setosa"))
summary(dd)

T <- with(warpbreaks, table(wool, tension))
Expand(T)
```

---

*fplot**fplot*

---

**Description**

Faster plot via RGL

**Usage**

```
fplot(
  x,
  y,
  z = NULL,
  xlab,
  ylab,
  ...,
  z.col = topo.colors(64),
  data = parent.frame(),
  add = FALSE,
  aspect = c(1, 1),
  zoom = 0.8
)
```

**Arguments**

x	X variable
y	Y variable
z	Z variable (optional)
xlab	x-axis label
ylab	y-axis label
...	additional argument to lower-level plot functions
z.col	color (use argument alpha to set transparency)
data	data.frame
add	if TRUE use current active device
aspect	aspect ratio
zoom	zoom level

**Examples**

```
if (interactive()) {
  data(iris)
  fplot(Sepal.Length ~ Petal.Length+Species, data=iris, size=2, type="s")
}
```

getMplus

*Read Mplus output***Description**

Read Mplus output files

**Usage**

```
getMplus(infile = "template.out", coef = TRUE, ...)
```

**Arguments**

infile	Mplus output file
coef	Coefficients only
...	additional arguments to lower level functions

**Author(s)**

Klaus K. Holst

getSAS

---

getSAS

*Read SAS output*

---

## Description

Run SAS code like in the following:

## Usage

```
getSAS(infile, entry = "Parameter Estimates", ...)
```

## Arguments

infile	file (csv file generated by ODS)
entry	Name of entry to capture
...	additional arguments to lower level functions

## Details

```
ODS CSVALL BODY="myest.csv"; proc nlmixed data=aj qpoints=2 dampstep=0.5; ... run; ODS  
CSVALL Close;
```

and read results into R with:

```
getsas("myest.csv", "Parameter Estimates")
```

gof

*Extract model summaries and GOF statistics for model object*

---

## Description

Calculates various GOF statistics for model object including global chi-squared test statistic and AIC. Extract model-specific mean and variance structure, residuals and various predictions.

**Usage**

```

gof(object, ...)

## S3 method for class 'lvmfit'
gof(object, chisq=FALSE, level=0.90, rmsea.threshold=0.05, all=FALSE, ...)

moments(x, ...)

## S3 method for class 'lvm'
moments(x, p, debug=FALSE, conditional=FALSE, data=NULL, latent=FALSE, ...)

## S3 method for class 'lvmfit'
logLik(object, p=coef(object),
        data=model.frame(object),
        model=object$estimator,
        weights=Weights(object),
        data2=object$data$data2,
        ...)

## S3 method for class 'lvmfit'
score(x, data=model.frame(x), p=pars(x), model=x$estimator,
       weights=Weights(x), data2=x$data$data2, ...)

## S3 method for class 'lvmfit'
information(x, p=pars(x), n=x$data$n, data=model.frame(x),
            model=x$estimator, weights=Weights(x), data2=x$data$data2, ...)

```

**Arguments**

object	Model object
...	Additional arguments to be passed to the low level functions
x	Model object
p	Parameter vector used to calculate statistics
data	Data.frame to use
latent	If TRUE predictions of latent variables are included in output
data2	Optional second data.frame (only for censored observations)
weights	Optional weight matrix
n	Number of observations
conditional	If TRUE the conditional moments given the covariates are calculated. Otherwise the joint moments are calculated
model	String defining estimator, e.g. "gaussian" (see estimate)
debug	Debugging only
chisq	Boolean indicating whether to calculate chi-squared goodness-of-fit (always TRUE for estimator='gaussian')

```

level           Level of confidence limits for RMSEA
rmsea.threshold Which probability to calculate, Pr(RMSEA<rmsea.threshold)
all             Calculate all (ad hoc) FIT indices: TLI, CFI, NFI, SRMR, ...

```

**Value**

A htest-object.

**Author(s)**

Klaus K. Holst

**Examples**

```

m <- lvm(list(y~v1+v2+v3+v4,c(v1,v2,v3,v4)~x))
set.seed(1)
dd <- sim(m,1000)
e <- estimate(m, dd)
gof(e,all=TRUE,rmsea.threshold=0.05,level=0.9)

set.seed(1)
m <- lvm(list(c(y1,y2,y3)~u,y1~x)); latent(m) <- ~u
regression(m,c(y2,y3)~u) <- "b"
d <- sim(m,1000)
e <- estimate(m,d)
rsq(e)
##
rr <- rsq(e,TRUE)
rr
estimate(rr,contrast=rbind(c(1,-1,0),c(1,0,-1),c(0,1,-1)))

```

**Graph***Extract graph***Description**

Extract or replace graph object

**Usage**

```

Graph(x, ...)
Graph(x, ...) <- value

```

**Arguments**

- |       |  |
|-------|--|
| x     | Model object   |

```

indoorenv

*Data*

**Description**

Description

**Format**

data.frame

**Source**

Simulated

intercept

*Fix mean parameters in 'lvm'-object*

**Description**

Define linear constraints on intercept parameters in a lvm-object.

**Usage**

```
## S3 replacement method for class 'lvm'
intercept(object, vars, ...) <- value
```

**Arguments**

object	lvm-object
...	Additional arguments
vars	character vector of variable names
value	Vector (or list) of parameter values or labels (numeric or character) or a formula defining the linear constraints (see also the <code>regression</code> or <code>covariance</code> methods).

**Details**

The `intercept` function is used to specify linear constraints on the intercept parameters of a latent variable model. As an example we look at the multivariate regression model

$$E(Y_1|X) = \alpha_1 + \beta_1 X$$

$$E(Y_2|X) = \alpha_2 + \beta_2 X$$

defined by the call

```
m <- lvm(c(y1,y2) ~ x)
```

To fix  $\alpha_1 = \alpha_2$  we call

```
intercept(m) <- c(y1,y2) ~ f(mu)
```

Fixed parameters can be reset by fixing them to NA. For instance to free the parameter restriction of  $Y_1$  and at the same time fixing  $\alpha_2 = 2$ , we call

```
intercept(m, ~y1+y2) <- list(NA, 2)
```

Calling `intercept` with no additional arguments will return the current intercept restrictions of the lvm-object.

**Value**

A lvm-object

**Note**

Variables will be added to the model if not already present.

**Author(s)**

Klaus K. Holst

**See Also**

`covariance<-`, `regression<-`, `constrain<-`, `parameter<-`, `latent<-`, `cancel<-`, `kill<-`

## Examples

```
## A multivariate model
m <- lvm(c(y1,y2) ~ f(x1,beta)+x2)
regression(m) <- y3 ~ f(x1,beta)
intercept(m) <- y1 ~ f(mu)
intercept(m, ~y2+y3) <- list(2,"mu")
intercept(m) ## Examine intercepts of model (NA translates to free/unique parameter##r)
```

ksmooth2

*Plot/estimate surface*

## Description

Plot/estimate surface

## Usage

```
ksmooth2(
  x,
  data,
  h = NULL,
  xlab = NULL,
  ylab = NULL,
  zlab = "",
  gridsize = rep(51L, 2),
  ...
)
```

## Arguments

x	formula or data
data	data.frame
h	bandwidth
xlab	X label
ylab	Y label
zlab	Z label
gridsize	grid size of kernel smoother
...	Additional arguments to graphics routine (persp3d or persp)

## Examples

```

}

```

labels&lt;-

*Define labels of graph*

## Description

Alters labels of nodes and edges in the graph of a latent variable model

## Usage

```

## Default S3 replacement method:
labels(object, ...) <- value
## S3 replacement method for class 'lvm'
edgelabels(object, to, ...) <- value
## Default S3 replacement method:
nodecolor(object, var=vars(object),
border, labcol, shape, lwd, ...) <- value

```

## Arguments

object	lvm-object.
...	Additional arguments (lwd, cex, col, labcol), border.
value	node label/edge label/color
to	Formula specifying outcomes and predictors defining relevant edges.

