# Package 'mosaic' 

May 18, 2020
Type Package
Title Project MOSAIC Statistics and Mathematics Teaching Utilities
Version 1.7.0
Description Data sets and utilities from Project MOSAIC ([http://mosaic-web.org](http://mosaic-web.org)) used to teach mathematics, statistics, computation and modeling. Funded by the NSF, Project MOSAIC is a community of educators working to tie together aspects of quantitative work that students in science, technology, engineering and mathematics will need in their professional lives, but which are usually taught in isolation, if at all.
Depends R ( $>=3.0 .0$ ), dplyr, lattice ( $>=0.20-21$ ), ggformula, mosaicData, Matrix
Imports mosaicCore (>=0.5.0), ggplot2, ggrepel, rlang, MASS, grid, tidyr, readr, methods, utils, splines, latticeExtra, ggdendro, gridExtra, glue, broom, leaflet
Suggests vdiffr, lubridate, magrittr, NHANES, RCurl, sp, maptools, vcd, testthat, knitr, tools, parallel, mapproj, rgl, rmarkdown, covr, formatR
Enhances manipulate
VignetteBuilder knitr
License GPL (>=2)
LazyLoad yes

mosaic-package mosaic: the Project MOSAIC package

## Description

mosaic

## Details

Data sets and utilities from Project MOSAIC (mosaic-web.org) used to teach mathematics, statistics, computation and modeling. Funded by the NSF, Project MOSAIC is a community of educators working to tie together aspects of quantitative work that students in science, technology, engineering and mathematics will need in their professional lives, but which are usually taught in isolation, if at all.

## Author(s)

Randall Pruim ([rpruim@calvin.edu](mailto:rpruim@calvin.edu)), Daniel Kaplan ([kaplan@macalester.edu](mailto:kaplan@macalester.edu)), Nicholas Horton ([nhorton@smith.edu](mailto:nhorton@smith.edu))

## References

http://mosaic-web.org

## Description

adapt_seq is similar to seq except that instead of selecting points equally spaced along an interval, it selects points such that the values of a function applied at those points are (very) roughly equally spaced. This can be useful for sampling a function in such a way that it can be plotted more smoothly, for example.

## Usage

```
    adapt_seq(
        from,
        to,
        length.out = 200,
        f = function(x, ...) { 1 },
        args = list(),
        quiet = FALSE
    )
```

## Arguments

| from | start of interval |
| :--- | :--- |
| to | end of interval |
| length. out | desired length of sequence |
| f | a function |
| args | arguments passed to f |
| quiet | suppress warnings about NaNs, etc. |

Value
a numerical vector

## Examples

```
adapt_seq(0, pi, 25, sin)
```

## Description

aggregatinFuntion1 creates statistical summaries of one numerical vector that are formula aware.

```
Usage
    aggregatingFunction1(
        fun,
        output.multiple = FALSE,
        envir = parent.frame(),
        na.rm = getOption("na.rm", FALSE),
        style = c("formula1st", "formula", "flexible")
    )
```

## Arguments

fun a function that takes a numeric vector and computes a summary statistic, returning a numeric vector.
output.multiple a boolean indicating whether fun returns multiple values
envir an environment in which evaluation takes place.
na.rm the default value for na.rm in the resulting function.
style one of "formula1st", "formula2nd" or "flexible". In the first two cases, the first argument must be a formula or evaluate to an object. In the latter case, bare names will be converted into formulas.

## Details

The logic of the resulting function is this: 1) If the first argument is a formula, use that formula and data to create the necessary call(s) to fun; (2) Else simply pass everything to fun for evaluation.

## Value

a function that generalizes fun to handle a formula/data frame interface.

## Note

Earlier versions of this function supported a "bare name + data frame" interface. This functionality has been removed since it was (a) ambiguous in some cases, (b) unnecessary, and (c) difficult to maintain.

## Examples

```
if (require(mosaicData)) {
    foo <- aggregatingFunction1(base::mean)
    foo( ~ length, data = KidsFeet)
    base::mean(KidsFeet$length)
    foo(length ~ sex, data = KidsFeet)
}
```

aggregatingFunction1or2
1- or 2-ary aggregating functions

## Description

aggregatingFunction1or2() creates statistical summaries for functions like var() that can have either 1 or 2 numeric vector inputs.

## Usage

aggregatingFunction1or2(
fun, output.multiple = FALSE, na.rm = getOption("na.rm", FALSE)
)

## Arguments

fun a function that takes 1 or 2 numeric vectors and computes a summary statistic, returning a numeric vector of length 1 .
output.multiple
a boolean indicating whether fun returns multiple values
na.rm the default value for na.rm in the resulting function.

## Details

This was designed primarily to support var which can be used to compute either the variance of one variable or the covariance of two variables. The logic of the resulting function is this: 1) If the first two arguments are both formulas, then those formulas are evaluated (with data) to compute the covariance; (2) If the first argument is a formula, and the second is NULL, then the formula and data are used to create the necessary call(s) to fun; (3) Else everything is simply passed to fun for evaluation.

## Note

Earlier versions of this function supported a "bare name + data frame" interface. This functionality has been removed since it was (a) ambiguous in some cases, (b) unnecessary, and (c) difficult to maintain.

```
aggregatingFunction2 2-ary aggregating functions
```

## Description

aggregatinFuntion2 creates statistical summaries of two numerical vectors that are formula aware.

## Usage

aggregatingFunction2(fun)

## Arguments

fun a function that takes two numeric vectors and computes a summary statistic, returning a numeric vector of length 1 .

## Details

This was designed to support functions like $\operatorname{cov}()$ which can be used to compute numerical summaries from two numeric vectors. The logic of the resulting function is this: 1) If the first two arguments are both formulas, then those formulas are evaluated (with data) to compute the covariance; (2) If the first argument is a formula, and the second is NULL, then the left and ride sides of the formula and data are used to create the vectors passed to fun; (3) Else everything is simply passed to fun for evaluation.

## Value

a function that generalizes fun to handle a formula/data frame interface.

## Note

Earlier versions of this function supported a "bare name + data frame" interface. This functionality has been removed since it was (a) ambiguous in some cases, (b) unnecessary, and (c) difficult to maintain.

## Examples

```
if(require(mosaicData)) {
    foo <- aggregatingFunction2(stats::cor)
    foo(length ~ width, data = KidsFeet)
    stats::cor(KidsFeet$length, KidsFeet$width)
}
```

```
as.xtabs Convert objects to xtabs format
```

## Description

Convert a data frame or a matrix into an xtabs object.

## Usage

```
as.xtabs(x, ...)
    ## S3 method for class 'data.frame'
    as.xtabs(x, rowvar = NULL, colvar = NULL, labels = 1, ...)
    ## S3 method for class 'matrix'
    as.xtabs(x, rowvar = NULL, colvar = NULL, ...)
```

## Arguments

$$
\begin{array}{ll}
\text { x } & \text { object (typically a data frame) to be converted to xtabs format } \\
\ldots & \text { additional arguments to be passed to or from methods. } \\
\text { rowvar } & \text { name of the row variable as character string } \\
\text { colvar } & \text { name of the column variable as character string } \\
\text { labels } & \text { column of data frame that contains the labels of the row variable. }
\end{array}
$$

## Details

The intended use is to convert a two-way contingency table stored in a data frame or a matrix into an xtabs object.

## Value

An xtabs object.

## Examples

```
# example from example(fisher.test)
df <- data.frame( X=c('Tea','Milk'), Tea=c(3,1), Milk=c(1,3) )
xt <- as.xtabs(df, rowvar="Guess", colvar="Truth"); xt
if (require(vcd)) { mosaic(xt) }
```

## Description

An ASH plot is the average over all histograms of a fixed bin width.

```
Usage
    ashplot(
        x,
        data = data,
        ...,
        width = NULL,
        adjust = NULL,
        panel = panel.ashplot,
        prepanel = prepanel.default.ashplot
    )
    prepanel.default.ashplot(x, darg, groups = NULL, subscripts = TRUE, ...)
    panel.ashplot(
        x,
        darg = list(),
        plot.points = FALSE,
        ref = FALSE,
        groups = NULL,
        jitter.amount = 0.01 * diff(current.panel.limits()$ylim),
        type = "p",
        ...,
        identifier = "ash"
    )
```

## Arguments

x
data
...
width
adjust
panel
prepanel
darg

A formula or numeric vector.
A data frame.
Additional arguments passed to panel and prepanel functions or data, a data frame in which to find the variables used for the plot.
The histogram bin width.
A numeric adjustment to width. Primarily useful when width is not specified. Increasing adjust makes the plot smoother.
A panel function.
A prepanel function.
a list of arguments for the function computing the ASH.
groups as in other lattice plots
subscripts as in other lattice prepanel functions
plot.points One of TRUE, FALSE, "jitter", or "rug"
ref a logical indicating whether a reference line should be displayed
jitter.amount when plot.points="jitter", the value to use as the amount argument to jitter().
type type argument used to plot points, if requested. This is not expected to be useful, it is available mostly to protect a type argument, if specified, from affecting the display of the ASH.
identifier A character string that is prepended to the names of i grobs that are created by this panel function.

## Examples

```
ashplot( ~age | substance, groups = sex, data = HELPrct)
```

bargraph Create bar graphs from raw data

## Description

lattice: :barchart () from the lattice package makes bar graphs from pre-tabulated data. Raw data can be tabulated using xtabs(), but the syntax is unusual compared to the other lattice plotting functions. bargraph provides an interface that is consistent with the other lattice functions.

```
Usage
    bargraph(
        x,
        data = parent.frame(),
        groups = NULL,
        horizontal = FALSE,
        origin = 0,
        ylab = ifelse(horizontal, "", type),
        xlab = ifelse(horizontal, type, ""),
        type = c("count", "frequency", "proportion", "percent"),
        auto.key = TRUE,
        scales = list(),
    )
```

## Arguments

| x | a formula describing the plot |
| :---: | :---: |
| data | a data frame in which the formula x is evaluated |
| groups | a variable or expression used for grouping. See lattice: :barchart(). |
| horizontal | a logical indicating whether bars should be horizontal |
| origin | beginning point for bars. For the default behavior used by lattice: : barchart() set origin to NULL, but 0 is often a better default. If 0 is not good, perhaps you should use a different kind of plot as the results may be misleading. |
| ylab | a character vector of length one used for the y-axis label |
| xlab | a character vector of length one used for the x -axis label |
| type | one of "frequency", "count", "percent", or "proportion" indicating what type of scale to use. Unique prefixes are sufficient. |
| auto.key | a logical expression indicating whether a legend should be automatically produced |
| scales | is a list determining how the x - and y -axes are drawn |
|  | additional arguments passed to lattice: :barchart() |

## Details

bargraph (formula, data=data, . . ) works by creating a new data frame from xtabs (formula, data=data) and then calling lattice::barchart() using modified version of the formula and this new data frame as inputs. This has implications on, for example, conditional plots where one desires to condition on some expression that will be evaluated in data. This typically does not work because the required variables do not exist in the output of xtabs. One solution is to first add a new variable to data first and then to condition using this new variable. See the examples.

## Value

a trellis object describing the plot

## See Also

lattice::barchart()

## Examples

```
if (require(mosaicData)) {
data(HELPrct)
bargraph( ~ substance, data = HELPrct)
bargraph( ~ substance, data = HELPrct, horizontal = TRUE)
bargraph( ~ substance | sex, groups = homeless, auto.key = TRUE, data = HELPrct)
bargraph( ~ substance, groups = homeless, auto.key=TRUE,
    data = HELPrct %>% filter(sex == "male"))
HELPrct2 <- mutate(HELPrct, older = age > 40)
bargraph( ~ substance | older, data = HELPrct2)
}
```

## Description

The binom.test() function performs an exact test of a simple null hypothesis about the probability of success in a Bernoulli experiment from summarized data or from raw data. The mosaic binom. test provides wrapper functions around the function of the same name in stats. These wrappers provide an extended interface (including formulas).

## Usage

binom.test
x ,
$\mathrm{n}=\mathrm{NULL}$,
p = 0.5,
alternative = c("two.sided", "less", "greater"),
conf.level = 0.95,
ci.method = c("Clopper-Pearson", "binom.test", "Score", "Wilson", "prop.test",
"Wald", "Agresti-Coull", "Plus4"),
data $=$ NULL,
success = NULL,
. . .
)

## Arguments

| x | count of successes, length 2 vector of success and failure counts, a formula, or a <br> character, numeric, or factor vector containing raw data. |
| :--- | :--- |
| n | sample size (successes + failures) or a data frame (for the formula interface) <br> p |
| alternative | probability for null hypothesis <br> type of alternative hypothesis <br> conf. level |
| ci.method | a method to use for computing the confidence interval (case insensitive and may <br> be abbreviated). See details below. |
| data | a data frame (if missing, $n$ may be a data frame) |
| success | level of variable to be considered success. All other levels are considered failure. |
| $\ldots$ | additional arguments (often ignored) |

## Details

binom.test() is a wrapper around stats: :binom.test() from the stats package to simplify its use when the raw data are available, in which case an extended syntax for binom.test() is provided. See the examples.

Also, five confidence interval methods are provided: * "Clopper-Pearson", "binom.test": This is the interval produced when using stats: : binom. test() from the stats package. It guarantees a coverage rate at least as large as the nominal coverage rate, but may produce wider intervals than some of the methods below, which may either under- or over-cover depending on the data.

- ‘"Score", "Wilson", "prop.test": This is the usual method used by stats::prop.test() and is computed by inverting p-values from score tests. It is often attributed to Edwin Wilson. If specified with "prop.test", the continuity correction is applied (as is the default in prop. test ()), else the continuity correction is not applied.
_ "Wald" This is the interval traditionally taught in entry level statistics courses. It uses the sample proportion to estimate the standard error and uses normal theory to determine how many standard deviations to add and/or subtract from the sample proportion to determine an interval.
- \"Agresti-Coull"' This is the Wald method after setting $n^{\prime}=n+z^{2}$ and $p^{\prime}=(x+$ $\left.z^{2} / 2\right) / n^{\prime}$ and using $x^{\prime}=n^{\prime} p^{\prime}$ and $n^{\prime}$ in place of $x$ and $n$.
- "Plus4" This is Wald after adding in two artificial success and two artificial failures. It is nearly the same as the Agresti-Coull method when the confidence level is $95 \%$. since $z^{2}$ is approximately 4 and $z^{2} / 2$ is approximately 2 .

## Value

an object of class htest

## Note

When $x$ is a $0-1$ vector, 0 is treated as failure and 1 as success. Similarly, for a logical vector TRUE is treated as success and FALSE as failure.

