Package 'localModel'

December 18, 2019

Title LIME-Based Explanations with Interpretable Inputs Based on Ceteris Paribus Profiles

Version 0.3.12

Author Mateusz Staniak [aut, cre], Przemyslaw Biecek [aut], Krystian Igras [ctb], Alicja Gosiewska [ctb]

Maintainer Mateusz Staniak <m.staniak@mini.pw.edu.pl>

Description Local explanations of machine learning models describe, how features contributed to a single prediction.
This package implements an explanation method based on LIME (Local Interpretable Model-agnostic Explanations, see Tulio Ribeiro, Singh, Guestrin (2016) <doi:10.1145/2939672.2939778>) in which interpretable inputs are created based on local rather than global behaviour of each original feature.

gaussian_kernel *LIME kernel from the original article with sigma = 1.*

Description

Since only binary features are used, the weight associated with an observation is simply exp(-{number of features that were changed compared to the original observation}). Kernels are meant to be used as an argument to individual_surrogate_model function. Other custom functions can be used. Such functions take two vectors and return a single number.

Usage

gaussian_kernel(explained_instance, simulated_instance)

Arguments

explained_instance explained instance simulated_instance new observation

Value

numeric

Examples

identity_kernel

```
# so closer observation have more weight.
model_lok
plot(model_lok)
```

identity_kernel

LIME kernel that treats all observations as equally similar to the observation of interest.

Description

Kernels are meant to be used as an argument to individual_surrogate_model function. Other custom functions can be used. Such functions take two vectors and return a single number.

Usage

identity_kernel(explained_instance, simulated_instance)

Arguments

explained_instance explained instance simulated_instance new observation

Value

numeric

Examples

```
individual_surrogate_model
```

LIME-like explanations based on Ceteris Paribus curves

Description

This function fits a LIME-type explanation of a single prediction. Interpretable binary features that describe the local impact of features on the prediction are created based on Ceteris Paribus Profiles. Thend, a new dataset of similar observations is created and black box model predictions (scores in case of classification) are calculated for this dataset and LASSO regression model is fitted to them. This way, explanations are simplified and include only the most important features. More details about the methodology can be found in the vignettes.

Usage

```
individual_surrogate_model(
    x,
    new_observation,
    size,
    seed = NULL,
    kernel = identity_kernel,
    sampling = "uniform",
    grid_points = 101
)
```

Arguments

| х | an explainer created with the function DALEX::explain(). |
|-----------------|--|
| new_observatior | 1 |
| | an observation to be explained. Columns in should correspond to columns in the data argument to x. |
| size | number of similar observation to be sampled. |
| seed | If not NULL, seed will be set to this value for reproducibility. |
| kernel | Kernel function which will be used to weight simulated observations. |
| sampling | Parameter that controls sampling while creating new observations. |
| grid_points | Number of points to use while calculating Ceteris Paribus profiles. |

Value

data.frame of class local_surrogate_explainer

localModel

Examples

localModel

localModel: LIME-like explanations with interpretable features based on Ceteris Paribus profiles

Description

This package implements LIME-like explanation method (see Tulio Ribeiro, Singh, Guestrin (2016) <doi:10.1145/2939672.2939778>) in which interpretable inputs are created based on local rather than global behaviour of each original feature.#'

Important functions

individual_surrogate_model generates an explanation for a single prediction with interpretable features based on Ceteris Paribus profiles. plot.local_surrogate_explainer plots the explanation.

plot.local_surrogate_explainer

Generic plot function for local surrogate explainers

Description

Generic plot function for local surrogate explainers

Usage

```
## S3 method for class 'local_surrogate_explainer'
plot(x, ..., geom = "point")
```

Arguments

| х | object of class local_surrogate_explainer |
|------|--|
| | other objects of class local_surrogate_explainer. If provided, models will be plotted in rows, response levels in columns. |
| geom | If "point", lines with points at the end will be plotted, if "bar", bars will be plotted and if "arrow", arrows. |

Examples

```
print.local_surrogate_explainer
```

Generic print function for local surrogate explainers

Description

Generic print function for local surrogate explainers

Usage

```
## S3 method for class 'local_surrogate_explainer'
print(x, ...)
```

Arguments

| Х | object of class local_surrogate_explainer |
|---|---|
| | currently ignored |

Examples

```
# Example based on apartments data from DALEX package.
library(DALEX)
library(randomForest)
library(localModel)
data('apartments')
```