<code>var</code>	Formula or character vector specifying the nodes/variables to alter.
<code>border</code>	Colors of borders
<code>labcol</code>	Text label colors
<code>shape</code>	Shape of node
<code>lwd</code>	Line width of border

**Author(s)**

Klaus K. Holst

**Examples**

```
m <- lvm(c(y,v)~x+z)
regression(m) <- c(v,x)~z
labels(m) <- c(y=expression(psi), z=expression(zeta))
nodecolor(m,~y+z+x,border=c("white","white","black"),
          labcol="white", lwd=c(1,1,5),
          lty=c(1,2)) <- c("orange","indianred","lightgreen")
edgelabels(m,y~z+x, cex=c(2,1.5), col=c("orange","black"),labcol="darkblue",
           arrowhead=c("tee","dot"),
           lwd=c(3,1)) <- expression(phi,rho)
edgelabels(m,c(v,x)~z, labcol="red", cex=0.8,arrowhead="none") <- 2
if (interactive()) {
  plot(m,addstyle=FALSE)
}

m <- lvm(y~x)
labels(m) <- list(x="multiple\nlines")
if (interactive()) {
  op <- par(mfrow=c(1,2))
  plot(m,plain=TRUE)
  plot(m)
  par(op)

d <- sim(m,100)
e <- estimate(m,d)
plot(e,type="sd")
}
```

**Description**

Extract and set global parameters of `lava`. In particular optimization parameters for the `estimate` function.

**Usage**

```
lava.options(...)
```

**Arguments**

```
...          Arguments
```

**Details**

- **param:** 'relative' (factor loading and variance of one endogenous variables in each measurement model are fixed to one), 'absolute' (mean and variance of latent variables are set to 0 and 1, respectively), 'hybrid' (intercept of latent variables is fixed to 0, and factor loading of at least one endogenous variable in each measurement model is fixed to 1), 'none' (no constraints are added)
- **layout:** One of 'dot','fdp','circo','twopi','neato','osage'
- **messages:** Set to 0 to disable various output messages
- ...

see control parameter of the estimate function.

**Value**

list of parameters

**Author(s)**

Klaus K. Holst

**Examples**

```
## Not run:  
lava.options(iter.max=100, messages=0)  
  
## End(Not run)
```

---

lvm

*Initialize new latent variable model*

---

**Description**

Function that constructs a new latent variable model object

**Usage**

```
lvm(x = NULL, ..., latent = NULL, messages = lava.options()$messages)
```

## Arguments

<code>x</code>	Vector of variable names. Optional but gives control of the sequence of appearance of the variables. The argument can be given as a character vector or formula, e.g. <code>~y1+y2</code> is equivalent to <code>c("y1", "y2")</code> . Alternatively the argument can be a formula specifying a linear model.
<code>...</code>	Additional arguments to be passed to the low level functions
<code>latent</code>	(optional) Latent variables
<code>messages</code>	Controls what messages are printed (0: none)

## Value

Returns an object of class `lvm`.

## Author(s)

Klaus K. Holst

## See Also

[regression](#), [covariance](#), [intercept](#), ...

## Examples

```
m <- lvm() # Empty model
m1 <- lvm(y~x) # Simple linear regression
m2 <- lvm(~y1+y2) # Model with two independent variables (argument)
m3 <- lvm(list(c(y1,y2,y3)~u,u~x+z)) # SEM with three items
```

*makemissing*

*Create random missing data*

## Description

Generates missing entries in data.frame/matrix

## Usage

```
makemissing(
  data,
  p = 0.2,
  cols = seq_len(ncol(data)),
  rowwise = FALSE,
  nafun = function(x) x,
  seed = NULL
)
```

**Arguments**

data	data.frame
p	Fraction of missing data in each column
cols	Which columns (name or index) to alter
rowwise	Should missing occur row-wise (either none or all selected columns are missing)
nafun	(Optional) function to be applied on data.frame before return (e.g. na.omit to return complete-cases only)
seed	Random seed

**Value**

data.frame

**Author(s)**

Klaus K. Holst

measurement.error      *Two-stage (non-linear) measurement error***Description**

Two-stage measurement error

**Usage**

```
measurement.error(
  model1,
  formula,
  data = parent.frame(),
  predictfun = function(mu, var, data, ...) mu[, 1]^2 + var[1],
  id1,
  id2,
  ...
)
```

**Arguments**

model1	Stage 1 model
formula	Formula specifying observed covariates in stage 2 model
data	data.frame
predictfun	Predictions to be used in stage 2
id1	Optional id-vector of stage 1
id2	Optional id-vector of stage 2
...	Additional arguments to lower level functions

**See Also**

`stack.estimate`

**Examples**

```
m <- lvm(c(y1,y2,y3)~u,c(y3,y4,y5)~v,u~~v,c(u,v)~x)
transform(m,u2~u) <- function(x) x^2
transform(m,uv~u+v) <- prod
regression(m) <- z~u2+u+v+uv+x
set.seed(1)
d <- sim(m,1000,p=c("u,u"=1))

## Stage 1
m1 <- lvm(c(y1[0:s],y2[0:s],y3[0:s])~1*u,c(y3[0:s],y4[0:s],y5[0:s])~1*v,u~b*x,u~~v)
latent(m1) <- ~u+v
e1 <- estimate(m1,d)

pp <- function(mu,var,data,...) {
  cbind(u=mu[,"u"],u2=mu[,"u"]^2+var["u","u"],v=mu[,"v"],uv=mu[,"u"]*mu[,"v"]+var["u","v"])
}
e <- measurement.error(e1, z~1+x, data=d, predictfun=pp)

## uu <- seq(-1,1,length.out=100)
## pp <- estimate(e,function(p,...) p["(Intercept)"]+p["u"]*uu+p["u2"]*uu^2)$coefmat
if (interactive()) {
  plot(e,intercept=TRUE,line=0)

  f <- function(p) p[1]+p["u"]*u+p["u2"]*u^2
  u <- seq(-1,1,length.out=100)
  plot(e, f, data=data.frame(u), ylim=c(-.5,2.5))
}
```

Missing

*Missing value generator*

**Description**

Missing value generator

**Usage**

```
Missing(object, formula, Rformula, missing.name, suffix = "0", ...)
```

**Arguments**

`object`      lvm-object.

formula	The right hand side specifies the name of a latent variable which is not always observed. The left hand side specifies the name of a new variable which is equal to the latent variable but has missing values. If given as a string then this is used as the name of the latent (full-data) name, and the observed data name is 'missing.data'
Rformula	Missing data mechanism with left hand side specifying the name of the observed data indicator (may also just be given as a character instead of a formula)
missing.name	Name of observed data variable (only used if 'formula' was given as a character specifying the name of the full-data variable)
suffix	If missing.name is missing, then the name of the observed data variable will be the name of the full-data variable + the suffix
...	Passed to binomial.lvm.

## Details

This function adds a binary variable to a given lvm model and also a variable which is equal to the original variable where the binary variable is equal to zero

## Value

lvm object

## Author(s)

Thomas A. Gerds <tag@biostat.ku.dk>

## Examples

```

library(lava)
set.seed(17)
m <- lvm(y0~x01+x02+x03)
m <- Missing(m,formula=x1~x01,Rformula=R1~0.3*x02+-0.7*x01,p=0.4)

## m <- Missing(m,"y","r",missing.name="y .")