## See Also

mosaic::prop.test(), stats: :binom.test()

## Examples

```
# Several ways to get a confidence interval for the proportion of Old Faithful
# eruptions lasting more than 3 minutes.
data(faithful)
binom.test(faithful$eruptions > 3)
binom.test(97, 272)
binom.test(c(97, 272-97))
faithful$long <- faithful$eruptions > 3
binom.test(faithful$long)
binom.test(resample(1:4, 400), p=.25)
binom.test(~ long, data = faithful)
binom.test(~ long, data = faithful, ci.method = "Wald")
binom.test(~ long, data = faithful, ci.method = "Plus4")
with(faithful, binom.test(~long))
with(faithful, binom.test(long))
```

Broyden Multi-Dimensional Root Finding

## Description

Implementation of Broyden's root finding function to numerically compute the root of a system of nonlinear equations

## Usage

Broyden(system, vars, $x=0$, tol $=$. Machine\$double.eps^0.4, maxiters $=10000$ )

## Arguments

| system | A list of functions |
| :--- | :--- |
| vars | A character string list of variables that appear in the functions |
| $x$ | A starting vector |
| tol | The tolerance for the function specifying how precise it will be |
| maxiters | maximum number of iterations. |

```
cdist Central portion of a distribution
```

## Description

This function determines the critical values for isolating a central portion of a distribution with a specified probability. This is designed to work especially well for symmetric distributions, but it can be used with any distribution.

## Usage

cdist
dist = "norm",
p,
plot = TRUE,
verbose = FALSE,
invisible = FALSE,
digits = 3L,
xlim,
ylim,
resolution = 500L,
return = c("values", "plot"),
pattern = c("rings", "stripes"),
...,

```
    refinements = list()
)
xcgamma(
    p,
    shape,
    rate = 1,
    scale = 1/rate,
    lower.tail = TRUE,
    log.p = FALSE,
)
xct(p, df, ncp, lower.tail = TRUE, log.p = FALSE, ...)
xcchisq(p, df, ncp = 0, lower.tail = TRUE, log.p = FALSE, ...)
xcf(p, df1, df2, lower.tail = TRUE, log.p = FALSE, ...)
xcbinom(p, size, prob, lower.tail = TRUE, log.p = FALSE, ...)
xcpois(p, lambda, lower.tail = TRUE, log.p = FALSE, ...)
xcgeom(p, prob, lower.tail = TRUE, log.p = FALSE, ...)
xcnbinom(p, size, prob, mu, lower.tail = TRUE, log.p = FALSE, ...)
xcbeta(p, shape1, shape2, ncp = 0, lower.tail = TRUE, log.p = FALSE, ...)
```

## Arguments

| dist | a character string naming a distribution family (e.g., "norm"). This will work for any family for which the usual $\mathrm{d} / \mathrm{p} / \mathrm{q}$ functions exist. |
| :---: | :---: |
| p | the proportion to be in the central region, with equal proportions in either "tail". |
| plot | a logical indicating whether a plot should be created |
| verbose | a logical indicating whether a more verbose output value should be returned. |
| invisible | a logical |
| digits | the number of digits desired |
| $x \mathrm{lim}$ | x limits. By default, these are chosen to show the central $99.8 \backslash$ of the distribution. |
| ylim | $y$ limits |
| resolution | number of points used for detecting discreteness and generating plots. The default value of 5000 should work well except for discrete distributions that have many distinct values, especially if these values are not evenly spaced. |
| return | If "plot", return a plot. If "values", return a vector of numerical values. |
| pattern | One of "stripes" or "rings". In the latter case, pairs of regions (from the outside to the inside) are grouped together for coloring and probability calculation. |

|  | additional arguments passed to the distribution functions. Typically these specify the parameters of the particular distribution desired. See the examples. |
| :---: | :---: |
| refinements | A list of refinements to the plot. See ggformula: :gf_refine(). |
| shape | shape and scale parameters. Must be positive, scale strictly. |
| rate | an alternative way to specify the scale. |
| scale | shape and scale parameters. Must be positive, scale strictly. |
| lower.tail | logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X>x]$. |
| log.p | logical; if TRUE, probabilities/densities $p$ are returned as $\log (p)$. |
| df | degrees of freedom ( $>0$, maybe non-integer). $\mathrm{df}=\mathrm{Inf}$ is allowed. |
| ncp | non-centrality parameter $\delta$; currently except for $\mathrm{rt}($ ), only for $\mathrm{abs}(\mathrm{ncp})<=$ 37.62. If omitted, use the central $t$ distribution. |
| df1 | degrees of freedom. Inf is allowed. |
| df2 | degrees of freedom. Inf is allowed. |
| size | number of trials (zero or more). |
| prob | probability of success on each trial. |
| lambda | vector of (non-negative) means. |
| mu | alternative parametrization via mean: see 'Details'. |
| shape1 | non-negative parameters of the Beta distribution. |
| shape2 | non-negative parameters of the Beta distribution. |

## Value

a pair of numbers indicating the upper and lower bounds, unless verbose is TRUE, in which case a 1 -row data frame is returned containing these bounds, the central probability, the tail probabilities, and the name of the distribution.

## Note

This function is still experimental and changes the input or output formats are possible in future versions of the package.

## Examples

```
cdist( "norm", .95)
cdist( "t", c(.90, .95, .99), df=5)
cdist( "t", c(.90, .95, .99), df=50)
# plotting doesn't work well when the parameters are not constant
cdist( "t", .95, df=c(3,5,10,20), plot = FALSE)
cdist( "norm", .95, mean=500, sd=100 )
cdist( "chisq", c(.90, .95), df=3 )
# CI
x <- rnorm(23, mean = 10, sd = 2)
cdist("t", p = 0.95, df=22)
mean(x) + cdist("t", p = 0.95, df=22) * sd(x) / sqrt(23)
confint(t.test(x))
cdist("t", p = 0.95, df=22, verbose = TRUE)
```

chisq Extract Chi-squared statistic

## Description

Extract Chi-squared statistic

## Usage

```
chisq(x, ...)
## S3 method for class 'htest'
chisq(x, ...)
## S3 method for class 'table'
chisq(x, correct = FALSE, ...)
## Default S3 method:
chisq(x, correct = FALSE, ...)
```

## Arguments

x
An object of class "htest" a coming from a Chi-squared test, an object of class "table", or the inputs to tally().
... additional arguments passed on to tally or chisq. test.
correct a logical indicating whether a continuity correction should be applied.

See Also

```
stat()
```

## Examples

```
if(require(mosaicData)) {
    Mites.table <- tally( ~ outcome + treatment, data=Mites )
    Mites.table
    chisq.test(Mites.table)
    chisq(Mites.table)
    chisq(chisq.test(Mites.table))
    ## Randomization test. Increase replications to decrease Monte Carlo error.
    do(3) * chisq( tally( ~ outcome + shuffle(treatment), data=Mites ) )
    Mites.rand <- do(1000) * chisq( tally( ~ outcome + shuffle(treatment), data=Mites ) )
    tally( ~(X.squared >= chisq(Mites.table)), data=Mites.rand, format="proportion")
}
```

## Description

This function can be used in two different ways. Without an argument, it returns a reference table that includes information about all the CIA World Factbook tables that are available through this function. Note the Name column that indicates a unique name for each available dataset. If this name is passed as an argument to the function, the function will return the corresponding dataset.

## Usage

CIAdata(name = NULL)

## Arguments

name An optional parameter specifying the name of the desired dataset. If multiple names are given, a merge will be attempted on the individual data sets.

## Examples

```
## Not run:
head(CIAdata())
Population <- CIAdata("pop")
nrow(Population)
head(Population)
PopArea <-
    CIAdata(c("pop","area")) %>%
    mutate(density = pop / area)
    nrow(PopArea)
    head(PopArea)
    PopArea %>%
        filter(!is.na(density)) %>%
        arrange(density) %>%
        tail()
    ## End(Not run)
```

    CIsim
        Compute confidence intervals from (multiple) simulated data sets
    
## Description

This function automates the calculation of coverage rates for exploring the robustness of confidence interval methods.

## Usage

```
CIsim(
        n,
        samples = 100,
        rdist = rnorm,
        args = list(),
        plot = if (samples <= 200) "draw" else "none",
        estimand = 0,
        conf.level = 0.95,
        method = t.test,
        method.args = list(),
        interval = function(x) { do.call(method, c(list(x, conf.level = conf.level),
        method.args))$conf.int },
    estimate = function(x) { do.call(method, c(list(x, conf.level = conf.level),
        method.args))$estimate },
    verbose = TRUE
)
```

## Arguments

| n | size of each sample |
| :--- | :--- |
| samples | number of samples to simulate |
| rdist | function used to draw random samples |
| args | arguments required by rdist |
| plot | one of "print", "return", "horizontal", or "none" describing whether a plot <br> should be printed, returned, printed with horizontal intervals, or not generated <br> at all. |
| estimand | true value of the parameter being estimated |
| conf.level | confidence level for intervals <br> function used to compute intervals. Standard functions that produce an object <br> of class htest can be used here. |
| method | arguments required by method <br> a function that computes a confidence interval from data. Function should return |
| interval | a vector of length 2. |
| estimate | a function that computes an estimate from data |
| verbose | print summary to screen? |

## Value

A data frame with variables lower, upper, estimate, cover ('Yes' or 'No'), and sample is returned invisibly. See the examples for a way to use this to display the intervals graphically.

## Examples

```
    # 1000 95% intervals using t.test; population is N(0,1)
    CIsim(n=10, samples=1000)
    # this time population is Exp(1); fewer samples, so we get a plot
    CIsim(n=10, samples=100, rdist=rexp, estimand=1)
    # Binomial treats 1 like success, 0 like failure
    CIsim(n=30, samples=100, rdist=rbinom, args=list(size=1, prob=.7),
        estimand = .7, method = binom.test, method.args=list(ci = "Plus4"))
```

## cnorm

Central Probability in a Normal or T Distribution

## Description

These versions of the quantile functions take a vector of central probabilities as its first argument.

## Usage

```
cnorm(p, mean = 0, sd = 1, log.p = FALSE, side = c("both", "upper", "lower"))
ct(p, df, ncp, log.p = FALSE, side = c("upper", "lower", "both"))
```

## Arguments

p
mean vector of means.
sd vector of standard deviations.
log.p logical; if TRUE, probabilities p are given as $\log (\mathrm{p})$.
side One of "upper", "lower", or "both" indicating whether a vector of upper or lower quantiles or a matrix of both should be returned.
df degrees of freedom ( $>0$, maybe non-integer). $\mathrm{df}=\mathrm{Inf}$ is allowed.
ncp non-centrality parameter $\delta$; currently except for $\mathrm{rt}($ ), only for abs(ncp) <= 37.62. If omitted, use the central $t$ distribution.

See Also

```
stats::qnorm(),cdist()
```

## Examples

```
qnorm(.975)
cnorm(.95)
xcnorm(.95)
xcnorm(.95, verbose = FALSE, return = "plot") %>%
        gf_refine(
        scale_fill_manual( values = c("navy", "limegreen")),
        scale_color_manual(values = c("black", "black")))
cnorm(.95, mean = 100, sd = 10)
xcnorm(.95, mean = 100, sd = 10)
```

    compareMean Defunct functions
    
## Description

The following functions were once a part of the mosaic pacakge but have been removed. In some cases, an alternative is available and is suggested if you attempt to execute the function.

## Usage

```
compareMean(...)
compareProportion(...)
    deltaMethod(...)
    gwm(...)
    r.squared(...)
    mm(...)
    perctable(...)
    proptable(...)
    xhistogram(...)
```

## Arguments

.. arguments, ignored since the function is defunct

## confint Confidence interval methods for output of resampling

## Description

Methods for confint to compute confidence intervals on numerical vectors and numerical components of data frames.

## Usage

```
    ## S3 method for class 'numeric'
```

    confint (
        object,
        parm,
        level \(=0.95\),
    ...,
    method = "percentile",
    margin.of.error = "stderr" \%in\% method == "stderr"
    )
    \#\# S3 method for class 'do.tbl_df'
    confint(
        object,
        parm,
        level \(=0.95\),
        ...,
        method = "percentile",
        margin.of.error = "stderr" \%in\% method,
        \(d f=\) NULL
    )
    \#\# S3 method for class 'do.data.frame'
    confint (
    object,
    parm,
    level = 0.95,
    ...,
    method = "percentile",
    margin.of.error = "stderr" \%in\% method,
        \(d f=\) NULL
    )
    \#\# S3 method for class 'data.frame'
    confint(object, parm, level = 0.95, ...)
    \#\# S3 method for class 'summary.lm'
    confint(object, parm, level \(=0.95, \ldots\) )
    
## Arguments

```
    object and R object
    parm a vector of parameters
    level a confidence level
    additional arguments
    method a character vector of methods to use for creating confidence intervals. Choices
        are "percentile" (or "quantile") which is the default, "stderr" (or "se"), "bootstrap-
        t", and "reverse" (or "basic"))
    margin.of.error
            if true, report intervals as a center and margin of error.
    df degrees for freedom. This is required when object was produced using link{do}
        when using the standard error to compute the confidence interval since typically
        this information is not recorded in these objects. The default (Inf) uses a normal
        critical value rather than a one derived from a t-distribution.
```

## Details

The methods of producing confidence intervals from bootstrap distributions are currently quite naive. In particular, when using the standard error, assistance may be required with the degrees of freedom, and it may not be possible to provide a correct value in all situations. None of the methods include explicit bias correction. Let $q_{a}$ be the $a$ quantile of the bootstrap distribution, let $t_{a}, d f$ be the $a$ quantile of the $t$ distribution with $d f$ degrees of freedom, let $S E_{b}$ be the standard deviation of the bootstrap distribution, and let $\hat{\theta}$ be the estimate computed from the original data. Then the confidence intervals with confidence level $1-2 a$ are
quantile $\left(q_{a}, q_{1-a}\right)$
reverse $\left(2 \hat{\theta}-q_{1-a}, 2 \hat{\theta}-q_{a}\right)$
$\operatorname{stderr}\left(\hat{\theta}-t_{1-a, d f} S E_{b}, \hat{\theta}+t_{1-a, d f} S E_{b}\right)$. When df is not provided, at attempt is made to determine an appropriate value, but this should be double checked. In particular, missing data an lead to unreliable results.
The bootstrap-t confidence interval is computed much like the reverse confidence interval but the bootstrap $t$ distribution is used in place of a theoretical $t$ distribution. This interval has much better properties than the reverse (or basic) method, which is here for comparison purposes only and is not recommended. The t-statistic is computed from a mean, a standard deviation, a sample size which much be named "mean", "sd", and " $n$ " as they are when using favstats().

## Value

When applied to a data frame, returns a data frame giving the confidence interval for each variable in the data frame using t.test or binom. test, unless the data frame was produced using do, in which case it is assumed that each variable contains resampled statistics that serve as an estimated sampling distribution from which a confidence interval can be computed using either a central proportion of this distribution or using the standard error as estimated by the standard deviation of the estimated sampling distribution. For the standard error method, the user must supply the correct
degrees of freedom for the $t$ distribution since this information is typically not available in the output of do().
When applied to a numerical vector, returns a vector.

## Examples

```
if (require(mosaicData)) {
    bootstrap <- do(500) * diffmean( age ~ sex, data = resample(HELPrct) )
    confint(bootstrap)
    confint(bootstrap, method = "percentile")
    confint(bootstrap, method = "boot")
    confint(bootstrap, method = "se", df = nrow(HELPrct) - 1)
    confint(bootstrap, margin.of.error = FALSE)
    confint(bootstrap, margin.of.error = TRUE, level = 0.99,
        method = c("se", "perc") )
    # bootstrap t method requires both mean and sd
    bootstrap2 <- do(500) * favstats(resample(1:10))
    confint(bootstrap2, method = "boot")
}
lm(width ~ length * sex, data = KidsFeet) %>%
    summary() %>%
    confint()
```

confint.htest

Extract summary statistics

## Description

Extract confidence intervals, test statistics or p-values from an htest object.