```

```
## same as
## m <- Missing(m,y.y,"r")
sim(m,10)
```

missingdata

*Missing data example***Description**

Simulated data generated from model

$$E(Y_i | X) = X, \quad cov(Y_1, Y_2 | X) = 0.5$$

**Format**

list of data.frames

**Details**

The list contains four data sets 1) Complete data 2) MCAR 3) MAR 4) MNAR (missing mechanism depends on variable V correlated with Y1,Y2)

**Source**

Simulated

**Examples**

```
data(missingdata)
e0 <- estimate(lvm(c(y1,y2)~b*x,y1~~y2),missingdata[[1]]) ## No missing
e1 <- estimate(lvm(c(y1,y2)~b*x,y1~~y2),missingdata[[2]]) ## CC (MCAR)
e2 <- estimate(lvm(c(y1,y2)~b*x,y1~~y2),missingdata[[2]],missing=TRUE) ## MCAR
e3 <- estimate(lvm(c(y1,y2)~b*x,y1~~y2),missingdata[[3]]) ## CC (MAR)
e4 <- estimate(lvm(c(y1,y2)~b*x,y1~~y2),missingdata[[3]],missing=TRUE) ## MAR
```

mixture

*Estimate mixture latent variable model.***Description**

Estimate mixture latent variable model

## Usage

```
mixture(
  x,
  data,
  k = length(x),
  control = list(),
  vcov = "observed",
  names = FALSE,
  ...
)
```

## Arguments

<b>x</b>	List of <code>lvm</code> objects. If only a single <code>lvm</code> object is given, then a k-mixture of this model is fitted (free parameters varying between mixture components).
<b>data</b>	<code>data.frame</code>
<b>k</b>	Number of mixture components
<b>control</b>	Optimization parameters (see details) #type Type of EM algorithm (standard, classification, stochastic)
<b>vcov</b>	of asymptotic covariance matrix (NULL to omit)
<b>names</b>	If TRUE returns the names of the parameters (for defining starting values)
<b>...</b>	Additional arguments parsed to lower-level functions

## Details

Estimate parameters in a mixture of latent variable models via the EM algorithm.

The performance of the EM algorithm can be tuned via the `control` argument, a list where a subset of the following members can be altered:

- start** Optional starting values
- nstart** Evaluate `nstart` different starting values and run the EM-algorithm on the parameters with largest likelihood
- tol** Convergence tolerance of the EM-algorithm. The algorithm is stopped when the absolute change in likelihood and parameter (2-norm) between successive iterations is less than `tol`
- iter.max** Maximum number of iterations of the EM-algorithm
- gamma** Scale-down (i.e. number between 0 and 1) of the step-size of the Newton-Raphson algorithm in the M-step
- trace** Trace information on the EM-algorithm is printed on every `traceth` iteration

Note that the algorithm can be aborted any time (C-c) and still be saved (via `on.exit` call).

m <- lvm(y~x)
e <- estimate(m, sim(m,100))
Model(e)
```

---

modelsearch*Model searching*

---

**Description**

Performs Wald or score tests

**Usage**

```
modelsearch(x, k = 1, dir = "forward", type = "all", ...)
```

**Arguments**

x	lvmfit-object
k	Number of parameters to test simultaneously. For equivalence the number of additional associations to be added instead of rel.
dir	Direction to do model search. "forward" := add associations/arrows to model/graph (score tests), "backward" := remove associations/arrows from model/graph (wald test)
type	If equal to 'correlation' only consider score tests for covariance parameters. If equal to 'regression' go through direct effects only (default 'all' is to do both)
...	Additional arguments to be passed to the low level functions

**Value**

Matrix of test-statistics and p-values

**Author(s)**

Klaus K. Holst

**See Also**

e <- estimate(m,dd);
modelsearch(e,messages=0)
modelsearch(e,messages=0,type="cor")
```

**multinomial**

*Estimate probabilities in contingency table*

**Description**

Estimate probabilities in contingency table

**Usage**

```
multinomial(
  x,
  data = parent.frame(),
  marginal = FALSE,
  transform,
  vcov = TRUE,
  iid = TRUE,
  ...
)
```

**Arguments**

<code>x</code>	Formula (or matrix or data.frame with observations, 1 or 2 columns)
<code>data</code>	Optional data.frame
<code>marginal</code>	If TRUE the marginals are estimated
<code>transform</code>	Optional transformation of parameters (e.g., logit)
<code>vcov</code>	Calculate asymptotic variance (default TRUE)
<code>iid</code>	Return iid decomposition (default TRUE)
<code>...</code>	Additional arguments to lower-level functions

**Author(s)**

Klaus K. Holst

## Examples

```

set.seed(1)
breaks <- c(-Inf,-1,0,Inf)
m <- lvm(); covariance(m,pairwise=TRUE) <- ~y1+y2+y3+y4

## End(Not run)

##partial gamma
d2$x <- rbinom(nrow(d2),2,0.5)
gkgamma(z1~z2|x,data=d2)

```

## Description

Estimate mixture latent variable model

**Usage**

```
mvnmix(
  data,
  k = 2,
  theta,
  steps = 500,
  tol = 1e-16,
  lambda = 0,
  mu = NULL,
  silent = TRUE,
  extra = FALSE,
  n.start = 1,
  init = "kmpp",
  ...
)
```

**Arguments**

<code>data</code>	<code>data.frame</code>
<code>k</code>	Number of mixture components
<code>theta</code>	Optional starting values
<code>steps</code>	Maximum number of iterations
<code>tol</code>	Convergence tolerance of EM algorithm
<code>lambda</code>	Regularisation parameter. Added to diagonal of covariance matrix (to avoid singularities)
<code>mu</code>	Initial centres (if unspecified random centres will be chosen)
<code>silent</code>	Turn on/off output messages
<code>extra</code>	Extra debug information
<code>n.start</code>	Number of restarts
<code>init</code>	Function to choose initial centres
<code>...</code>	Additional arguments parsed to lower-level functions

**Details**

Estimate parameters in a mixture of latent variable models via the EM algorithm.

**Value**

A `mixture` object

**Author(s)**

Klaus K. Holst

**See Also**

`mixture`

**Examples**

```
data(faithful)
set.seed(1)
M1 <- mvnmix(faithful[, "waiting", drop=FALSE], k=2)
M2 <- mvnmix(faithful, k=2)
if (interactive()) {
  par(mfrow=c(2,1))
  plot(M1, col=c("orange", "blue"), ylim=c(0, 0.05))
  plot(M2, col=c("orange", "blue"))
}
```

NA2x

*Convert to/from NA*

**Description**

Convert vector to/from NA

**Usage**

```
NA2x(s, x = 0)
```

**Arguments**

- |                |  |
|----------------|--|
| <code>s</code> | The input vector (of arbitrary class)                              |
| <code>x</code> | The elements to transform into NA resp. what to transform NA into. |

**Value**

A vector with same dimension and class as `s`.

**Author(s)**

Klaus K. Holst

**Examples**

```
##'
x2NA(1:10, 1:5)
NA2x(x2NA(c(1:10), 5), 5)##'
```

---

nldata	<i>Example data (nonlinear model)</i>
--------	---------------------------------------

---

**Description**

Example data (nonlinear model)

**Format**

data.frame

**Source**

Simulated

---

NR	<i>Newton-Raphson method</i>
----	------------------------------

---

**Description**

Newton-Raphson method

**Usage**

```
NR(
  start,
  objective = NULL,
  gradient = NULL,
  hessian = NULL,
  control,
  args = NULL,
  ...
)
```

**Arguments**

start	Starting value
objective	Optional objective function (used for selecting step length)
gradient	gradient
hessian	hessian (if NULL a numerical derivative is used)
control	optimization arguments (see details)
args	Optional list of arguments parsed to objective, gradient and hessian
...	additional arguments parsed to lower level functions

## Details

`control` should be a list with one or more of the following components:

- `trace`: integer for which output is printed each 'trace'th iteration
- `iter`: max number of iterations
- `stepsize`: Step size (default 1)
- `nstepsize`: Increase stepsize every `nstepsize` iteration (from `stepsize` to 1)
- `tol`: Convergence criterion (gradient)
- `epsilon`: threshold used in pseudo-inverse
- `backtrack`: In each iteration reduce stepsize unless solution is improved according to criterion (gradient, armijo, curvature, wolfe)

## Examples

```
# Objective function with gradient and hessian as attributes
f <- function(z) {
  x <- z[1]; y <- z[2]
  val <- x^2 + x*y^2 + x + y
  structure(val, gradient=c(2*x+y^2+1, 2*y*x+1),
            hessian=rbind(c(2,2*y),c(2*y,2*x)))
}
NR(c(0,0),f)

# Parsing arguments to the function and
g <- function(x,y) (x*y+1)^2
NR(0, gradient=g, args=list(y=2), control=list(trace=1,tol=1e-20))
```

ordinal<- *Define variables as ordinal*

### Description

Define variables as ordinal in latent variable model object

### Usage

```
ordinal(x, ...) <- value
```

### Arguments

x	Object
...	additional arguments to lower level functions
value	variable (formula or character vector)

### Examples

```
if (requireNamespace("mets")) {
  m <- lvm(y + z ~ x + 1*u[0], latent=~u)
  ordinal(m, K=3) <- ~y+z
  d <- sim(m, 100, seed=1)
  e <- estimate(m, d)
}
```

ordreg *Univariate cumulative link regression models*

### Description

Ordinal regression models

### Usage

```
ordreg(
  formula,
  data = parent.frame(),
  offset,
  family = stats::binomial("probit"),
  start,
  fast = FALSE,
  ...
)
```

**Arguments**

formula	formula
data	data.frame
offset	offset
family	family (default proportional odds)
start	optional starting values
fast	If TRUE standard errors etc. will not be calculated
...	Additional arguments to lower level functions

**Author(s)**

Klaus K. Holst

**Examples**

```
m <- lvm(y~x)
ordinal(m,K=3) <- ~y
d <- sim(m,100)
e <- ordreg(y~x,d)
```

---

parpos

*Generic method for finding indeces of model parameters*

---

**Description**

Generic method for finding indeces of model parameters

**Usage**

```
parpos(x, ...)
```

**Arguments**

x	Model object
...	Additional arguments

**Author(s)**

Klaus K. Holst

---

partialcor	<i>Calculate partial correlations</i>
------------	---------------------------------------

---

## Description

Calculate partial correlation coefficients and confidence limits via Fishers z-transform

## Usage

```
partialcor(formula, data, level = 0.95, ...)
```

## Arguments

formula	formula specifying the covariates and optionally the outcomes to calculate partial correlation for
data	data.frame
level	Level of confidence limits
...	Additional arguments to lower level functions

## Value

A coefficient matrix

## Author(s)

Klaus K. Holst

## Examples

```
m <- lvm(c(y1,y2,y3)~x1+x2)
covariance(m) <- c(y1,y2,y3)~y1+y2+y3
d <- sim(m,500)
partialcor(~x1+x2,d)
```

---

path	<i>Extract pathways in model graph</i>
------	--

---

### Description

Extract all possible paths from one variable to another connected component in a latent variable model. In an estimated model the effect size is decomposed into direct, indirect and total effects including approximate standard errors.

### Usage

```
## S3 method for class 'lvm'
path(object, to = NULL, from, all=FALSE, ...)
## S3 method for class 'lvmfit'
effects(object, to, from, ...)
```

### Arguments

object	Model object (lvm)
...	Additional arguments to be passed to the low level functions
to	Outcome variable (string). Alternatively a formula specifying response and predictor in which case the argument <code>from</code> is ignored.
from	Response variable (string), not necessarily directly affected by <code>to</code> .
all	If TRUE all simple paths (in undirected graph) is returned on/off.

### Value

If `object` is of class `lvmfit` a list with the following elements is returned

idx	A list where each element defines a possible pathway via a integer vector indicating the index of the visited nodes.
V	A List of covariance matrices for each path.
coef	A list of parameters estimates for each path
path	A list where each element defines a possible pathway via a character vector naming the visited nodes in order.
edges	Description of 'comp2'

If `object` is of class `lvm` only the `path` element will be returned.

The `effects` method returns an object of class `effects`.

### Note

For a `lvmfit`-object the parameters estimates and their corresponding covariance matrix are also returned. The `effects`-function additionally calculates the total and indirect effects with approximate standard errors

path(m,y1~x1,all=TRUE)
```

**pcor**

*Polychoric correlation*

**Description**

Maximum likelihood estimates of polychoric correlations

**Usage**

```
pcor(x, y, X, start, ...)
```

**Arguments**

<code>x</code>	Variable 1
<code>y</code>	Variable 2
<code>X</code>	Optional covariates
<code>start</code>	Optional starting values
<code>...</code>	Additional arguments to lower level functions

---

PD

*Dose response calculation for binomial regression models*

---

## Description

Dose response calculation for binomial regression models

## Usage

```
PD(  
  model,  
  intercept = 1,  
  slope = 2,  
  prob = NULL,  
  x,  
  level = 0.5,  
  ci.level = 0.95,  
  vcov,  
  family,  
  EB = NULL  
)
```

## Arguments

model	Model object or vector of parameter estimates
intercept	Index of intercept parameters
slope	Index of intercept parameters
prob	Index of mixture parameters (only relevant for zibreg models)
x	Optional weights length(x)=length(intercept)+length(slope)+length(prob)
level	Probability at which level to calculate dose
ci.level	Level of confidence limits
vcov	Optional estimate of variance matrix of parameter estimates
family	Optional distributional family argument
EB	Optional ratio of treatment effect and adverse effects used to find optimal dose (regret-function argument)

**pdfconvert***Convert pdf to raster format*

---

**Description**

Convert PDF file to print quality png (default 300 dpi)

**Usage**

```
pdfconvert(  
  files,  
  dpi = 300,  
  resolution = 1024,  
  gs,  
  gsopt,  
  resize,  
  format = "png",  
  ...  
)
```

**Arguments**

files	Vector of (pdf-)filenames to process
dpi	DPI
resolution	Resolution of raster image file
gs	Optional ghostscript command
gsopt	Optional ghostscript arguments
resize	Optional resize arguments (mogrify)
format	Raster format (e.g. png, jpg, tif, ...)
...	Additional arguments

**Details**

Access to ghostscript program 'gs' is needed

plot.estimate      *Plot method for 'estimate' objects*

---

## Description

Plot method for 'estimate' objects

## Usage

```
## S3 method for class 'estimate'  
plot(  
  x,  
  f,  
  idx,  
  intercept = FALSE,  
  data,  
  confint = TRUE,  
  type = "l",  
  xlab = "x",  
  ylab = "f(x)",  
  col = 1,  
  add = FALSE,  
  ...  
)
```

## Arguments

x	estimate object
f	function of parameter coefficients and data parsed on to 'estimate'. If omitted a forest-plot will be produced.
idx	Index of parameters (default all)
intercept	include intercept in forest-plot
data	data.frame
confint	Add confidence limits
type	plot type ('l')
xlab	x-axis label
ylab	y-axis label
col	color
add	add plot to current device
...	additional arguments to lower-level functions

---

`plot.lvm`*Plot path diagram*

---

## Description

Plot the path diagram of a SEM

## Usage

```
## S3 method for class 'lvm'
plot(
  x,
  diag = FALSE,
  cor = TRUE,
  labels = FALSE,
  intercept = FALSE,
  addcolor = TRUE,
  plain = FALSE,
  cex,
  fontsize1 = 10,
  noplay = FALSE,
  graph = list(rankdir = "BT"),
  attrs = list(graph = graph),
  unexpr = FALSE,
  addstyle = TRUE,
  plot.engine = lava.options()$plot.engine,
  init = TRUE,
  layout = lava.options()$layout,
  edgecolor = lava.options()$edgecolor,
  graph.proc = lava.options()$graph.proc,
  ...
)
```

## Arguments

<code>x</code>	Model object
<code>diag</code>	Logical argument indicating whether to visualize variance parameters (i.e. diagonal of variance matrix)
<code>cor</code>	Logical argument indicating whether to visualize correlation parameters
<code>labels</code>	Logical argument indicating whether to add labels to plot (Unnamed parameters will be labeled p1,p2,...)
<code>intercept</code>	Logical argument indicating whether to add intercept labels
<code>addcolor</code>	Logical argument indicating whether to add colors to plot (overrides nodecolor calls)
<code>plain</code>	if TRUE strip plot of colors and boxes

cex	Fontsize of node labels
fontsize1	Fontsize of edge labels
noplot	if TRUE then return graphNEL object only
graph	Graph attributes (Rgraphviz)
attrs	Attributes (Rgraphviz)
unexpr	if TRUE remove expressions from labels
addstyle	Logical argument indicating whether additional style should automatically be added to the plot (e.g. dashed lines to double-headed arrows)
plot.engine	default 'Rgraphviz' if available, otherwise visNetwork,igraph
init	Reinitialize graph (for internal use)
layout	Graph layout (see Rgraphviz or igraph manual)
edgecolor	if TRUE plot style with colored edges
graph.proc	Function that post-process the graph object (default: subscripts are automatically added to labels of the nodes)
...	Additional arguments to be passed to the low level functions

## Author(s)