## Usage

\#\# S3 method for class 'htest'
confint(object, parm, level, ...)
pval(x, ...)
\#\# S3 method for class 'htest'
pval(x, digits = 4, verbose = FALSE, ...)
stat(x, ...)

```
## S3 method for class 'htest'
stat(x, ...)
## S3 method for class 'uneval'
stat(x, ...)
```

## Arguments

object a fitted model object or an htest object.
parm a specification of which parameters are to be given confidence intervals, either a vector of numbers or a vector of names. If missing, all parameters are considered.
level the confidence level required.
... Additional arguments.
$x \quad$ An object of class htest.
digits number of digits to display in verbose output
verbose a logical

## Value

the extracted p-value, confidence interval, or test statistic

## Examples

```
confint(t.test(rnorm(100)))
pval(t.test(rnorm(100)))
stat(t.test(rnorm(100)))
confint(var.test(rnorm(10,sd=1), rnorm(20, sd=2)))
pval(var.test(rnorm(10,sd=1), rnorm(20, sd=2)))
    if (require(mosaicData)) {
    data(HELPrct)
    stat(t.test (age ~ shuffle(sex), data=HELPrct))
    # Compare to test statistic computed with permuted values of sex.
    do(10) * stat(t.test (age ~ shuffle(sex), data=HELPrct))
    }
```

    cor_test.formula Alternative formula interface for cor.test
    
## Description

stats: : cor.test() in stats accepts formulas of the shape $\sim y+x$. The mosaic package allows the use of $y \sim x$ as an alternative formula shape.

## Usage

```
\#\# S3 method for class 'formula'
cor_test(formula, ...)
    cor.test(x, ...)
    cor_test(x, ...)
    \#\# Default S3 method:
    cor_test(x, y, ...)
```

## Arguments

| formula | a formula |
| :--- | :--- |
| $\ldots$ | other arguments passed to stats : : cor. test (). |
| $x, y$ | numeric vectors of data values. $x$ and $y$ must have the same length. |

## See Also

stats: :cor.test() in the stats package.

## Examples

```
# This is an example from example(stats::cor.test) done in old and new style
require(graphics)
cor.test(~ CONT + INTG, data = USJudgeRatings)
cor.test(CONT ~ INTG, data = USJudgeRatings)
```

## cross <br> Factor cross products

## Description

Construct a product of factors.

## Usage

cross(..., sep = ":", drop.unused.levels = FALSE)

## Arguments

$$
\begin{array}{ll}
\ldots & \text { factors to be crossed. } \\
\text { sep } & \text { separator between levels } \\
\text { drop. unused.levels }
\end{array}
$$

should levels that do not appear in cross product be dropped?

## Value

a factor

## Examples

x <- letters[1:3]
$y<-c(1,2,1,1,3,1,3)$
$\operatorname{cross}(x, y)$
cross(x, y, drop.unused.levels=TRUE)

```
cull_for_do Cull objects used with do()
```

## Description

The do() function facilitates easy replication for randomization tests and bootstrapping (among other things). Part of what makes this particularly useful is the ability to cull from the objects produced those elements that are useful for subsequent analysis. cull_for_do does this culling. It is generic, and users can add new methods to either change behavior or to handle additional classes of objects.

## Usage

```
cull_for_do(object, ...)
```

## Arguments

object an object to be culled
... additional arguments (currently ignored)

## Details

When do( $n$ ) * expression is evaluated, expression is evaluated $n$ times to produce a list of $n$ result objects. cull_for_do is then applied to each element of this list to extract from it the information that should be stored. For example, when applied to a object of class "lm", the default cull_for_do extracts the coefficients, coefficient of determinism, an the estimate for the variance, etc.

## Examples

```
cull_for_do(lm(length ~ width, data = KidsFeet))
do(1) * lm(length ~ width, data = KidsFeet)
```

## deg2rad <br> Convert between degrees and radians

## Description

Facilitates conversion between degrees and radians.

## Usage

deg2rad (x)
rad2deg(x)

## Arguments

$x \quad$ a numeric vector

## Value

a numeric vector

## See Also

latlon2xyz(), googleMap(), and rgeo().

## Examples

deg2rad(180)
rad2deg(2*pi)

```
derivedVariable Create new variables from logicals
```

## Description

Utility functions for creating new variables from logicals describing the levels

## Usage

derivedVariable(
... ,
.ordered = FALSE,
.method = c("unique", "first", "last"),
.debug = c("default", "always", "never"),
.sort = c("given", "alpha"),
.default = NULL,

```
    .asFactor = FALSE
)
derivedFactor(..., .asFactor = TRUE)
```

## Arguments

|  | named logical "rules" defining the levels. |
| :---: | :---: |
| . ordered | a logical indicating whether the resulting factored should be ordered Ignored if . asFactor is FALSE. |
| .method | one of "unique", "first", and "last". If "unique", exactly one rule must be TRUE for each position. If "first", the first TRUE rule defines the level. If "last", the last TRUE rule defines the level. |
| . debug | one of "default", "always", and "never", indicating whether debugging information should be printed. If "default", debugging information is printed only when multiple rules give conflicting definitions for some positions. |
| . sort | One of "given" (the default) or "alpha" or a vector of integers the same length as the number of levels indicating the order in which the levels should appear in the resulting factor. Ignored if . asFactor is FALSE. |
| . default | character vector of length 1 giving name of default level or NULL for no default. |
| . asFactor | A logical indicating whether the returned value should be a factor. |

## Details

Each logical "rule" corresponds to a level in the resulting variable. If .default is defined, an implicit rule is added that is TRUE whenever all other rules are FALSE. When there are multiple TRUE rules for a slot, the first or last such is used or an error is generated, depending on the value of method.
derivedVariable is designed to be used with transform() or dplyr::mutate() to add new variables to a data frame. derivedFactor() is the same but that the default value for .asFactor is TRUE. See the examples.

## Examples

```
Kf <- mutate(KidsFeet, biggerfoot2 = derivedFactor(
    dom = biggerfoot == domhand,
    nondom = biggerfoot != domhand)
    )
tally( ~ biggerfoot + biggerfoot2, data = Kf)
tally( ~ biggerfoot + domhand, data = Kf)
# Three equivalent ways to define a new variable
# Method 1: explicitly define all levels
modHELP <- mutate(HELPrct, drink_status = derivedFactor(
    abstinent = i1 == 0,
    moderate = (i1>0 & i1<=1 & i2<=3 & sex=='female') |
        (i1>0 & i1<=2 & i2<=4 & sex=='male'),
    highrisk = ((i1>1 | i2>3) & sex=='female') |
```

```
            ((i1>2 | i2>4) & sex=='male'),
        .ordered = TRUE)
)
tally( ~ drink_status, data = modHELP)
# Method 2: Use .default for last level
modHELP <- mutate(HELPrct, drink_status = derivedFactor(
        abstinent = i1 == 0,
        moderate = (i1<=1 & i2<=3 & sex=='female') |
            (i1<=2 & i2<=4 & sex=='male'),
        .ordered = TRUE,
        .method = "first",
        .default = "highrisk")
)
tally( ~ drink_status, data = modHELP)
# Method 3: use TRUE to catch any fall through slots
modHELP <- mutate(HELPrct, drink_status = derivedFactor(
        abstinent = i1 == 0,
        moderate = (i1<=1 & i2<=3 & sex=='female') |
            (i1<=2 & i2<=4 & sex=='male'),
        highrisk=TRUE,
        .ordered = TRUE,
        .method = "first"
        )
)
tally( ~ drink_status, data = modHELP)
is.factor(modHELP$drink_status)
modHELP <- mutate(HELPrct, drink_status = derivedVariable(
        abstinent = i1 == 0,
        moderate = (i1<=1 & i2<=3 & sex=='female') |
            (i1<=2 & i2<=4 & sex=='male'),
        highrisk=TRUE,
        .ordered = TRUE,
        .method = "first"
    )
)
is.factor(modHELP$drink_status)
```

diffmean

Difference in means and proportions

## Description

Wrappers around $\operatorname{diff}(\operatorname{mean}(\ldots))$ and $\operatorname{diff}(\operatorname{prop}(\ldots))$ that facilitate better naming of the result

## Usage

diffmean(x, ..., data $=$ parent.frame(), only. 2 = TRUE)
diffprop(x, ..., data $=$ parent.frame(), only. $2=$ TRUE)

## Arguments

$x$, data, ... as in mosaic::mean() or mosaic: :prop()
only. 2 a logical indicating whether differences should only be computed between two groups.

## Examples

if (require(mosaicData)) \{
diffprop( homeless ~ sex , data=HELPrct)
do(3) * diffprop( homeless ~ shuffle(sex) , data=HELPrct)
diffmean( age ~ substance, data=HELPrct, only.2=FALSE)
do(3) * diffmean(age ~ shuffle(substance), data=HELPrct, only.2=FALSE)
diffmean( age ~ sex, data=HELPrct)
do(3) * diffmean(age ~ shuffle(sex), data=HELPrct)
\}
do
Do Things Repeatedly

## Description

do() provides a natural syntax for repetition tuned to assist with replication and resampling methods.

## Usage

```
    do(object, ...)
    ## S3 method for class 'numeric'
    do(object, ...)
    ## Default S3 method:
    do(object, ...)
    Do(n = 1L, cull = NULL, mode = "default", algorithm = 1, parallel = TRUE)
    ## S3 method for class 'repeater'
    print(x, ...)
    ## S4 method for signature 'repeater,ANY'
    e1 * e2
```

## Arguments

| object | an object |
| :---: | :---: |
|  | additional arguments |
| n | number of times to repeat |
| cull | function for culling output of objects being repeated. If NULL, a default culling function is used. The default culling function is currently aware of objects of types lme, lm, htest, table, cointoss, and matrix. |
| mode | target mode for value returned |
| algorithm | a number used to select the algorithm used. Currently numbers below 1 use an older algorithm and numbers $>=1$ use a newer algorithm which is faster in some situations. |
| parallel | a logical indicating whether parallel computation should be attempted using the parallel package (if it is installed and loaded). |
| x | an object created by do. |
| e1 | an object (in cases documented here, the result of running do) |
| e2 | an object (in cases documented here, an expression to be repeated) |

## Value

do returns an object of class repeater which is only useful in the context of the operator *. See the examples.

## Naming

The names used in the object returned from do() are inferred from the objects created in each replication. Roughly, this the strategy employed.

- If the objects have names, those names are inherited, if possible.
- If the objects do not have names, but do() is used with a simple function call, the name of that function is used. Example: do(3) * mean(~height, data $=$ Galton) produces a data frame with a variable named mean.
- In cases where names are not easily inferred and a single result is produced, it is named result.

To get different names, one can rename the objects as they are created, or rename the result returned from do(). Example of the former: do(3)*c(mean_height $=$ mean( $\sim$ height, data $=$ resample(Galton))).

## Note

do is a thin wrapper around Do to avoid collision with dplyr: : do() from the dplyr package.

## Author(s)

Daniel Kaplan ([kaplan@macalaster.edu](mailto:kaplan@macalaster.edu)) and Randall Pruim ([rpruim@calvin.edu](mailto:rpruim@calvin.edu))

## See Also

```
replicate(), set.rseed()
```

## Examples

```
do(3) * rnorm(1)
do(3) * "hello"
do(3) * 1:4
do(3) * mean(rnorm(25))
do(3) * lm(shuffle(height) ~ sex + mother, Galton)
do(3) * anova(lm(shuffle(height) ~ sex + mother, Galton))
do(3) * c(sample.mean = mean(rnorm(25)))
# change the names on the fly
do(3) * mean(~height, data = resample(Galton))
do(3) * c(mean_height = mean(~height, data = resample(Galton)))
set.rseed(1234)
do(3) * tally( ~sex|treat, data=resample(HELPrct))
set.rseed(1234) # re-using seed gives same results again
do(3) * tally( ~sex|treat, data=resample(HELPrct))
```

docFile Return the path to a documentation file in a package

## Description

Return the path to a documentation file in a package

## Usage

docFile(file, package = "mosaic", character.only = FALSE)

## Arguments

file the name of a file
package the name of a package
character.only a logical. If TRUE package names must be specified as character, else names will be converted as a convenience as is library() and library().

## Value

a character vector specifying the path to the file on the user's system.

```
    dotPlot Dotplots
```

## Description

A high level function and panel function for producing a variant of a histogram called a dotplot.

## Usage

```
    dotPlot(x, breaks, ..., panel = panel.dotPlot)
    panel.dotPlot(
        x,
        breaks,
        equal.widths = TRUE,
        groups = NULL,
        nint = if (is.factor(x)) nlevels(x) else round(1.3 * log2(length(x)) + 4),
        pch,
        col,
        lty = trellis.par.get("dot.line")$lty,
        lwd = trellis.par.get("dot.line")$lwd,
        col.line = trellis.par.get("dot.line")$col,
        alpha = trellis.par.get("dot.symbol")$alpha,
        cex = 1,
        type = "count",
        ...
    )
```

## Arguments

| x <br> breaks, equal. widths, groups, pch, col, lty, lwd, col.line, type, alpha <br> as in histogram() |  |
| :--- | :--- |
| $\ldots$ | additional arguments |
| panel | a panel function |
| nint | the number of intervals to use |
| cex | a ratio by which to increase or decrease the dot size |

## Value

a trellis object

## See Also

histogram()

## Examples

```
if (require(mosaicData)) {
dotPlot( ~ age, data = HELPrct)
dotPlot( ~ age, nint=42, data = HELPrct)
dotPlot( ~ height | voice.part, data = singer, nint = 17,
        endpoints = c(59.5, 76.5), layout = c(4,2), aspect = 1,
        xlab = "Height (inches)")
}
```

dpqrdist Distribution wrapper

## Description

Utility function wrapping up the $\mathrm{d} / \mathrm{p} / \mathrm{q} / \mathrm{r}$ distribution functions

## Usage

```
dpqrdist(dist, type = c("d", "p", "q", "r"), ...)
```

## Arguments

dist a character description of a distribution, for example "norm", "t", or "chisq"
type one of "x", " $p$ ", " $q$ ", or " $r$ "
... additional arguments passed on to underlying distribution function. Note that one of $d, p, q$, or $n$ must be a named argument in ...

## Examples

```
# 3 random draws from N(1,2)
dpqrdist("norm", "r", n = 3, mean = 1, sd = 2)
# These should all be the same
dpqrdist("norm", "d", x = 0) == dnorm(x = 0)
dpqrdist("norm", "p", q = 0, mean = 1, sd = 2) == pnorm(q = 0, mean = 1, sd = 2)
dpqrdist("norm", "q", p = 0.5, mean = 1, sd = 2) == qnorm(p = 0.5, mean = 1, sd = 2)
```

expandFun Expand the left-hand side of a formula

## Description

Expands the contents of functions used in a formula.

## Usage

expandFun(formula, ...)