```

## Arguments

x	sim object
estimate	columns with estimates
se	columns with standard error estimates
true	(optional) vector of true parameter values
names	(optional) names of estimates
auto.layout	Auto layout (default TRUE)
byrow	Add new plots to layout by row
type	plot type
ask	if TRUE user is asked for input, before a new figure is drawn
col	colour (for each estimate)
pch	plot symbol
cex	point size
lty	line type
lwd	line width
legend	legend
legendpos	legend position
cex.legend	size of legend text
plot.type	'single' or 'multiple' (default)
polygon	if TRUE fill the density estimates with colour
density	if non-zero add shading lines to polygon
angle	shading lines angle of polygon
cex.axis	Font size on axis
alpha	Semi-transparent level (1: non-transparent, 0: full)
main	Main title

cex.main	Size of title font
equal	Same x-axis and y-axis for all plots
delta	Controls the amount of space around axis limits
ylim	y-axis limits
xlim	x-axis limits
ylab	y axis label
xlab	x axis label
rug	if TRUE add rug representation of data to x-axis
rug.alpha	rug semi-transparency level
line.col	line colour (running mean, only for scatter plots)
line.lwd	line width (running mean, only for scatter plots)
line.lty	line type (running mean, only for scatter plots)
line.alpha	line transparency
scatter.ylab	y label for density plots
scatter.ylim	y-axis limits for density plots
scatter.xlim	x-axis limits for density plots
scatter.alpha	semi-transparency of scatter plot
scatter.col	scatter plot colour
border	border colour of density estimates
true.lty	true parameter estimate line type
true.col	true parameter colour
true.lwd	true parameter line width
density.plot	if TRUE add density plot
scatter.plot	if TRUE add scatter plot
running.mean	if TRUE add running average estimate to scatter plot
...	additional arguments to lower level functions

## Examples

**plotConf***Plot regression lines*

---

**Description**

Plot regression line (with interactions) and partial residuals.

**Usage**

```
plotConf(  
  model,  
  var1 = NULL,  
  var2 = NULL,  
  data = NULL,  
  ci.lty = 0,  
  ci = TRUE,  
  level = 0.95,  
  pch = 16,  
  lty = 1,  
  lwd = 2,  
  npoints = 100,  
  xlim,  
  col = NULL,  
  colpt,  
  alpha = 0.5,  
  cex = 1,  
  delta = 0.07,  
  centermark = 0.03,  
  jitter = 0.2,  
  cidiff = FALSE,  
  mean = TRUE,  
  legend = ifelse(is.null(var1), FALSE, "topright"),

  partse = FALSE,  
  labels,  
  vcov,  
  predictfun,  
  plot = TRUE,  
  new = TRUE,  
  ...  
)
```

**Arguments**

model	Model object (e.g. lm)
var1	predictor (Continuous or factor)

var2	Factor that interacts with var1
data	data.frame to use for prediction (model.frame is used as default)
ci.lty	Line type for confidence limits
ci	Boolean indicating whether to draw pointwise 95% confidence limits
level	Level of confidence limits (default 95%)
pch	Point type for partial residuals
lty	Line type for estimated regression lines
lwd	Line width for regression lines
npoints	Number of points used to plot curves
xlim	Range of x axis
col	Color (for each level in var2)
colpt	Color of partial residual points
alpha	Alpha level
cex	Point size
delta	For categorical var1
centermark	For categorical var1
jitter	For categorical var1
cidiff	For categorical var1
mean	For categorical var1
legend	Boolean (add legend)
trans	Transform estimates (e.g. exponential)
partres	Boolean indicating whether to plot partial residuals
partse	.
labels	Optional labels of var2
vcov	Optional variance estimates
predictfun	Optional predict-function used to calculate confidence limits and predictions
plot	If FALSE return only predictions and confidence bands
new	If FALSE add to current plot
...	additional arguments to lower level functions

### Value

list with following members:

x	Variable on the x-axis (var1)
y	Variable on the y-axis (partial residuals)
predict	Matrix with confidence limits and predicted values

y1[1:5] <- NA; yr[6:10] <- NA  
S1 <- survival::Surv(y1, yr, type="interval2")  
S2 <- survival::Surv(y, y>0, type="right")  
S3 <- survival::Surv(y, y<0, type="left")  
  
rbind(S1, S1)  
rbind(S2, S2)  
rbind(S3, S3)
```

---

regression<-

*Add regression association to latent variable model*

---

## Description

Define regression association between variables in a lvm-object and define linear constraints between model equations.

## Usage

```
## S3 method for class 'lvm'
regression(object = lvm(), to, from, fn = NA,
messages = lava.options()$messages, additive=TRUE, y, x, value, ...)
## S3 replacement method for class 'lvm'
regression(object, to=NULL, quick=FALSE, ...) <- value
```

## Arguments

object	lvm-object.
...	Additional arguments to be passed to the low level functions
value	A formula specifying the linear constraints or if to=NULL a list of parameter values.
to	Character vector of outcome(s) or formula object.
from	Character vector of predictor(s).
fn	Real function defining the functional form of predictors (for simulation only).
messages	Controls which messages are turned on/off (0: all off)
additive	If FALSE and predictor is categorical a non-additive effect is assumed
y	Alias for 'to'
x	Alias for 'from'
quick	Faster implementation without parameter constraints

## Details

The regression function is used to specify linear associations between variables of a latent variable model, and offers formula syntax resembling the model specification of e.g. lm.

For instance, to add the following linear regression model, to the lvm-object, m:

$$E(Y|X_1, X_2) = \beta_1 X_1 + \beta_2 X_2$$

We can write

```
regression(m) <- y ~ x1 + x2
```

Multivariate models can be specified by successive calls with regression, but multivariate formulas are also supported, e.g.

```
regression(m) <-c(y1,y2) ~ x1 + x2
```

defines

$$E(Y_i|X_1, X_2) = \beta_{1i}X_1 + \beta_{2i}X_2$$

The special function, `f`, can be used in the model specification to specify linear constraints. E.g. to fix  $\beta_1 = \beta_2$ , we could write

```
regression(m) <-y ~ f(x1,beta) + f(x2,beta)
```

The second argument of `f` can also be a number (e.g. defining an offset) or be set to NA in order to clear any previously defined linear constraints.

Alternatively, a more straight forward notation can be used:

```
regression(m) <-y ~ beta*x1 + beta*x2
```

All the parameter values of the linear constraints can be given as the right handside expression of the assignment function `regression<-` (or `regfix<-`) if the first (and possibly second) argument is defined as well. E.g:

```
regression(m,y1~x1+x2) <-list("a1","b1")
```

defines  $E(Y_i|X_1, X_2) = a1X_1 + b1X_2$ . The rhs argument can be a mixture of character and numeric values (and NA's to remove constraints).

The function `regression` (called without additional arguments) can be used to inspect the linear constraints of a `lvm`-object.

For backward compatibility the "\$"-symbol can be used to fix parameters at a given value. E.g. to add a linear relationship between `y` and `x` with slope 2 to the model `m`, we can write `regression(m, "y") <-"x$2"`. Similarly we can use the "@"-symbol to name parameters. E.g. in a multiple regression we can force the parameters to be equal: `regression(m, "y") <-c("x1@b", "x2@b")`. Fixed parameters can be reset by fixing (with `\$`) them to NA.

## Value

A `lvm`-object

## Note

Variables will be added to the model if not already present.

## Examples

```
m <- lvm() ## Initialize empty lvm-object
#### E(y1|z,v) = beta1*z + beta2*v
regression(m) <- y1 ~ z + v
#### E(y2|x,z,v) = beta*x + beta*z + 2*v + beta3*u
regression(m) <- y2 ~ f(x,beta) + f(z,beta) + f(v,2) + u
#### Clear restriction on association between y and
#### fix slope coefficient of u to beta
regression(m, y2 ~ v+u) <- list(NA, "beta")

regression(m) ## Examine current linear parameter constraints

## ## A multivariate model, E(yi|x1,x2) = beta[1i]*x1 + beta[2i]*x2:
m2 <- lvm(c(y1,y2) ~ x1+x2)
```

**revdiag**

*Create/extract 'reverse'-diagonal matrix or off-diagonal elements*

## Description

Create/extract 'reverse'-diagonal matrix or off-diagonal elements

## Usage

```
revdiag(x,...)
offdiag(x,type=0,...)

revdiag(x,...) <- value
offdiag(x,type=0,...) <- value
```

## Arguments

x	vector
...	additional arguments to lower level functions
value	For the assignment function the values to put in the diagonal
type	0: upper and lower triangular, 1: upper triangular, 2: lower triangular, 3: upper triangular + diagonal, 4: lower triangular + diagonal

## Author(s)

**rmvar***Remove variables from (model) object.***Description**

Generic method for removing elements of object

**Usage**

```
rmvar(x, ...) <- value
```

**Arguments**

<code>x</code>	Model object
<code>...</code>	additional arguments to lower level functions
<code>value</code>	Vector of variables or formula specifying which nodes to remove

**Author(s)**

Klaus K. Holst

**See Also**

`cancel`

**Examples**

```
m <- lvm()
addvar(m) <- ~y1+y2+x
covariance(m) <- y1~y2
regression(m) <- c(y1,y2) ~ x
### Cancel the covariance between the residuals of y1 and y2
cancel(m) <- y1~y2
### Remove y2 from the model
rmvar(m) <- ~y2
```

---

rotate2	<i>Performs a rotation in the plane</i>
---------	---

---

**Description**

Performs a rotation in the plane

**Usage**

```
rotate2(x, theta = pi)
```

**Arguments**

x	Matrix to be rotated (2 times n)
theta	Rotation in radians

**Value**

Returns a matrix of the same dimension as x

**Author(s)**

Klaus K. Holst

**Examples**

```
rotate2(cbind(c(1,2),c(2,1)))
```

---

scheffe	<i>Calculate simultaneous confidence limits by Scheffe's method</i>
---------	---

---

**Description**

Function to compute the Scheffe corrected confidence interval for the regression line

**Usage**

```
scheffe(model, newdata = model.frame(model), level = 0.95)
```

**Arguments**

model	Linear model
newdata	new data frame
level	confidence level (0.95)

## Examples

```

x <- rnorm(100)

semdata

*Example SEM data*

## Description

Simulated data

## Format

data.frame

## Source

Simulated

serotonin

*Serotonin data*

## Description

This simulated data mimics a PET imaging study where the 5-HT2A receptor and serotonin transporter (SERT) binding potential has been quantified into 8 different regions. The 5-HT2A cortical regions are considered high-binding regions measurements. These measurements can be regarded as proxy measures of the extra-cellular levels of serotonin in the brain

day	numeric	Scan day of the year
age	numeric	Age at baseline scan
mem	numeric	Memory performance score
depr	numeric	Depression (mild) status 500 days after baseline
gene1	numeric	Gene marker 1 (HTR2A)
gene2	numeric	Gene marker 2 (HTTLPR)
cau	numeric	SERT binding, Caudate Nucleus

th	numeric	SERT binding, Thalamus
put	numeric	SERT binding, Putamen
mid	numeric	SERT binding, Midbrain
aci	numeric	5-HT2A binding, Anterior cingulate gyrus
pci	numeric	5-HT2A binding, Posterior cingulate gyrus
sfc	numeric	5-HT2A binding, Superior frontal cortex
par	numeric	5-HT2A binding, Parietal cortex

sim	<i>Simulate model</i>
-----	-----------------------

---

### Description

Simulate data from a general SEM model including non-linear effects and general link and distribution of variables.

### Usage

```
## S3 method for class 'lvm'
sim(x, n = NULL, p = NULL, normal = FALSE, cond = FALSE,
sigma = 1, rho = 0.5, X = NULL, unlink=FALSE, latent=TRUE,
use.labels = TRUE, seed=NULL, ...)
```

### Arguments

x	Model object
...	Additional arguments to be passed to the low level functions
n	Number of simulated values/individuals
p	Parameter value (optional)
normal	Logical indicating whether to simulate data from a multivariate normal distribution conditional on exogenous variables hence ignoring functional/distribution definition
cond	for internal use
sigma	Default residual variance (1)
rho	Default covariance parameter (0.5)
X	Optional matrix of fixed values of variables (manipulation)
unlink	Return Inverse link transformed data
latent	Include latent variables (default TRUE)
use.labels	convert categorical variables to factors before applying transformation
seed	Random seed

### Author(s)

Klaus K. Holst

### Examples

```
#####
## Logistic regression
#####
m <- lvm(y~x+z)
regression(m) <- x~z
```

```

distribution(m,~y+z) <- binomial.lvm("logit")
d <- sim(m,1e3)
head(d)
e <- estimate(m,d,estimator="glm")
e
## Simulate a few observation from estimated model
sim(e,n=5)
#####
## Poisson
#####

**sim.default***Wrapper function for mclapply***Description**

Wrapper function for mclapply

**Usage**

```

## Default S3 method:
sim(
  x = NULL,
  R = 100,
  f = NULL,

```

```

colnames = NULL,
messages = lava.options()$messages,
mc.cores,
blocksize = 2L * mc.cores,
cl,
type = 1L,
seed = NULL,
args = list(),
iter = FALSE,
...
)

```

## Arguments

x	function or 'sim' object
R	Number of replications or data.frame with parameters
f	Optional function (i.e., if x is a matrix)
colnames	Optional column names
messages	Messages
mc.cores	Number of cores to use
blocksize	Split computations in blocks
cl	(optional) cluster to use for parallelization
type	type=0 is an alias for messages=1,mc.cores=1,blocksize=R
seed	(optional) Seed (needed with cl=TRUE)
args	(optional) list of named arguments passed to (mc)mapply
iter	If TRUE the iteration number is passed as first argument to (mc)mapply
...	Additional arguments to (mc)mapply

trend.lwd = 3,  
trend.jitter = 0,  
legend = NULL,  
by = NULL,  
xlab = "Time",  
ylab = "",  
add = FALSE,  
...  
)
```

### Arguments

formula	Formula (response ~ time)
data	data.frame
id	Id variable
group	group variable
type	Type (line 'l', stair 's', ...)
lty	Line type
pch	Colour
col	Colour
alpha	transparency (0-1)
lwd	Line width
level	Confidence level
trend.formula	Formula for trendline
tau	Quantile to estimate (trend)
trend.lty	Trend line type
trend.join	Trend polygon
trend.delta	Length of limit bars
trend	Add trend line
trend.col	Colour of trend line
trend.alpha	Transparency
trend.lwd	Trend line width
trend.jitter	Jitter amount

legend	Legend
by	make separate plot for each level in 'by' (formula, name of column, or vector)
xlab	Label of X-axis
ylab	Label of Y-axis
add	Add to existing device
...	Additional arguments to lower level arguments