## Arguments

| formula | A mathematical expression (see examples and plotFun()) |
| :--- | :--- |
| $\ldots$ | additional parameters |

## Value

A list with the new expanded formula and the combined formals

## Examples

$f=m a k e F u n\left(x^{\wedge} 2^{\sim} x\right)$
expandFun(f(z)~z) \#Returns $z^{\wedge} 2^{\sim} z$
factorize Conditionally convert vectors to factors

## Description

A generic function and several instances for creating factors from other sorts of data. The primary use case is for vectors that contain few unique values and might be better considered as factors. When applied to a data frame, this is applied to each variable in the data frame.

## Usage

factorize(x, ...)
\#\# Default S3 method:
factorize(x, ...)
\#\# S3 method for class 'numeric'
factorize(x, max.levels = 5L, ...)
\#\# S3 method for class 'character'
factorize(x, max.levels = 5L, ...)

```
## S3 method for class 'data.frame'
factorize(x, max.levels = 5L, ...)
factorise(x, ...)
```

## Arguments

| $x$ | an object |
| :--- | :--- |
| $\ldots$ | additional arguments (currently ignored) |
| max.levels | an integer. Only convert if the number of unique values is no more than max. levels. |

## Examples

```
data(KidsFeet, package="mosaicData")
str(KidsFeet)
factorize(KidsFeet$birthyear)
str(factorize(KidsFeet))
# alternative spelling
str(factorise(KidsFeet))
```

fav_stats Some favorite statistical summaries

## Description

Likely you mean to be using favstats(). Each of these computes the mean, standard deviation, quartiles, sample size and number of missing values for a numeric vector, but favstats() can take a formula describing how these summary statistics should be aggregated across various subsets of the data.

## Usage

fav_stats(x, ..., na.rm = TRUE, type = 7)

## Arguments

| $x$ | numeric vector |
| :--- | :--- |
| $\ldots$ | additional arguments (currently ignored) |
| na.rm | boolean indicating whether missing data should be ignored |
| type | an integer between 1 and 9 selecting one of the nine quantile algorithms detailed <br> in the documentation for stats: : quantile() |

## Value

A vector of statistical summaries

## Examples

fav_stats(1:10)
fav_stats(faithful\$eruptions)
favstats(Sepal.Length ~ Species, data=iris) \# Note: this is favstats() rather than fav_stats()
fetchData Defunct functions now in the fetch package

## Description

These functions have been moved to the fetch package.

## Usage

fetchData(...)
fetchGapminder1(...)
fetchGapminder(...)
fetchGoogle(...)

## Arguments

$\ldots \quad$ arguments
findZeros Find zeros of functions

## Description

Compute numerically zeros of a function or simultaneous zeros of multiple functions.

## Usage

```
findZeros(
    expr,
    ...,
    xlim = c(near - within, near + within),
    near = 0,
    within = Inf,
    nearest = 10,
    npts = 1000,
    iterate = 1,
    sortBy = c("byx", "byy", "radial")
```

```
)
## S3 method for class 'formula'
solve(
    form,
    ...,
    near = 0,
    within = Inf,
    nearest = 10,
    npts = 1000,
    iterate = 1,
    sortBy = c("byx", "byy", "radial")
)
```

## Arguments

expr A formula. The right side names the variable with respect to which the zeros should be found. The left side is an expression, e.g. $\sin (x) \sim x$. All free variables (all but the variable on the right side) named in the expression must be assigned a value via ...
... Formulas corresponding to additional functions to use in simultaneous zero finding and/or specific numerical values for the free variables in the expression.
xlim The range of the dependent variable to search for zeros. Inf is a legitimate value, but is interpreted in the numerical sense as the non-Inf largest floating point number. This can also be specified replacing $x$ with the name of the variable. See the examples.
near a value near which zeros are desired
within only look for zeros at least this close to near. near and within provide an alternative to using $x$ lim to specify the search space.
nearest the number of nearest zeros to return. Fewer are returned if fewer are found.
npts How many sub-intervals to divide the xlim into when looking for candidates for zeros. The default is usually good enough. If Inf is involved, the intervals are logarithmically spaced up to the largest finite floating point number. There is no guarantee that all the roots will be found.
iterate maximum number of times to iterate the search. Subsequent searches take place with the range of previously found zeros. Choosing a large number here is likely to kill performance without improving results, but a value of 1 (the default) or 2 works well when searching in $\mathrm{c}(-\mathrm{Inf}, \mathrm{Inf})$ for a modest number of zeros near near.
sortBy specifies how the zeros found will be sorted. Options are 'byx', 'byy', or 'radial'.
form Expression to be solved

## Details

Searches numerically using uniroot.
Uses findZerosMult of findZeros to solve the given expression

## Value

A dataframe of zero or more numerical values. Plugging these into the expression on the left side of the formula should result in values near zero.
a dataframe with solutions to the expression.

## Author(s)

Daniel Kaplan ([kaplan@macalester.edu](mailto:kaplan@macalester.edu))
Cecylia Bocovich

## Examples

```
findZeros( sin(t) ~ t, xlim=c(-10,10) )
# Can use tlim or t.lim instead of xlim if we prefer
findZeros( sin(t) ~ t, tlim=c(-10,10) )
findZeros( sin(theta) ~ theta, near=0, nearest=20)
findZeros(A*sin(2*pi*t/P) ~ t, xlim=c(0,100), P=50, A=2)
# Interval of a normal at half its maximum height.
findZeros( dnorm(x,mean=0,sd=10) - 0.5*dnorm(0,mean=0,sd=10) ~ x )
# A pathological example
# There are no "neareset" zeros for this function. Each iteration finds new zeros.
f <- function(x) { if (x==0) 0 else sin(1/x) }
findZeros( f(x) ~ x, near=0 )
# Better to look nearer to 0
findZeros( f(x) ~ x, near=0, within=100 )
findZeros( f(x) ~ x, near=0, within=100, iterate=0 )
findZeros( f(x) ~ x, near=0, within=100, iterate=3 )
# Zeros in multiple dimensions (not run: these take a long time)
# findZeros( (x^2+y^2+\mp@subsup{z}{}{\wedge}2-5~x&y&z, nearest=3000, within = 5)
# findZeros(x*y+z^2~z&y&z, z+y~x&y&z, npts=10)
solve(3*x==3~x)
# plot out sphere (not run)
# sphere = solve(x^2+y^2+z^2==5~x&y&z, within=5, nearest=1000)
# cloud(z~x+y, data=sphere)
```

## Description

Compute numerically zeros of a function of two or more variables. All free variables (all but the variable on the right side) named in the expression must be assigned a value via ...

## Usage

findZerosMult(..., npts = 10, rad = 5, near = 0, sortBy = "byx")

## Arguments

| $\ldots$. | arguments for values NOTE: if the system has more than one equation and the <br> rhs variables do not match up, there will be an error. |
| :--- | :--- |
| npts | number of desired zeros to return |
| rad | radius around near in which to look for zeros |
| near | center of search for zeros |
| sortBy | options for sorting zeros for plotting. Options are 'byx', 'byy' and 'radial'. The <br> default value is 'byx'. |

## Details

sorts points in the domain according to the sign of the function value at respective points. Use continuity and uniroot to find zeros between points of opposite signs. Returns any number of points which may be sorted and plotted according to $\mathrm{x}, \mathrm{y}$, or radial values.

## Value

A data frame of numerical values which should all result in a value of zero when input into original function

## Author(s)

Cecylia Bocovich

## Examples

```
findZerosMult(a*x^2-8~a&x, npts = 50)
findZerosMult(a^2+x^2-8~a&x, npts = 100, sortBy='radial')
## Not run: findZerosMult(a^2+\mp@subsup{x}{}{\wedge}2-8~a&x, npts = 1000, sortBy='radial')
```

## Description

Allows you to specify a formula with parameters, along with starting guesses for the parameters. Refines those guesses to find the least-squares fit.

## Usage

fitModel(formula, data = parent.frame(), start = list(), ...)
model(object, ...)
\#\# S3 method for class 'nlsfunction'
model(object, ...)

```
## S3 method for class 'nlsfunction'
summary(object, ...)
## S3 method for class 'nlsfunction'
coef(object, ...)
```

## Arguments

| formula | formula specifying the model |
| :--- | :--- |
| data | dataframe containing the data to be used |
| start | passed as start to $n l s()$. If and empty list, a simple starting point is used (thus <br> avoiding the usual warning message). |
| $\ldots$ | additional arguments passed to nls() |
| object | an R object (typically a the result of fitModel) |

## Details

Fits a nonlinear least squares model to data. In contrast to linear models, all the parameters (including linear ones) need to be named in the formula. The function returned simply contains the formula together with pre-assigned arguments setting the parameter value. Variables used in the fitting (as opposed to parameters) are unassigned arguments to the returned function.

## Value

a function

## Note

This doesn't work with categorical explanatory variables. Also, this does not work with synthetic data that fit the model perfectly. See link\{nls\} for details.

## See Also

linearModel(), nls()

## Examples

```
if (require(mosaicData)) {
f <- fitModel(temp ~ A+B*exp(-k*time), data=CoolingWater, start=list(A=50,B=50,k=1/20))
f(time=50)
coef(f)
summary(f)
model(f)
}
```

fitSpline Fit splines to data

## Description

These functions create mathematical functions from data, using splines.

## Usage

fitSpline(
formula,
data = parent.frame(),
df = NULL,
knots $=$ NULL,
degree $=3$,
type = c("natural", "linear", "cubic", "polynomial"),
)

## Arguments

| formula | a formula. Only one quantity is allowed on the left-hand side, the output quantity |
| :--- | :--- |
| data | a data frame in which formula is evaluated. |
| df | degrees of freedom (used to determine how many knots should be used) <br> knots <br> a vector of knots |
| type | parameter for splines when type is "polynomial". 1 is locally linear, 2 is lo- <br> cally quadratic, etc. <br> type of splines to use; one of "linear", "cubic", "natural" (cubic with linear <br> tails, the default), or "polynomial". |
| $\ldots$ | additional arguments passed to spline basis functions (ns() and bs()). |

## Value

a function of the explanatory variable

## See Also

bs() and ns() for the bases used to generate the splines.

## Examples

```
f <- fitSpline( weight ~ height, data=women, df=5 )
xyplot( weight ~ height, data=women )
plotFun(f(height) ~ height, add=TRUE)
g <- fitSpline( length ~ width, data = KidsFeet, type='natural', df=5 )
```

```
    h <- fitSpline( length ~ width, data = KidsFeet, type='linear', df=5 )
    xyplot( length ~ width, data = KidsFeet, col='gray70', pch=16)
    plotFun(g, add=TRUE, col='navy')
    plotFun(h, add=TRUE, col='red')
```

fortify.hclust mosaic tools for clustering

## Description

mosaic tools for clustering

## Usage

```
## S3 method for class 'hclust'
fortify(
    model,
    data,
    which = c("segments", "heatmap", "leaves", "labels", "data"),
    k = 1,
    )
    ## S3 method for class 'hclust'
    mplot(
        object,
        data,
        colorize = TRUE,
        k = 1,
        labels = FALSE,
        heatmap = 0,
        enumerate = "white",
    ...
    )
```

## Arguments

| model | a model |
| :--- | :--- |
| data | a data-like object |
| which | which kind of fortification to compute |
| k | number of clusters |
| $\ldots$ | additional arguments passed on to link\{dendro_data\} |
| object | an object of class "hclust" |
| colorize | whether to show clusters in different colors |
| labels | a logical indicating whether labels should be used to identify leaves of the tree. |

| heatmap | the ratio of size of heatmap to size of dendrogram. Use 0 or FALSE to omit the |
| :--- | :--- |
| heatmap. |  |
| enumerate | a color used for numbers within heatmap. Use "transparent" to hide. |

## Examples

```
KidsFeet %>% select(-name, -birthmonth) %>% rescale() -> KidsFeet2
    M <- dist(KidsFeet2)
    Cl <- hclust(M)
    fortify(Cl, k=5) %>% head(3)
    fortify(Cl, which="heatmap", data=KidsFeet2) %>% head(3)
    fortify(Cl, which="data", data=KidsFeet2) %>% head(3)
    fortify(Cl, which="labels") %>% head(3)
    mplot(Cl, data=KidsFeet2, k=4, heatmap=2)
    mplot(Cl, data=KidsFeet2, k=4, heatmap=0.5, enumerate="transparent")
    mplot(Cl, data=KidsFeet2, k=4, heatmap=2, type="triangle")
    mplot(Cl, data=KidsFeet2, k=4, heatmap=0, type="triangle")
```

fortify.summary.lm Extract data from R objects

## Description

Extract data from R objects

## Usage

```
## S3 method for class 'summary.lm'
    fortify(model, data = NULL, level = 0.95, ...)
    ## S3 method for class 'summary.glm'
    fortify(model, data = NULL, level = 0.95, ...)
    ## S3 method for class 'TukeyHSD'
    fortify(model, data, order = c("asis", "pval", "difference"), ...)
```

## Arguments

model
an R object
data original data set, if needed
level confidence level
... additional arguments
order one of "pval", "diff", or "asis" determining the order of the pair factor, which determines the order in which the differences are displayed on the plot.

## Description

## Turn histograms into frequency polygons

## Usage

```
freqpoly(x, plot = TRUE, ...)
hist2freqpolygon(hist)
## S3 method for class 'freqpolygon'
plot(
        x,
        freq = equidist,
        col = graphics::par("fg"),
        lty = NULL,
        lwd = 1,
        main = paste("Frequency polygon of", paste(x$xname, collapse = "\n")),
        sub = NULL,
        xlab = x$xname,
        ylab,
        xlim = range(x$x),
        ylim = NULL,
        axes = TRUE,
        labels = FALSE,
        add = FALSE,
        ann = TRUE,
        ...
    )
```

## Arguments

x
plot
. . .
hist

## freq

col A color for the frequency polygon.
lty An integer indicating the line type.
lwd An integer indicating the line width.
main
a logical indicating if a plot should be generated.
additional arguments passed on to hist().
a histogram object produced by link\{hist\}().

A title for the plot.
a vector of values for which a frequency polygon is desired.

A logical indicating whether the vertical scale should be frequency (count).

| sub | A sub-title for the plot. |
| :--- | :--- |
| xlab | Label for the horizontal axis. |
| ylab | Label for the vertical axis. |
| xlim | A numeric vector of length 2. |
| ylim | A numeric vector of length 2. |
| axes | A logical indicating whether axes should be drawn. |
| labels | A logical indicating whether labels should be printed or a character vector of |
| add | labels to add. |
| ann | A logical indicating whether the plot should be added to the current plot |

## Value

An object of class "freqpoly" (invisibly). Additionally, if plot is TRUE, a plot is generated.

## Examples

freqpoly(faithful\$eruptions)
bks <- c $(0,1,1.5,2,3,3.5,4,4.5,5,7)$
hist(faithful\$eruptions, breaks = bks)
freqpoly(faithful\$eruptions, col $=\operatorname{rgb}(0,0,1, .5), \operatorname{lwd}=5$, breaks $=b k s, a d d=\operatorname{TRUE}$ )
freqpolygon Frequency Polygons

## Description

Frequency polygons are an alternative to histograms that make it simpler to overlay multiple distributions.

## Usage

freqpolygon(
x ,
...,
panel = "panel.freqpolygon",
prepanel = "prepanel.default.freqpolygon"
)
prepanel.default.freqpolygon(
x ,
darg = list(),
plot. points = FALSE, ref = FALSE,

```
    groups = NULL,
    subscripts = TRUE,
    jitter.amount = 0.01 * diff(current.panel.limits()$ylim),
    center = NULL,
    nint = NULL,
    breaks = NULL,
    width = darg$width,
    type = "density",
    ...
)
panel.freqpolygon(
    x,
    darg = list(),
    plot.points = FALSE,
    ref = FALSE,
    groups = NULL,
    weights = NULL,
    jitter.amount = 0.01 * diff(current.panel.limits()$ylim),
    type = "density",
    breaks = NULL,
    nint = NULL,
    center = NULL,
    width = darg$width,
    gcol = trellis.par.get("reference.line")$col,
    glwd = trellis.par.get("reference.line")$lwd,
    h,
    v,
    ...,
    identifier = "freqpoly"
)
```

## Arguments

x
... additional arguments passed on to histogram() and panel.
panel a panel function
prepanel a prepanel function
darg a list of arguments for the function computing the frequency polygon. This exists primarily for compatibility with densityplot and is unlikely to be needed by the end user.
plot.points one of TRUE, FALSE, "jitter", or "rug" indicating how points are to be displayed
ref a logical indicating whether a horizontal reference line should be added (roughly equivalent to $h=0$ )
groups, weights, jitter.amount, identifier as in densityplot() or histogram()

| subscripts | as in other lattice prepanel functions |
| :--- | :--- |
| center | center of one of the bins |
| nint | an approximate number of bins for the frequency polygon |
| breaks | a vector of breaks for the frequency polygon bins |
| width | width of the bins |
| type | one of 'density ', 'percent ', or 'count' |
| gcol | color of guidelines |
| glwd | width of guidelines |
| h, v | a vector of values for additional horizontal and vertical lines |

## Value

a trellis object

## Note

This function make use of histogram to determine overall layout. Often this works reasonably well but sometimes it does not. In particular, when groups is used to overlay multiple frequency polygons, there is often too little head room. In the latter cases, it may be necessary to use ylim to determine an appropriate viewing rectangle for the plot.

## Examples

```
freqpolygon(~age | substance, data=HELPrct, v=35)
freqpolygon(~age, data=HELPrct, labels=TRUE, type='count')
freqpolygon(~age | substance, data=HELPrct, groups=sex)
freqpolygon(~age | substance, data=HELPrct, groups=sex, ylim=c(0,0.11))
## comparison of histogram and frequency polygon
histogram(~eruptions, faithful, type='density', width=.5)
ladd( panel.freqpolygon(faithful$eruptions, width=.5 ))
```

FunctionsFromData Create function from data

## Description

These functions create mathematical functions from data, by smoothing, splining, or linear combination (fitting). Each of them takes a formula and a data frame as an argument

## Usage

spliner(formula, data $=$ NULL, method $=" f m m "$, monotonic $=$ FALSE)
connector(formula, data $=$ NULL, method = "linear")
smoother(formula, data, span $=0.5$, degree $=2, \ldots$ )
linearModel(formula, data, ...)

## Arguments

formula a formula. Only one quantity is allowed on the left-hand side, the output quantity

## data a data frame

method a method for splining. See spline().
monotonic a TRUE/FALSE flag specifying whether the spline should respect monotonicity in the data
span parameter to smoother. How smooth it should be.
degree parameter to smoother. 1 is locally linear, 2 is locally quadratic.
... additional arguments to stats: : loess() or stats::1m()

## Details

These functions use data to create a mathematical, single-valued function of the inputs. All return a function whose arguments are the variables used on the right-hand side of the formula. If the formula involves a transformation, e.g. sqrt(age) or $\log$ (income), only the variable itself, e.g. age or income, is an argument to the function.
linearModel takes a linear combination of the vectors specified on the right-hand side. It differs from project in that linearModel returns a function whereas project returns the coefficients. NOTE: An intercept term is not included unless that is explicitly part of the formula with +1 . This conflicts with the standard usage of formulas as found in lm. Another option for creating such functions is to combine $\operatorname{lm}()$ and makeFun().
spliner and connector currently work for only one input variable.

## See Also

project() method for formulas

## Examples

```
if (require(mosaicData)) {
data(CPS85)
f <- smoother(wage ~ age, span=.9, data=CPS85)
f(40)
g <- linearModel(log(wage) ~ age + educ + 1, data=CPS85)
g(age=40, educ=12)
# an alternative way to define g (Note: + 1 is the default for lm().)
g2 <- makeFun(lm(log(wage) ~ age + educ, data=CPS85))
g2(age=40, educ=12)
x<-1:5; y=c(1, 2, 4, 8, 8.2)
f1 <- spliner(y ~ x)
f1(x=8:10)
f2 <- connector(x~y)
}
```

## getVarFormula Extract data from a data frame using a formula interface

## Description

Uses the full model syntax.

## Usage

getVarFormula(formula, data $=$ parent.frame(), intercept $=$ FALSE)

## Arguments

| formula | a formula. The right-hand side selects variables; the left-hand side, if present, is <br> used to set row names. A . on the right-hand side indicates to use all variables <br> not in the LHS. |
| :--- | :--- |
| data | a data frame |
| intercept | a logical indicating whether to include the intercept in the model default: FALSE <br> (no intercept) |

## Examples

```
    getVarFormula( ~ wt + mpg, data = mtcars)
```

    googleMap \(\quad\) Display a point on earth on a Google Map
    
## Description

Creates a URL for Google Maps for a particular latitude and longitude position. This function has been deprecated due to changes in Google's access policies. Give leaflet_map() a try as an alternative.

## Usage

```
googleMap(
    latitude,
    longitude,
    position = NULL,
    zoom = 12,
    maptype = c("roadmap", "satellite", "terrain", "hybrid"),
    mark = FALSE,
    radius = 0,
    browse = TRUE,
)
```

## Arguments

latitude, longitude vectors of latitude and longitude values
position a data frame containing latitude and longitude positions
zoom zoom level for initial map (1-20)
maptype one of 'roadmap', 'satellite', 'terrain', and 'hybrid'
mark a logical indicating whether the location should be marked with a pin
radius a vector of radii of circles centered at position that are displayed on the map
browse a logical indicating whether the URL should be browsed (else only returned as a string)
... additional arguments passed to browseURL

## Value

a string containing a URL. Optionally, as a side-effect, the URL is visited in a browser

## See Also

leaflet_map(), deg2rad(), latlon2xyz() and rgeo().

## Examples

```
## Not run:
googleMap(40.7566, -73.9863, radius=1) # Times Square
googleMap(position=rgeo(2), radius=1) # 2 random locations
## End(Not run)
```

inferArgs Infer arguments

## Description

The primary purpose is for inferring argument settings from names derived from variables occurring in a formula. For example, the default use is to infer limits for variables without having to call them xlim and ylim when the variables in the formula have other names. Other uses could easily be devised by specifying different variants.

## Usage

inferArgs(
vars,
dots,
defaults = alist(xlim = , ylim = , zlim = ),
variants = c(".lim", "lim")
)

## Arguments

| vars | a vector of variable names to look for |
| :--- | :--- |
| dots | a named list of argument values |
| defaults | named list or alist of default values for limits |
| variants | a vector of optional postfixes for limit-specifying variable names |

## Value

a named list or alist of limits. The names are determined by the names in defaults.
If multiple variants are matched, the first is used.

## Examples

```
inferArgs(c('x','u','t'), list(t=c(1,3), x.lim=c(1,10), u=c(1,3), u.lim=c(2,4)))
inferArgs(c('x','u'), list(u=c(1,3)), defaults=list(xlim=c(0,1), ylim=NULL))
```

is.wholenumber Check for whole number values

## Description

Unlike is.integer (), which checks the type of argument is integer, this function checks whether the value of the argument is an integer (within a specified tolerance).

## Usage

is.wholenumber (x, tol = .Machine\$double.eps^0.5)

## Arguments

x
a vector
tol a numeric tolerance

## Details

This function is borrowed from the examples for is.integer()

## Value

a logical vector indicating whether x has a whole number value

## Examples

```
is.wholenumber(1)
all(is.wholenumber(rbinom(100,10,.5)))
is.wholenumber((1:10)/2)
```

ladd Add to Lattice Plots

## Description

Simplified lattice plotting by adding additional elements to existing plots.

## Usage

$\operatorname{ladd}(x$, data $=$ NULL, $\ldots$, plot $=$ trellis.last. object())

## Arguments

x
data
...
plot
callable graphical element to be added to a panel or panels in a lattice plot
a list containing objects that can be referred to in $x$. Panel functions also have access to the data already used in the panel by the underlying lattice plot. See latticeExtra: :layer() for details.
additional arguments passed to latticeExtra: :layer().
a lattice plot to add to. Defaults to previous lattice plot.

## Details

ladd is a wrapper around latticeExtra: : layer() that simplifies certain common plotting additions. The same caveats that apply to that function apply here as well. In particular, ladd uses non-standard evaluation. For this reason care must be taken if trying to use ladd within other functions and the use of data may be required to pass information into the environment in which x will be evaluated.

## Value

a trellis object

## Author(s)

Randall Pruim ([rpruim@calvin.edu](mailto:rpruim@calvin.edu))

## See Also

latticeExtra::layer()

## Examples

```
p <- xyplot(rnorm(100) ~rnorm(100))
print(p)
ladd(panel.abline(a=0,b=1))
ladd(panel.abline(h=0,col='blue'))
ladd(grid.text('Hello'))
ladd(grid.text(x=.95,y=.05,'text here',just=c('right','bottom')))
```

```
q <- xyplot(rnorm(100) ~rnorm(100)|factor(rbinom(100,4,.5)))
q <- update(q, layout=c(3,2))
ladd(panel.abline(a=0,b=1), plot=q)
ladd(panel.abline(h=0, col='blue'))
ladd( grid.text("(2,1)",gp=gpar(cex=3,alpha=.5)), columns=2, rows=1)
ladd( grid.text("p5",gp=gpar(cex=3,alpha=.5)), packets=5)
q
ladd( grid.text(paste(current.column(), current.row(),sep=','), gp=gpar(cex=3,alpha=.5)))
histogram( ~eruptions, data=faithful )
# over would probably be better here, but the demonstrates what under=TRUE does.
ladd(panel.densityplot(faithful$eruptions, lwd=4), under=TRUE)
```

leaflet_map Simple Leaflet Maps

## Description

Primarily designed to work with rgeo() to display randomly sampled points on the globe.

```
Usage
    leaflet_map(
        latitude = NULL,
        longitude = NULL,
        position = NULL,
        zoom = 12,
        mark = FALSE,
        radius = 0,
        units = c("km", "miles", "meters", "feet"),
    )
```

## Arguments

latitude, longitude
vectors of latitude and longitude values. If latitude is a data frame, then it is treated as position. This facilitates "piping" from rgeo(). See examples.
position a data frame containing latitude and longitude positions
zoom zoom level for initial map (1-20)
mark a logical indicating whether the location should be marked with a pin
radius a vector of radii of circles (in miles) centered at position that are displayed on the map
units units for radii of circles (km, miles, meters, or feet).
... additional arguments passed to leaflet::addCircles()

## Value

a leaflet map

## See Also

$\operatorname{deg} 2 \operatorname{rad}()$, latlon2xyz() and rgeo().

## Examples

```
# Times Square
leaflet_map(40.7566, -73.9863, radius = 1, units = "miles")
# 3 random locations; 5 km circles
leaflet_map(position = rgeo(3), radius = 5, mark = TRUE, color = "red")
# using pipes
rgeo(4, latlim = c(25,50), lonlim = c(-65, -125)) %>%
    leaflet_map(radius = 5, mark = TRUE, color = "purple")
```

linear.algebra Functions for teaching linear algebra.

## Description

These functions provide a formula based interface to the construction of matrices from data and for fitting. You can use them both for numerical vectors and for functions of variables in data frames. These functions are intended to support teaching basic linear algebra with a particular connection to statistics.

## Usage

mat(formula, data $=$ parent.frame(), A = formula)
singvals(formula, data = parent.frame(), $A=$ formula)

## Arguments

| formula | a formula. In mat and singvals, only the right-hand side is used. |
| :--- | :--- |
| data | a data frame from which to pull out numerical values for the variables in the <br> formula |
| A | an alias for formula for backward compatibility. <br> mat returns a model matrix |
|  | To demonstrate singularity, use singvals. |

## Value

mat returns a matrix
singvals gives singular values for each column in the model matrix

## See Also

project()
linearModel(), which returns a function.

## Examples

```
a <- c(1,0,0); b <- c(1,2,3); c <- c(4,5,6); x <- rnorm(3)
# Formula interface
mat(~a+b)
mat(~a+b+1)
if (require(mosaicData)) {
mat(~length+sex, data=KidsFeet)
singvals(~length*sex*width, data=KidsFeet)
}
```

MAD All pairs mean and sum of absolute differences

## Description

The functions compute the sum or mean of all pairwise absolute differences. This differs from stats: :mad(), which computes the median absolute difference of each value from the median of all the values. See the ISIwithR package (and the textbook it accompanies) for examples using these functions in the context of simulation-based inference.

## Usage

```
MAD(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
SAD(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
```

## Arguments

| $x$ | a numeric vector or a formula. |
| :--- | :--- |
| $\ldots$ | additional arguments passed through to $M A D_{-}$or $S A D_{-}$. If $x$ is a formula, $\ldots$ <br> should include an argument named data if the intent is to interpret the formula <br> in a data frame. |
| data | a data frame in which to evaluate formulas (or bare names). Note that the default <br> is data = parent. frame (). This makes it convenient to use this function inter- <br> actively by treating the working environment as if it were a data frame. But this <br> may not be appropriate for programming uses. When programming, it is best to <br> use an explicit data argument - ideally supplying a data frame that contains the <br> variables mentioned. |
| groups | a grouping variable, typically a name of a variable in data <br> na.rm logical indicating whether NAs should be removed before calculating. |

## Value

the mean or sum of the absolute differences between each pair of values in $c(x, \ldots)$.

## See Also

$$
\operatorname{mad}(), M A D \_()
$$

## Examples

```
SAD(1:3)
MAD (1:3)
MAD(~eruptions, data = faithful)
```

$$
\mathrm{MAD}_{-} \quad \text { All pairs mean and sum of absolute differences }
$$

## Description

All pairs mean and sum of absolute differences

## Usage

MAD_(x, ..., na.rm = getOption("na.omit", FALSE))
SAD_(x, ..., na.rm = getOption("na.omit", FALSE))

## Arguments

x
a numeric vector or a formula.
. . additional arguments appended to $x$
na.rm a logical indicating whether NAs should be removed before calculating.

## Value

the mean or sum of the absolute differences between each pair of values in $c(x, \ldots)$.

## See Also

$\operatorname{mad}()$

```
maggregate Aggregate for mosaic
```

## Description

Compute function on subsets of a variable in a data frame.