**Author(s)**

Klaus K. Holst

**Examples**

```
if (interactive() & requireNamespace("mets")) {
  K <- 5
  y <- "y" %++% seq(K)
  m <- lvm()

  spaghetti(y~num, dd, id="id", lty=1, col=Col(1,.4),
             trend.formula=~num+I(num^2), trend=TRUE, trend.col="darkblue")
}
```

stack.estimate      *Stack estimating equations***Description**

Stack estimating equations (two-stage estimator)

**Usage**

```
## S3 method for class 'estimate'
stack(
  x,
  model2,
  D1u,
  inv.D2u,
```

```

propensity,
dpropensity,
U,
keep1 = FALSE,
propensity.arg,
estimate.arg,
na.action = na.pass,
...
)

```

### Arguments

x	Model 1
model2	Model 2
D1u	Derivative of score of model 2 w.r.t. parameter vector of model 1
inv.D2u	Inverse of deri
propensity	propensity score (vector or function)
dpropensity	derivative of propensity score wrt parameters of model 1
U	Optional score function (model 2) as function of all parameters
keep1	If FALSE only parameters of model 2 is returned
propensity.arg	Arguments to propensity function
estimate.arg	Arguments to 'estimate'
na.action	Method for dealing with missing data in propensity score
...	Additional arguments to lower level functions

### Examples

```

m <- lvm(z0~x)
Missing(m, z ~ z0) <- r~x
distribution(m, ~x) <- binomial.lvm()
p <- c(r=-1, 'r~x'=0.5, 'z0~x'=2)
beta <- p[3]/2
d <- sim(m, 500, p=p)
m1 <- estimate(r~x, data=d, family=binomial)
d$w <- d$r/predict(m1, type="response")
m2 <- estimate(z~1, weights=w, data=d)
(e <- stack(m1, m2, propensity=TRUE))

```

### Description

For internal use

### Author(s)

Klaus K. Holst

---

subset.lvm	<i>Extract subset of latent variable model</i>
------------	--

---

### Description

Extract measurement models or user-specified subset of model

### Usage

```
## S3 method for class 'lvm'
subset(x, vars, ...)
```

### Arguments

x	lvm-object.
vars	Character vector or formula specifying variables to include in subset.
...	Additional arguments to be passed to the low level functions

### Value

A lvm-object.

### Author(s)

Klaus K. Holst

### Examples

```
m <- lvm(c(y1,y2)~x1+x2)
subset(m, ~y1+x1)
```

---

summary.sim	<i>Summary method for 'sim' objects</i>
-------------	---

---

### Description

Summary method for 'sim' objects

**Usage**

```
## S3 method for class 'sim'
summary(
  object,
  estimate = NULL,
  se = NULL,
  confint = !is.null(se) && !is.null(true),
  true = NULL,
  fun,
  names = NULL,
  unique.names = TRUE,
  minimal = FALSE,
  level = 0.95,
  quantiles = c(0, 0.025, 0.5, 0.975, 1),
  ...
)
```

**Arguments**

object	sim object
estimate	(optional) columns with estimates
se	(optional) columns with standard error estimates
confint	(optional) list of pairs of columns with confidence limits
true	(optional) vector of true parameter values
fun	(optional) summary function
names	(optional) names of
unique.names	if TRUE, unique.names will be applied to column names
minimal	if TRUE, minimal summary will be returned
level	confidence level
quantiles	quantiles
...	additional levels to lower-level functions

**Description**

Add time-varying covariate effects to model

**Usage**

```
timedep(object, formula, rate, timecut, type = "coxExponential.lvm", ...)
```

**Arguments**

object	Model
formula	Formula with rhs specifying time-varying covariates
rate	Optional rate parameters. If given as a vector this parameter is interpreted as the raw (baseline-)rates within each time interval defined by <i>timecut</i> . If given as a matrix the parameters are interpreted as log-rates (and log-rate-ratios for the time-varying covariates defined in the formula).
timecut	Time intervals
type	Type of model (default piecewise constant intensity)
...	Additional arguments to lower level functions

**Author(s)**

Klaus K. Holst

**Examples**

```

## Piecewise constant hazard

## End(Not run)
```

**toformula***Converts strings to formula***Description**

Converts a vector of predictors and a vector of responses (characters) into a formula expression.

**Usage**

```
toformula(y = ".", x = ".")
```

**Arguments**

y	vector of predictors
x	vector of responses

**Value**

An object of class **formula**

**Author(s)**

Klaus K. Holst

**See Also**

[as.formula](#),

**Examples**

```
toformula(c("age","gender"), "weight")
```

<code>tr</code>	<i>Trace operator</i>
-----------------	-----------------------

**Description**

Calculates the trace of a square matrix.

**Usage**

```
tr(x, ...)
```

**Arguments**

<code>x</code>	Square numeric matrix
<code>...</code>	Additional arguments to lower level functions

**Value**

numeric

**Author(s)**

Klaus K. Holst

**See Also**

[crossprod](#), [tcrossprod](#)

**Examples**

```
tr(diag(1:5))
```

<code>trim</code>	<i>Trim string of (leading/trailing/all) white spaces</i>
-------------------	---

**Description**

Trim string of (leading/trailing/all) white spaces

**Usage**

```
trim(x, all = FALSE, ...)
```

**Arguments**

x	String
all	Trim all whitespaces?
...	additional arguments to lower level functions

**Author(s)**

Klaus K. Holst

---

twindata*Twin menarche data*

---

**Description**

Simulated data

id	numeric	Twin-pair id
zyg	character	Zygosity (MZ or DZ)
twinnum	numeric	Twin number (1 or 2)
agemena	numeric	Age at menarche (or censoring)
status	logical	Censoring status (observed:=T,censored:=F)
bw	numeric	Birth weight
msmoke	numeric	Did mother smoke? (yes:=1,no:=0)

**twostage.lvmfit**      *Two-stage estimator (non-linear SEM)*

**Description**

Two-stage estimator for non-linear structural equation models

**Usage**

```
## S3 method for class 'lvmfit'
twostage(
  object,
  model2,
  data = NULL,
  predict.fun = NULL,
  id1 = NULL,
  id2 = NULL,
  all = FALSE,
  formula = NULL,
  std.err = TRUE,
  ...
)
```

**Arguments**

<code>object</code>	Stage 1 measurement model
<code>model2</code>	Stage 2 SEM
<code>data</code>	<code>data.frame</code>
<code>predict.fun</code>	Prediction of latent variable
<code>id1</code>	Optional id-variable (stage 1 model)
<code>id2</code>	Optional id-variable (stage 2 model)
<code>all</code>	If TRUE return additional output (naive estimates)
<code>formula</code>	optional formula specifying non-linear relation
<code>std.err</code>	If FALSE calculations of standard errors will be skipped
<code>...</code>	Additional arguments to lower level functions

## Examples

```

m <- lvm(c(x1,x2,x3)~f1,f1~z,
          c(y1,y2,y3)~f2,f2~f1+z)
latent(m) <- ~f1+f2
d <- simulate(m,100,p=c("f2,f2"=2,"f1,f1"=0.5),seed=1)

## Full MLE
ee <- estimate(m,d)

## Manual two-stage
## Not run:
m1 <- lvm(c(x1,x2,x3)~f1,f1~z); latent(m1) <- ~f1

a

## End(Not run)

```

twostageCV

*Cross-validated two-stage estimator*

## Description

Cross-validated two-stage estimator for non-linear SEM

## Usage

```

twostageCV(
  model1,
  model2,
  data,
  control1 = list(trace = 0),

```

```

control2 = list(trace = 0),
knots.boundary,
mc.cores = 1,
nmix = 1:4,
df = 1:9,
fix = TRUE,
std.err = TRUE,
nfolds = 5,
rep = 1,
messages = 0,
...
)

```

### Arguments

model1	model 1 (exposure measurement error model)
model2	model 2
data	data.frame
control1	optimization parameters for model 1
control2	optimization parameters for model 1
knots.boundary	boundary points for natural cubic spline basis
mc.cores	number of cores to use for parallel computations
nmix	number of mixture components
df	spline degrees of freedom
fix	automatically fix parameters for identification (TRUE)
std.err	calculation of standard errors (TRUE)
nfolds	Number of folds (cross-validation)
rep	Number of repeats of cross-validation
messages	print information (>0)
...	additional arguments to lower level functions

### Examples

```

## Reduce Ex.Timings
m1 <- lvm( x1+x2+x3 ~ u1, latent= ~u1)
m2 <- lvm( y ~ 1 )
m <- functional(merge(m1,m2), y ~ u, value=function(x) sin(x)+x)
distribution(m, ~u1) <- uniform.lvm(-6,6)
d <- sim(m,n=500,seed=1)
nonlinear(m2) <- y~u1
val <- twostageCV(m1, m2, data=d, std.err=FALSE, df=2:6, nmix=1:2,
                   nfolds=2, mc.cores=1)
val

```

---

**vars***Extract variable names from latent variable model*

---

## Description

Extract exogenous variables (predictors), endogenous variables (outcomes), latent variables (random effects), manifest (observed) variables from a `lvm` object.