## Usage

```
maggregate(
    formula,
    data = parent.frame(),
    FUN,
    groups = NULL,
    subset,
    drop = FALSE,
    ...,
    .format = c("default", "table", "flat"),
    .overall = mosaic.par.get("aggregate.overall"),
    .multiple = FALSE,
    .name = deparse(substitute(FUN)),
    .envir = parent.frame()
)
```

## Arguments

| formula | a formula. Left side provides variable to be summarized. Right side and condition describe subsets. If the left side is empty, right side and condition are shifted over as a convenience. |
| :---: | :---: |
| data | a data frame. Note that the default is data=parent.frame(). This makes it convenient to use this function interactively by treating the working environment as if it were a data frame. But this may not be appropriate for programming uses. When programming, it is best to use an explicit data argument - ideally supplying a data frame that contains the variables mentioned in formula. |
| FUN | a function to apply to each subset |
| groups | grouping variable that will be folded into the formula (if there is room for it). This offers some additional flexibility in how formulas can be specified. |
| subset | a logical indicating a subset of data to be processed. |
| drop | a logical indicating whether unused levels should be dropped. |
|  | additional arguments passed to FUN |
| .format | format used for aggregation. "default" and "flat" are equivalent. |
| . overall | currently unused |
| .multiple | a logical indicating whether FUN returns multiple values Ignored if .multiple is not NULL. |
| . name | a name used for the resulting object |
| .envir | an environment in which to evaluate expressions |

## Value

a vector

## Examples

```
if (require(mosaicData)) {
maggregate( cesd ~ sex, HELPrct, FUN=mean )
# using groups instead
maggregate( ~ cesd, groups = sex, HELPrct, FUN=sd )
# the next four all do the same thing
maggregate( cesd ~ sex + homeless, HELPrct, FUN=mean )
maggregate( cesd ~ sex | homeless, HELPrct, FUN=sd )
maggregate( ~ cesd | sex , groups= homeless, HELPrct, FUN=sd )
maggregate( cesd ~ sex, groups = homeless, HELPrct, FUN=sd )
# this is unusual, but also works.
maggregate( cesd ~ NULL , groups = sex, HELPrct, FUN=sd )
}
```

makeColorscheme Create a color generating function from a vector of colors

## Description

Create a color generating function from a vector of colors

## Usage

makeColorscheme(col)

## Arguments

col
a vector of colors

## Value

a function that generates a vector of colors interpolated among the colors in col

## Examples

```
cs <- makeColorscheme( c('red','white','blue') )
cs(10)
cs(10, alpha=.5)
```

```
makeMap Make a map with ggplot2
```

## Description

makeMap takes in two sources of data that refer to geographical regions and merges them together. Depending on the arguments passed, it returns this merged data or a ggplot object constructed with the data.

## Usage

```
makeMap(
    data = NULL,
    map = NULL,
    key = c(key.data, key.map),
    key.data,
    key.map,
    tr.data = identity,
    tr.map = identity,
    plot = c("borders", "frame", "none")
)
```

## Arguments

data A dataframe with regions as cases
map An object that can be fortified to a dataframe (ex: a dataframe itself, or a SpatialPolygonsDataFrame)
key.data
key.map
tr.data
tr.map
plot
key The combination of key.data and key.map
The column name in the data that holds the unique names of each region
The column name in the map that holds the unique names of each region
A function of the transformation to be performed to the key.data column
A function of the transformation to be performed to the key.map column
The plot desired for the output. plot $=$ "none" returns the merged data that is the result of merging the data and map together; plot="frame" returns an empty (unplottable) ggplot object; plot = "border" (the default) returns a ggplot object with one geom_polygon layer that shows the borders of the regions.

## mean_ Aggregating functions

## Description

The mosaic package makes several summary statistic functions (like mean and sd) formula aware.

## Usage

```
mean_(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
mean(x, ...)
median(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
range(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
sd(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
max(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
min(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
sum(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
IQR(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
fivenum(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
iqr(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
prod(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
sum(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
favstats(x, ..., data = NULL, groups = NULL, na.rm = TRUE)
quantile(x, ..., data = NULL, groups = NULL, na.rm = getOption("na.rm", FALSE))
var(x, y = NULL, na.rm = getOption("na.rm", FALSE), ..., data = NULL)
cor(x, y = NULL, ..., data = NULL)
cov(x, y = NULL, ..., data = NULL)
```

## Arguments

a numeric vector or a formula

| $\ldots$. | additional arguments |
| :--- | :--- |
| data | a data frame in which to evaluate formulas (or bare names). Note that the default <br> is data = parent. frame(). This makes it convenient to use this function inter- <br> actively by treating the working environment as if it were a data frame. But this <br> may not be appropriate for programming uses. When programming, it is best to <br> use an explicit data argument - ideally supplying a data frame that contains the <br> variables mentioned. |
| groups | a grouping variable, typically a name of a variable in data <br> na.rm |
| y a logical indicating whether NAs should be removed before computing |  |$\quad$| a numeric vector or a formula |
| :--- |

## Details

Many of these functions mask core R functions to provide an additional formula interface. Old behavior should be unchanged. But if the first argument is a formula, that formula, together with data are used to generate the numeric vector(s) to be summarized. Formulas of the shape $x \sim$ a or $\sim x \mid$ a can be used to produce summaries of $x$ for each subset defined by a. Two-way aggregation can be achieved using formulas of the form $x \sim a+b$ or $x \sim a \mid b$. See the examples.

Note
Earlier versions of these functions supported a "bare name + data frame" interface. This functionality has been removed since it was (a) ambiguous in some cases, (b) unnecessary, and (c) difficult to maintain.

## Examples

```
mean(HELPrct$age)
mean( ~ age, data = HELPrct)
mean( ~ drugrisk, na.rm = TRUE, data = HELPrct)
mean(age ~ shuffle(sex), data = HELPrct)
mean(age ~ shuffle(sex), data = HELPrct, .format = "table")
# wrap in data.frame() to auto-convert awkward variable names
data.frame(mean(age ~ shuffle(sex), data = HELPrct, .format = "table"))
mean(age ~ sex + substance, data = HELPrct)
mean( ~ age | sex + substance, data = HELPrct)
mean( ~ sqrt(age), data = HELPrct)
sum( ~ age, data = HELPrct)
sd(HELPrct$age)
sd( ~ age, data = HELPrct)
sd(age ~ sex + substance, data = HELPrct)
var(HELPrct$age)
var( ~ age, data = HELPrct)
var(age ~ sex + substance, data = HELPrct)
IQR(width ~ sex, data = KidsFeet)
iqr(width ~ sex, data = KidsFeet)
favstats(width ~ sex, data = KidsFeet)
cor(length ~ width, data = KidsFeet)
cov(length ~ width, data = KidsFeet)
```

```
tally(is.na(mcs) ~ is.na(pcs), data = HELPmiss)
cov(mcs ~ pcs, data = HELPmiss) # NA because of missing data
cov(mcs ~ pcs, data = HELPmiss, use = "complete") # ignore missing data
# alternative approach using filter explicitly
cov(mcs ~ pcs, data = HELPmiss %>% filter(!is.na(mcs) & !is.na(pcs)))
```

    mid midpoints along a sequence
    
## Description

Compute a vector of midpoints between values in a numeric vector

## Usage

$\operatorname{mid}(x)$

## Arguments

x
a numeric vector

## Value

a vector of length 1 less than $x$

## Examples

```
mid(1:5)
    mid((1:5)^2)
```

mosaic.options Setting options for mosaic package functions

## Description

A mechanism for setting options in the mosaic package.

## Usage

mosaic.options(...)
mosaic.getOption(name)
mosaic.par.set(name, value, .... theme, warn = TRUE, strict = FALSE)
mosaic.par.get(name = NULL)

```
restoreLatticeOptions()
mosaicLatticeOptions()
```

## Arguments

| $\ldots$. | additional arguments that are turned into a list if a list cannot be inferred from <br> theme, name, and value. |
| :--- | :--- |
| name | the name of the option being set |
| value | the value to which to set the option |
| theme | a list appropriate for a mosaic theme |
| warn | a logical. UNUSED at present. |
| strict | a logical or numeric. |

## Details

restoreLatticeOptions returns any lattice options that were changed when the mosaic package was loaded back to their pre-mosaic state.
mosaicLatticeOptions sets a number of defaults for lattice graphics.

```
mPlot Interactive plotting
```

## Description

These functions provide a menu selection system (via manipulate) so that different aspects of a plot can be selected interactively. The ggplot2 or lattice command for generating the plot currently being displayed can be copied to the console, whence it can be copied to a document for later direct, non-interactive use.

## Usage

```
    mPlot(
    data,
    format,
    default = format,
    system = system_choices()[1],
    show = FALSE,
    title = "",
    data_text = rlang::expr_text(data),
    )
    mMap(
    data,
```

```
    default = "map",
    system = "ggplot2",
    show = FALSE,
    title = title,
    data_text = rlang::expr_text(data),
)
mScatter(
    data,
    default = c("scatter", "jitter", "boxplot", "violin", "line"),
    system = "ggformula",
    show = FALSE,
    title = "",
    data_text = rlang::expr_text(data)
)
mUniplot(
    data,
    default = c("histogram", "density", "frequency polygon", "ASH plot"),
    system = system_choices()[1],
    show = FALSE,
    title = "",
    data_text = rlang::expr_text(data)
)
```

## Arguments

\(\left.$$
\begin{array}{ll}\text { data } & \begin{array}{l}\text { a data frame containing the variables that might be used in the plot. Note that } \\
\text { for maps, the data frame must contain coordinates of the polygons comprising } \\
\text { the map and a variable for determining which coordinates are part of the same } \\
\text { region. See sp2df() for one way to create such a data frame. Typically merge() } \\
\text { will be used to combine the map data with some auxiliary data to be displayed } \\
\text { as fill color on the map, although this is not necessary if all one wants is a map. }\end{array} \\
\text { format } & \begin{array}{l}\text { a synonym for default. } \\
\text { default }\end{array}
$$ <br>
default type of plot to create; one of "scatter", "jitter", "boxplot", "violin", <br>
"histogram", "density", "frequency polygon", "xyplot", or "map". Unique <br>

prefixes suffice.\end{array}\right]\)| which graphics system to use (initially) for plotting (ggplot2 or lattice). A check |
| :--- |
| box will allow on the fly change of plotting system. |

## Details

Only mPlot is required by end users. The other plotting functions are dispatched based on the value of default. Furthermore, mplot () will dispatch mPlot when provided a data frame.
Currently maps are only supported in ggplot2 and not in lattice.

## Value

Nothing. Just for side effects.

## Examples

```
## Not run:
mPlot(HELPrct, format = "scatter")
mPlot(HELPrct, format = "density")
## End(Not run)
```

mplot Generic plotting

## Description

Generic function plotting for R objects. Currently plots exist for data.frames, lms, (including glms).

## Usage

```
mplot(object, ...)
## Default S3 method:
mplot(object, ...)
    ## S3 method for class 'lm'
    mplot(
        object,
        which = c(1:3, 7),
        system = c("ggplot2", "lattice", "base"),
        ask = FALSE,
        multiplot = "package:gridExtra" %in% search(),
        par.settings = theme.mosaic(),
        level = 0.95,
        title = paste("model: ", deparse(object$call), "\n"),
        rows = TRUE,
        id.n = 3L,
        id.size = 5,
        id.color = "red",
        id.nudge = 1,
```

```
    add.smooth = TRUE,
    smooth.color = "red",
    smooth.alpha = 0.6,
    smooth.size = 0.7,
    span = 3/4,
)
## S3 method for class 'data.frame'
mplot(
    object,
    format,
    default = format,
    system = c("ggformula", "ggplot2", "lattice"),
    show = FALSE,
    title = "",
)
## S3 method for class 'summary.lm'
mplot(
        object,
        system = c("ggplot2", "lattice"),
        level = 0.95,
        par.settings = trellis.par.get(),
        rows = TRUE,
)
## S3 method for class 'TukeyHSD'
mplot(
        object,
        system = c("ggplot2", "lattice"),
        ylab = "",
        xlab = "difference in means",
        title = paste0(attr(object, "conf.level") * 100, "% family-wise confidence level"),
        par.settings = trellis.par.get(),
        order = c("asis", "pval", "difference"),
)
```

## Arguments

object an R object from which a plot will be constructed.
... additional arguments. If object is an lm, subsets of these arguments are passed to grid.arrange and to the lattice plotting routines; in particular, nrow and ncol can be used to control the number of rows and columns used.
which a numeric vector used to select from 7 potential plots

| system | which graphics system to use (initially) for plotting (ggplot2 or lattice). A check box will allow on the fly change of plotting system. |
| :---: | :---: |
| ask | if TRUE, each plot will be displayed separately after the user responds to a prompt. |
| multiplot | if TRUE and ask == FALSE, all plots will be displayed together. |
| par.settings | lattice theme settings |
| level | a confidence level |
| title | title for plot |
| rows | rows to show. This may be a numeric vector, TRUE (for all rows), or a character vector of row names. |
| id.n | Number of id labels to display. |
| id.size | Size of id labels. |
| id.color | Color of id labels. |
| id.nudge | a numeric used to increase $(>1)$ or decrease $(<1)$ the amount that observation labels are nudged. Use a negative value to nudge down instead of up. |
| add.smooth | A logicial indicating whether a LOESS smooth should be added (where this makes sense to do). Currently ignored for lattice plots. |
| smooth.color, smooth.size, smooth.alpha |  |
|  | Color, size, and alpha used for LOESS curve. Currently ignored for lattice plots. |
| span | A positive number indicating the amount of smoothing. A larger number indicates more smoothing. See stats: :loess() for details. Currently ignored for lattice plots. |
| format, default |  |
|  | default type of plot to create; one of "scatter", "jitter", "boxplot", "violin", "histogram", "density", "frequency polygon", or "map". Unique prefixes suffice. |
| show | a logical, if TRUE, the code will be displayed each time the plot is changed. |
| ylab | label for y -axis |
| xlab | label for x -axis |
| order | one of "pval", "diff", or "asis" determining the order of the pair factor, which determines the order in which the differences are displayed on the plot. |
| data | a data frame containing the variables that might be used in the plot. |

## Details

The method for models ( lm and glm) is still a work in progress, but should be usable for relatively simple models. When the results for a logistic regression model created with glm() are satisfactory will depend on the format and structure of the data used to fit the model.

## Value

Nothing. Just for side effects.

## Examples

```
lm( width ~ length * sex, data = KidsFeet) \%>\%
        mplot(which = 1:3, id.n = 5)
    \(\operatorname{lm}(\) width \(\sim\) length \(*\) sex, data \(=\) KidsFeet) \(\%>\%\)
        mplot(smooth.color = "blue", smooth.size \(=1.2\), smooth.alpha \(=0.3\), id.size \(=3\) )
    lm(width ~ length * sex, data = KidsFeet) \%>\%
        mplot(rows \(=2: 3\), which \(=7\) )
    \#\# Not run:
    mplot ( HELPrct)
    mplot( HELPrct, "histogram" )
    \#\# End(Not run)
    lm(width ~ length * sex, data \(=\) KidsFeet) \%>\%
        summary() \%>\%
        mplot()
    lm(width ~ length * sex, data = KidsFeet) \%>\%
        summary() \%>\%
        mplot(rows = c("sex", "length"))
    lm(width ~ length * sex, data \(=\) KidsFeet) \%>\%
        summary() \%>\%
        mplot(rows = TRUE)
    lm(age \(\sim\) substance, data \(=\) HELPrct) \(\%>\%\)
        TukeyHSD() \%>\%
        mplot()
    lm(age ~ substance, data \(=\) HELPrct) \(\%>\%\)
        TukeyHSD() \%>\%
        mplot(system = "lattice")
```

    mUSMap \(\quad\) Make a US map with ggplot2
    
## Description

mUSMap takes in one dataframe that includes information about different US states. It merges this dataframe with a dataframe that includes geographical coordinate information. Depending on the arguments passed, it returns this data or a ggplot object constructed with the data.

## Usage

```
mUSMap(
    data = NULL,
    key,
    fill = NULL,
    plot = c("borders", "frame", "none"),
    style = c("compact", "real")
)
```

## Arguments

$$
\begin{array}{ll}
\text { data } & \text { A dataframe with US states as cases } \\
\text { key } & \text { The column name in the data that holds the unique names of each state } \\
\text { fill } & \begin{array}{l}
\text { A variable in the data used to specify the fill color of states in the map (note: if } \\
\text { fill is not null, then plot cannot be set to "none") }
\end{array} \\
\text { plot } & \begin{array}{l}
\text { The plot desired for the output. plot = "none" returns the merged data that is the } \\
\text { result of merging the data and the dataframe with the geographical coordinate } \\
\text { information; plot = "frame" returns an empty (unplottable) ggplot object; plot } \\
=\text { "border" (the default) returns a ggplot object with one geom_polygon layer } \\
\text { that shows the borders of the states }
\end{array} \\
\text { style } & \begin{array}{l}
\text { The style in which to display the map. compact gives a polyconic projection } \\
\text { with Alaska and Hawaii on the lower left corner; real gives the real size and } \\
\text { position of all states without any projection. }
\end{array}
\end{array}
$$

## Examples

USArrests2 <- USArrests \%\% mutate(state = row.names(.))
mUSMap(USArrests2, key="state", fill = "UrbanPop")

```
mWorldMap Make a world map with ggplot2
```

## Description

mWorldMap takes in one dataframe that includes information about different countries. It merges this dataframe with a dataframe that includes geographical coordinate information. Depending on the arguments passed, it returns this data or a ggplot object constructed with the data.

## Usage

```
    mWorldMap(
        data \(=\) NULL,
        key = NA,
        fill = NULL,
        plot = c("borders", "frame", "none")
    )
```

## Arguments

data A dataframe with countries as cases
key The column name in the data that holds the unique names of each country
fill A variable in the data used to specify the fill color of countries in the map (note: if fill is not null, then plot cannot be set to "none")

#### Abstract

plot The plot desired for the output. plot = "none" returns the merged data that is the result of merging the data and the dataframe with the geographical coordinate information; plot $=$ "frame" returns an empty (unplottable) ggplot object; plot = "border" (the default) returns a ggplot object with one geom_polygon layer that shows the borders of the countries

## Examples

```
## Not run:
gdpData <- CIAdata("GDP") # load some world data
mWorldMap(gdpData, key="country", fill="GDP")
gdpData <- gdpData %>% mutate(GDP5 = ntiles(-GDP, 5, format="rank"))
mWorldMap(gdpData, key="country", fill="GDP5")
mWorldMap(gdpData, key="country", plot="frame") +
geom_point()
mergedData <- mWorldMap(gdpData, key="country", plot="none")
ggplot(mergedData, aes(x=long, y=lat, group=group, order=order)) +
geom_polygon(aes(fill=GDP5), color="gray70", size=.5) + guides(fill=FALSE)
## End(Not run)
```

```
ntiles Create vector based on roughly equally sized groups
```

## Description

Create vector based on roughly equally sized groups

## Usage

```
    ntiles(
        x,
        n = 3,
        format = c("rank", "interval", "mean", "median", "center", "left", "right"),
        digits = 3
    )
```

## Arguments

x
n
format
digits
a numeric vector
(approximate) number of quantiles
a specification of desired output format.
desired number of digits for labeling of factors.

## Value

a vector. The type of vector will depend on format.

## Examples

```
if (require(mosaicData)) {
tally( ~ ntiles(age, 4), data=HELPrct)
tally( ~ ntiles(age, 4, format="center"), data=HELPrct)
tally( ~ ntiles(age, 4, format="interval"), data=HELPrct)
tally( ~ ntiles(age, 4, format="left"), data=HELPrct)
tally( ~ ntiles(age, 4, format="right"), data=HELPrct)
tally( ~ ntiles(age, 4, format="mean"), data=HELPrct)
tally( ~ ntiles(age, 4, format="median"), data=HELPrct)
bwplot( i2 ~ ntiles(age, n=5, format="interval"), data=HELPrct)
}
```

orrr

Odds Ratio and Relative Risk for $2 \times 2$ Contingency Tables

## Description

This function calculates the odds ratio and relative risk for a $2 \times 2$ contingency table and a confidence interval (default conf. level is 95 percent) for the each estimate. $x$ should be a matrix, data frame or table. "Successes" should be located in column 1 of $x$, and the treatment of interest should be located in row 2. The odds ratio is calculated as (Odds row 2) / (Odds row 1). The confidence interval is calculated from the $\log (\mathrm{OR})$ and backtransformed.

## Usage

```
    orrr(
        x,
        conf.level = 0.95,
        verbose = !quiet,
        quiet = TRUE,
        digits = 3,
        relrisk = FALSE
    )
    oddsRatio(x, conf.level = 0.95, verbose = !quiet, quiet = TRUE, digits = 3)
    relrisk(x, conf.level = 0.95, verbose = !quiet, quiet = TRUE, digits = 3)
    ## S3 method for class 'oddsRatio'
    print(x, digits = 4, ...)
    ## S3 method for class 'relrisk'
    print(x, digits = 4, ...)
```

```
## S3 method for class 'oddsRatio'
summary(object, digits = 4, ...)
## S3 method for class 'relrisk'
summary(object, digits = 4, ...)
```

## Arguments

x
a $2 \times 2$ matrix, data frame, or table of counts
conf.level
verbose a logical indicating whether verbose output should be displayed
quiet a logical indicating whether verbose output should be suppressed
digits number of digits to display
relrisk a logical indicating whether the relative risk should be returned instead of the odds ratio
... additional arguments
object an R object to print or summarise. Here an object of class "oddsRatio" or "relrisk".

## Value

an odds ratio or relative risk. If verpose is true, more details and the confidence intervals are displayed.

## Author(s)

Kevin Middleton (<kmm@csusb. edu>); modified by R Pruim.

relrisk(tally(~ homeless + sex, data = HELPrct) )
do(3) * relrisk( tally( ~ homeless + shuffle(sex), data = HELPrct) )
}
```

```
panel.levelcontourplot
```

    Lattice plot that draws a filled contour plot
    
## Description

Used within plotFun

## Usage

```
panel.levelcontourplot(
        x,
        y,
        z,
        subscripts = 1,
        at,
        shrink,
        labels = TRUE,
        label.style = c("mixed", "flat", "align"),
        contour = FALSE,
        region = TRUE,
        col = add.line$col,
        lty = add.line$lty,
        lwd = add.line$lwd,
        border = "transparent",
        ...,
        col.regions = regions$col,
        filled = TRUE,
        alpha.regions = regions$alpha
    )
```

## Arguments

| $x$ | $x$ on a grid |
| :--- | :--- |
| $y$ | $y$ on a grid |
| $z$ | zvalues for the $x$ and $y$ |
| subscripts | which points to plot |
| at | cuts for the contours |
| shrink | what does this do? |
| labels | draw the contour labels |
| label.style | where to put the labels |
| contour | logical draw the contours |
| region | logical color the regions |
| col | color for contours |

| lty | type for contours |
| :--- | :--- |
| lwd | width for contour |
| border | type of border |
| $\ldots$ | dots additional arguments |
| col.regions | a vector of colors or a function (topo.colors by default) for generating such |
| filled | whether to fill the contours with color |
| alpha.regions | transparency of regions |

## Description

show confidence and prediction bands on plots

## Usage

panel.lmbands(
x ,
$y$,
interval = "confidence",
level = 0.95,
model $=\operatorname{lm}(y \sim x)$,
band.col $=c($ conf $=$ slcol[3], pred $=$ slcol[2]),
band.lty $=c(c o n f=$ slty[3], pred $=$ slty[2]),
band. show = TRUE,
fit.show = TRUE,
band.alpha $=0.6$,
band. $1 \mathrm{wd}=1$,
npts $=100$,
)

## Arguments

| $\mathrm{x}, \mathrm{y}$ | numeric vectors |
| :--- | :--- |
| interval | a vector subset of 'confidence' and 'prediction' |
| level | confidence level |
| model | model to be used for generating bands |
| band.col | a vector of length 1 or 2 giving the color of bands |
| band.lty | a vector of length 1 or 2 giving the line type for bands <br> band. show |
| logical vector of length 1 or 2 indicating whether confidence and prediction <br> bands should be shown |  |

| fit.show | logical indicating whether the model fit should be shown |
| :--- | :--- |
| band.alpha | a vector of length 1 or 2 alpha level for bands |
| band. lwd | a vector of length 1 or 2 giving line width for bands |
| npts | resolution parameter for bands (increase to get better resolution) |
| $\ldots$ | additional arguments |

## panel.plotFun Panel function for plotting functions

## Description

Panel function for plotting functions

## Usage

panel.plotFun( object,
...,
type = "l",
npts $=$ NULL,
zlab = NULL, filled = TRUE, levels = NULL, nlevels = 10, surface = FALSE, col.regions = topo.colors, lwd = trellis.par.get("superpose.line")\$lwd, lty = trellis.par.get("superpose.line")\$lty, alpha = NULL, discontinuity = NULL, discontinuities $=$ NULL
)

## Arguments

| object | an object (e.g., a formula) describing a function |
| :---: | :---: |
|  | additional arguments, typically processed by lattice panel functions such as lattice:: panel.xyplot() or lattice::panel.levelplot(). Frequently used arguments include |
|  | lwd line width |
|  | lty line type |
|  | col a color |
| type | type of plot ("l" by default) |
| npts | an integer giving the number of points (in each dimension) to sample the function |

## See Also

plotFun

## Examples

```
x <- runif(30,0,2*pi)
d <- data.frame( x = x, y = sin(x) + rnorm(30,sd=.2) )
xyplot( y ~ x, data=d )
ladd(panel.plotFun( sin(x) ~ x, col='red' ) )
xyplot( y ~ x | rbinom(30,1,.5), data=d )
ladd(panel.plotFun( sin(x) ~ x, col='red', lty=2 ) ) # plots sin(x) in each panel
```

```
panel.plotFun1
```

Panel function for plotting functions

## Description

Panel function for plotting functions

## Usage

panel.plotFun1(
..f..,
...,
x ,
$y$,
type = "l",

```
    lwd = trellis.par.get("superpose.line")$lwd,
    lty = trellis.par.get("superpose.line")$lty,
    col = trellis.par.get("superpose.line")$col,
    npts = NULL,
    zlab = NULL,
    filled = TRUE,
    levels = NULL,
    nlevels = 10,
    surface = FALSE,
    alpha = NULL,
    discontinuity = NULL,
    discontinuities = NULL
)
```

## Arguments

| . .f. . | an object (e.g., a formula) describing a function |
| :---: | :---: |
|  | additional arguments, typically processed by lattice panel functions such as lattice:: panel.xyplot() or lattice::panel.levelplot(). Frequently used arguments include |
|  | lwd line width |
|  | lty line type |
|  | col a color |
| $x, y$ | ignored, but there for compatibility with other lattice panel functions |
| type | type of plot ("l" by default) |
| lwd | width of the line |
| lty | line type |
| col | a vector of colors |
| npts | an integer giving the number of points (in each dimension) to sample the function |
| zlab | label for z axis (when in surface-plot mode) |
| filled | fill with color between the contours (TRUE by default) |
| levels | levels at which to draw contours |
| nlevels | number of contours to draw (if levels not specified) |
| surface | a logical indicating whether to draw a surface plot rather than a contour plot |
| alpha | number from 0 (transparent) to 1 (opaque) for the fill colors |
| discontinuity | a positive number determining how sensitive the plot is to potential discontinuity. Larger values result in less sensitivity. The default is 1 . Use discontinuity $=$ Inf to disable discontinuity detection. Discontinuity detection uses a crude numerical heuristic and may not give the desired results in all cases. |
| discontinuitie |  |
|  | a vector of input values at which a function is discontinuous or NULL to use a heuristic to auto-detect. |

    xyplot( y ~ x, data=d )
    ladd(panel.plotFun1( sin, col='red' ) )
    xyplot( y ~ x | rbinom(30,1,.5), data=d )
    ladd(panel.plotFun1( sin, col='red', lty=2 ) ) # plots sin(x) in each panel
```

    pdist Illustrated probability calculations from distributions
    
## Description

Illustrated probability calculations from distributions

## Usage

pdist
dist = "norm",
q,
plot $=$ TRUE,
verbose = FALSE,
invisible = FALSE,
digits = 3L,
xlim,
ylim,
resolution = 500L,
return = c("values", "plot"),
...,
refinements = list()
)
xpgamma(
q ,
shape,
rate $=1$,
scale = $1 /$ rate,
lower.tail = TRUE,
log.p = FALSE,
)
$\operatorname{xpt}(q, d f, n c p$, lower.tail $=$ TRUE, log.p $=$ FALSE,...$)$

```
xpchisq(q, df, ncp = 0, lower.tail = TRUE, log.p = FALSE, ...)
xpf(q, df1, df2, lower.tail = TRUE, log.p = FALSE, ...)
xpbinom(q, size, prob, lower.tail = TRUE, log.p = FALSE, ...)
xppois(q, lambda, lower.tail = TRUE, log.p = FALSE, ...)
xpgeom(q, prob, lower.tail = TRUE, log.p = FALSE, ...)
xpnbinom(q, size, prob, mu, lower.tail = TRUE, log.p = FALSE, ...)
xpbeta(q, shape1, shape2, ncp = 0, lower.tail = TRUE, log.p = FALSE, ...)
```

## Arguments

| dist | a character description of a distribution, for example "norm", "t", or "chisq" |
| :---: | :---: |
| q | a vector of quantiles |
| plot | a logical indicating whether a plot should be created |
| verbose | a logical |
| invisible | a logical |
| digits | the number of digits desired |
| xlim | x limits |
| ylim | y limits |
| resolution | Number of points used for detecting discreteness and generating plots. The default value of 5000 should work well except for discrete distributions that have many distinct values, especially if these values are not evenly spaced. |
| return | If "plot", return a plot. If "values", return a vector of numerical values. |
|  | Additional arguments, typically for fine tuning the plot. |
| refinements | A list of refinements to the plot. See ggformula: :gf_refine(). |
| shape | shape and scale parameters. Must be positive, scale strictly. |
| rate | an alternative way to specify the scale. |
| scale | shape and scale parameters. Must be positive, scale strictly. |
| lower.tail | logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X>x]$. |
| log.p | logical; if TRUE, probabilities/densities $p$ are returned as $\log (p)$. |
| df | degrees of freedom ( $>0$, maybe non-integer). $\mathrm{df}=\mathrm{Inf}$ is allowed. |
| ncp | non-centrality parameter $\delta$; currently except for $\mathrm{rt}($ ), only for $\mathrm{abs}(\mathrm{ncp})<=$ 37.62. If omitted, use the central $t$ distribution. |
| df1 | degrees of freedom. Inf is allowed. |
| df2 | degrees of freedom. Inf is allowed. |
| size | number of trials (zero or more). |

| prob | probability of success on each trial. |
| :--- | :--- |
| lambda | vector of (non-negative) means. |
| mu | alternative parametrization via mean: see 'Details'. |
| shape1 | non-negative parameters of the Beta distribution. |
| shape2 | non-negative parameters of the Beta distribution. |

## Details

The most general function is pdist which can work with any distribution for which a p-function exists. As a convenience, wrappers are provided for several common distributions.