## Usage

```
vars(x,...)

endogenous(x,...)

exogenous(x,...)

manifest(x,...)

latent(x,...)

## S3 replacement method for class 'lvm'
exogenous(x, xfree = TRUE,...) <- value

## S3 method for class 'lvm'
exogenous(x,variable,latent=FALSE,index=TRUE,...)

## S3 replacement method for class 'lvm'
latent(x,clear=FALSE,...) <- value
```

## Arguments

<code>x</code>	lvm-object
<code>...</code>	Additional arguments to be passed to the low level functions
<code>variable</code>	list of variables to alter
<code>latent</code>	Logical defining whether latent variables without parents should be included in the result
<code>index</code>	For internal use only
<code>clear</code>	Logical indicating whether to add or remove latent variable status
<code>xfree</code>	For internal use only
<code>value</code>	Formula or character vector of variable names.

## Details

`vars` returns all variables of the `lvm`-object including manifest and latent variables. Similarly `manifest` and `latent` returns the observed resp. latent variables of the model. `exogenous` returns all manifest variables without parents, e.g. covariates in the model, however the argument `latent=TRUE` can be used to also include latent variables without parents in the result. By default lava will not include the parameters of the exogenous variables in the optimisation routine during estimation (likelihood of the remaining observed variables conditional on the covariates), however this behaviour can be altered via the assignment function `exogenous<-` telling lava which subset of (valid) variables to condition on. Finally `latent` returns a vector with the names of the latent variables in `x`. The assignment function `latent<-` can be used to change the latent status of variables in the model.

## Value

Vector of variable names.

## Author(s)

Klaus K. Holst

## See Also

[endogenous](#), [manifest](#), [latent](#), [exogenous](#), [vars](#)

## Examples

```
g <- lvm(eta1 ~ x1+x2)
regression(g) <- c(y1,y2,y3) ~ eta1
latent(g) <- ~eta1
endogenous(g)
exogenous(g)
identical(latent(g), setdiff(vars(g),manifest(g)))
```

## Description

`vec` operator

## Usage

```
vec(x, matrix = FALSE, sep = ". ", ...)
```

**Arguments**

x	Array
matrix	If TRUE a row vector (matrix) is returned
sep	Separator
...	Additional arguments

**Details**

Convert array into vector

**Author(s)**

Klaus Holst

wait	<i>Wait for user input (keyboard or mouse)</i>
------	--

**Description**

Wait for user input (keyboard or mouse)

**Usage**

```
wait()
```

**Author(s)**

Klaus K. Holst

wkm	<i>Weighted K-means</i>
-----	-------------------------

**Description**

Weighted K-means via Lloyd's algorithm

**Usage**

```
wkm(
  x,
  mu,
  data,
  weights = rep(1, NROW(x)),
  iter.max = 20,
  n.start = 5,
  init = "kmp",
  ...
)
```

**Arguments**

x	Data (or formula)
mu	Initial centers (or number centers chosen randomly among x)
data	optional data frame
weights	Optional weights
iter.max	Max number of iterations
n.start	Number of restarts
init	method to create initial centres (default kmeans++)
...	Additional arguments to lower level functions

**Author(s)**

Klaus K. Holst

---

**wrapvec**

*Wrap vector*

---

**Description**

Wrap vector

**Usage**

```
wrapvec(x, delta = 0L, ...)
```

**Arguments**

x	Vector or integer
delta	Shift
...	Additional parameters

**Examples**

```
wrapvec(5, 2)
```

---

**zibreg***Regression model for binomial data with unkown group of immortals*

---

## Description

Regression model for binomial data with unkown group of immortals (zero-inflated binomial regression)

## Usage

```
zibreg(
  formula,
  formula.p = ~1,
  data,
  family = stats::binomial(),
  offset = NULL,
  start,
  var = "hessian",
  ...
)
```

## Arguments

formula	Formula specifying
formula.p	Formula for model of disease prevalence
data	data frame
family	Distribution family (see the help page <code>family</code> )
offset	Optional offset
start	Optional starting values
var	Type of variance (robust, expected, hessian, outer)
...	Additional arguments to lower level functions

## Author(s)

Klaus K. Holst

## Examples

```
## Simulation
n <- 2e3
x <- runif(n,0,20)
age <- runif(n,10,30)
z0 <- rnorm(n,mean=-1+0.05*age)
z <- cut(z0,breaks=c(-Inf,-1,0,1,Inf))
p0 <- lava::expit(model.matrix(~z+age) %*% c(-.4, -.4, 0.2, 2, -0.05))
```

```

y <- (runif(n)<lava:::tigol(-1+0.25*x-0*age))*1
u <- runif(n)<p0
y[u==0] <- 0
d <- data.frame(y=y,x=x,u=u*1,z=z,age=age)
head(d)

## Estimation
e0 <- zibreg(y~x*z,~1+z+age,data=d)
e <- zibreg(y~x,~1+z+age,data=d)
compare(e,e0)
e
PD(e0,intercept=c(1,3),slope=c(2,6))

B <- rbind(c(1,0,0,0,20),
           c(1,1,0,0,20),
           c(1,0,1,0,20),
           c(1,0,0,1,20))
prev <- summary(e,pr.contrast=B)$prevalence

x <- seq(0,100,length.out=100)
newdata <- expand.grid(x=x,age=20,z=levels(d$z))
fit <- predict(e,newdata=newdata)
plot(0,0,type="n",xlim=c(0,101),ylim=c(0,1),xlab="x",ylab="Probability(Event)")
count <- 0
for (i in levels(newdata$z)) {
  count <- count+1
  lines(x,fit[which(newdata$z==i)],col="darkblue",lty=count)
}
abline(h=prev[3:4,1],lty=3:4,col="gray")
abline(h=prev[3:4,2],lty=3:4,col="lightgray")
abline(h=prev[3:4,3],lty=3:4,col="lightgray")
legend("topleft",levels(d$z),col="darkblue",lty=seq_len(length(levels(d$z))))
```

## Description

For matrices a block-diagonal matrix is created. For all other data types he operator is a wrapper of `paste`.

## Usage

```
x %++% y
```

## Arguments

<code>x</code>	First object
<code>y</code>	Second object of same class

**Details**

Concatenation operator

**Author(s)**

Klaus K. Holst

**See Also**

`blockdiag`, `paste`, `cat`,

**Examples**

```
## Block diagonal
matrix(rnorm(25),5) %++% matrix(rnorm(25),5)
## String concatenation
"Hello" "%++%" "World"
## Function composition
f <- log %++% exp
f(2)
```

`%ni%`

*Matching operator ( $x$  not in  $y$ ) oposed to the `%in%`-operator ( $x$  in  $y$ )*

**Description**

Matching operator

**Usage**

`x %ni% y`

**Arguments**

<code>x</code>	vector
<code>y</code>	vector of same type as <code>x</code>

**Value**

A logical vector.

**Author(s)**

Klaus K. Holst

**See Also**

`match`

%ni%

131

### Examples

```
1:10 %ni% c(1,5,10)
```