## Value

A vector of probabilities; a plot is printed as a side effect.

## See Also

```
qdist(), xpnorm(), xqnorm().
```

## Examples

```
pdist("norm", -2:2)
pdist("norm", seq(80,120, by = 10), mean = 100, sd = 10)
pdist("chisq", 2:4, df = 3)
pdist("f", 1, df1 = 2, df2 = 10)
pdist("gamma", 2, shape = 3, rate = 4)
```

```
plotCumfreq Cumulative frequency plots
```

## Description

A high-level function for producing a cumulative frequency plot using lattice graphics.

## Usage

```
plotCumfreq(x, data, ...)
```

\#\# S3 method for class 'formula'
plotCumfreq(x, data $=$ NULL, subscripts, ...)
\#\# Default S3 method:
plotCumfreq(x, ...)
prepanel.cumfreq(x, ...)
panel.cumfreq(x, type = c("smooth", "step"), groups = NULL, ...)

## Arguments

| x | a formula or numeric vector |
| :--- | :--- |
| data | a data frame in which x is evaluated if x is a formula. |
| $\ldots$ | other lattice arguments |
| subscripts | as in lattice plots |
| type | smooth or step-function? |
| groups | grouping variable |

## See Also

histogram(), densityplot()

## Examples

```
plotCumfreq(~eruptions, faithful, xlab = 'duration of eruptions')
```

plotDist

Plots of Discrete and Continuous Distributions

## Description

Provides a simple way to generate plots of pdfs, probability mass functions, cdfs, probability histograms, and normal-quantile plots for distributions known to R .

## Usage

```
plotDist(
        dist,
    ...,
    xlim = NULL,
    ylim = NULL,
    add,
    under = FALSE,
    packets = NULL,
    rows = NULL,
    columns = NULL,
    kind = c("density", "cdf", "qq", "histogram"),
    xlab = "",
    ylab = "",
    breaks = NULL,
    type,
    resolution = 5000L,
    params = NULL
)
```

## Arguments

| dist | A string identifying the distribution. This should work with any distribution that has associated functions beginning with 'd', 'p', and 'q' (e.g, dnorm(), pnorm(), and qnorm()). dist should match the name of the distribution with the initial 'd', 'p', or 'q' removed. |
| :---: | :---: |
|  | other arguments passed along to lattice graphing routines |
| $x \mathrm{lim}$ | a numeric vector of length 2 or NULL, in which case the central 99.8 of the distribution is used. |
| ylim | a numeric vector of length 2 or NULL, in which case a heuristic is used to avoid chasing asymptotes in distributions like the F distributions with 1 numerator degree of freedom. |
| add | a logical indicating whether the plot should be added to the previous lattice plot. If missing, it will be set to match under. |
| under | a logical indicating whether adding should be done in a layer under or over the existing layers when add $=$ TRUE. |
| packets, row | columns <br> specification of which panels will be added to when add is TRUE. See latticeExtra: :layer(). |
| kind | one of "density", "cdf", "qq", or "histogram" (or prefix of any of these) |
| xlab, ylab | as per other lattice functions |
| breaks | a vector of break points for bins of histograms, as in histogram() |
| type | passed along to various lattice graphing functions |
| resolution | number of points to sample when generating the plots |
| params | a list containing parameters for the distribution. If NULL (the default), this list is created from elements of ... that are either unnamed or have names among the formals of the appropriate distribution function. See the examples. |

## Details

plotDist() determines whether the distribution is continuous or discrete by seeing if all the sampled quantiles are unique. A discrete random variable with many possible values could fool this algorithm and be considered continuous.
The plots are done referencing a data frame with variables $x$ and $y$ giving points on the graph of the pdf, pmf, or cdf for the distribution. This can be useful in conjunction with the groups argument. See the examples.

plotDist( "norm", mean=m[2], sd=s[2], col="blue", under=TRUE, packets=2)
}
```

plotFun Plotting mathematical expressions

## Description

Plots mathematical expressions in one and two variables.

## Usage

```
plotFun(
    object,
    ...,
    plot = trellis.last.object(),
    add = NULL,
    under = FALSE,
    xlim = NULL,
    ylim = NULL,
    npts = NULL,
    ylab = NULL,
    xlab = NULL,
    zlab = NULL,
    filled = TRUE,
```

```
    levels = NULL,
    nlevels = 10,
    labels = TRUE,
    surface = FALSE,
    groups = NULL,
    col = trellis.par.get("superpose.line")$col,
    col.regions = topo.colors,
    type = "l",
    lwd = trellis.par.get("superpose.line")$lwd,
    lty = trellis.par.get("superpose.line")$lty,
    alpha = NULL,
    discontinuities = NULL,
    discontinuity = 1,
    interactive = rstudio_is_available()
)
```

## Arguments

object
plot a trellis object; by default, the most recently created trellis plot. When add is TRUE, the new function will be plotted into a layer added to this object.
add if TRUE, then add a layer to an existing plot rather than creating a new plot. If NULL, this will be determined by the value of under.
under if TRUE, then new layer is added beneath existing layers
$x \lim \quad$ limits for x axis (or use variable names, see examples)
ylim limits for y axis (or use variable names, see examples)
npts number of points for plotting.
ylab label for $y$ axis
$x l a b \quad$ label for x axis
zlab label for z axis (when in surface-plot mode)
filled fill with color between the contours (TRUE by default)

| levels | levels at which to draw contours |
| :--- | :--- |
| nlevels | number of contours to draw (if levels not specified) |
| labels | if FALSE, don't label contours |
| surface | draw a surface plot rather than a contour plot |
| groups | grouping argument ala lattice graphics |
| col | vector of colors for line graphs and contours |
| col.regions | a vector of colors or a function (topo. colors by default) for generating such <br> type |
| type of plot ("l" by default) |  |
| lty | vector of line widths for line graphs |
| alpha |  |
| discontinuities |  |$\quad$| number from 0 (transparent) to 1 (opaque) for the fill colors |
| :--- |

## Details

makes plots of mathematical expressions using the formula syntax. Will draw both line plots and contour/surface plots (for functions of two variables). In RStudio, the surface plot comes with sliders to set orientation. If the colors in filled surface plots are too blocky, increase npts beyond the default of 50 , though npts=300 is as much as you're likely to ever need. See examples for overplotting a constraint function on an objective function.

## Value

a trellis object

## Examples

```
plotFun( a*sin(x^2)~x, xlim=range(-5,5), a=2 ) # setting parameter value
plotFun( u^2 ~ u, ulim=c(-4,4) ) # limits in terms of u
# Note roles of ylim and y.lim in this example
plotFun( y^2 ~ y, ylim=c(-2,20), y.lim=c(-4,4) )
# Combining plot elements to show the solution to an inequality
plotFun( x^2 -3 ~ x, xlim=c(-4,4), grid=TRUE )
ladd( panel.abline(h=0,v=0,col='gray50') )
plotFun( (x^2 -3) * (x^2 > 3) ~ x, type='h', alpha=.1, lwd=4, col='lightblue', add=TRUE )
plotFun( sin(x) ~ x,
    groups=cut(x, findZeros(sin(x) ~ x, within=10)$x),
    col=c('blue','green'), lty=2, lwd=3, xlim=c(-10,10) )
plotFun( sin(x) ~ x,
```

```
        groups=cut(x, findZeros(sin(x) ~ x, within=10)$x),
        col=c(1,2), lty=2, lwd=3, xlim=c(-10,10) )
    ## plotFun( sin(2*pi*x/P)*exp(-k*t)~x+t, k=2, P=.3)
    f <- rfun( ~ u & v )
    plotFun( f(u=u,v=v) ~ u & v, u.lim=range(-3,3), v.lim=range(-3,3) )
    plotFun( u^2 + v < 3 ~ u & v, add=TRUE, npts=200 )
    if (require(mosaicData)) {

    fitted.length <- makeFun(mod)
    xyplot(length ~ width, groups=sex, data=KidsFeet, auto.key=TRUE)
    plotFun(fitted.length(width, sex="B") ~ width, add=TRUE, col=1)
    plotFun(fitted.length(width, sex="G") ~ width, add=TRUE, col=2)
```

    plotModel Plot a regression model
    
## Description

Visualize a regression model amid the data that generated it.

## Usage

plotModel(mod, ...)

## Arguments

$\bmod \quad$ A model of type $\operatorname{lm}()$ or $g \operatorname{lm}()$
... arguments passed to xyplot() or rgl::plot3d.

## Details

The goal of this function is to assist with visualization of statistical models. Namely, to plot the model on top of the data from which the model was fit.

The primary plot type is a scatter plot. The x -axis can be assigned to one of the predictors in the model. Additional predictors are thought of as co-variates. The data and fitted curves are partitioned by these covariates. When the number of components to this partition is large, a random subset of the fitted curves is displayed to avoid visual clutter.

If the model was fit on one quantitative variable (e.g. SLR), then a scatter plot is drawn, and the model is realized as parallel or non-parallel lines, depending on whether interaction terms are present.
Eventually we hope to support 3-d visualizations of models with 2 quantitative predictors using the rgl package.

Currently, only linear regression models and generalized linear regression models are supported.

## Value

A lattice or ggplot2 graphics object.

## Caution

This is still underdevelopment. The API is subject to change, and some use cases may not work yet. Watch for improvements in subsequent versions of the package.

plotPoints Scatter plot of points

## Description

Make or add a scatter plot in a manner coordinated with plotFun.

## Usage

```
plotPoints(
    x,
    data = parent.frame(),
    add = NULL,
    under = FALSE,
    panelfun = panel.xyplot,
    plotfun = xyplot,
    plot = trellis.last.object()
)
```

## Arguments

## x

A formula specifying $y \sim x$ or $z \sim x \& y$

| data | Data frame containing the variables to be plotted. If not specified, the variables <br> will be looked up in the local environment |
| :--- | :--- |
| add | If TRUE, add points as a new layer to an existing plot. If NULL, the value of under <br> will be used. |
| under | If TRUE, the new layer will be underneath existing layers. |
| panelfun | Lattice panel function to be used for adding. Set only if you want something <br> other than a scatter plot. Mainly, this is intended to add new functionality <br> through other functions. |
| plotfun | Lattice function to be used for initial plot creation. Set only if you want some- <br> thing other than a scatter plot. Mainly, this is intended to add new functionality <br> through other functions. |
| plot | additional arguments |
|  | a trellis plot, by default the most recently created one. If add is TRUE, new points <br> will be added as a new layer to plot. |

## Value

A trellis graphics object

## See Also

plotFun()
```

## Examples

```
if (require(mosaicData)) {
plotPoints( width ~ length, data=KidsFeet, groups=sex, pch=20)
f <- makeFun( lm( width ~ length * sex, data=KidsFeet))
plotFun( f(length=length, sex="G")~length, add=TRUE, col="pink")
plotFun( f(length=length,sex="B")~length, add=TRUE)
}
```

project
Projections

## Description

Compute projections onto the span of a vector or a model space, dot products, and vector lengths in Euclidean space.

## Usage

```
project(x, ...)
\#\# S4 method for signature 'formula'
project(x, u = NULL, data = parent.frame(2), coefficients = TRUE, ...)
    \#\# S4 method for signature 'numeric'
    project (x, u \(=\) rep(1, length(x)), type \(=c(" v e c t o r ", " l e n g t h ", ~ " c o e f "), \ldots)\)
    \#\# S4 method for signature 'matrix'
    project(x, u, data = parent.frame())
    vlength(x, ...)
    \(\operatorname{dot}(u, v)\)
```

## Arguments

x
... additional arguments
u a numeric vector
data a data frame.
v
coefficients For project $(y \sim x)$ indicates whether the projection coefficents should be returned or the projection vector.
type one of "length" or "vector" determining the type of the returned value
a numeric vector (all functions) or a formula (only for project). Left-hand sides of formulas should be a single quantity a numeric vector

## Details

project (preferably pronounced "pro-JECT" as in "projection") does either of two related things: (1) Given two vectors as arguments, it will project the first onto the second, returning the point in the subspace of the second that is as close as possible to the first vector. (2) Given a formula as an argument, will work very much like 1 m() , constructing a model matrix from the right-hand side of the formula and projecting the vector on the left-hand side onto the subspace of that model matrix.
In (2), rather than returning the projected vector, project() returns the coefficients on each of the vectors in the model matrix. UNLIKE $\operatorname{lm}()$, the intercept vector is NOT included by default. If you want an intercept vector, include +1 in your formula.

## Value

project returns the projection of x onto u (or its length if u and v are numeric vectors and type $==$ "length")
vlength returns the length of the vector (i.e., the square root of the sum of the squares of the components)
dot returns the dot product of $u$ and $v$

## See Also

link\{project $\}$

## Examples

```
x1 <- c(1,0,0); x2 <- c(1,2,3); y1 <- c(3,4,5); y2 <- rnorm(3)
# projection onto the 1 vector gives the mean vector
mean(y2)
project(y2, 1)
# return the length of the vector, rather than the vector itself
project(y2, 1, type='length')
project(y1 ~ x1 + x2) -> pr; pr
# recover the projected vector
cbind(x1,x2) %*% pr -> v; v
project( y1 ~ x1 + x2, coefficients=FALSE )
dot( y1 - v, v ) # left over should be orthogonal to projection, so this should be ~ 0
if (require(mosaicData)) {
project(width~length+sex, data=KidsFeet)
}
vlength(rep(1,4))
if (require(mosaicData)) {
m <- lm( length ~ width, data=KidsFeet )
# These should be the same
vlength( m$effects )
vlength( KidsFeet$length)
# So should these
vlength( tail(m$effects, -2) )
sqrt(sum(resid(m)^2))
}
v<-c(1,1,1); w <- c(1,2,3)
u <- v / vlength(v) # make a unit vector
# The following should be the same:
project(w,v, type="coef") * v
project(w,v)
# The following are equivalent
abs(dot( w, u ))
vlength( project( w, u) )
vlength( project( w, v) )
project( w, v, type='length' )
```

## Description

The mosaic prop. test provides wrapper functions around the function of the same name in stats. These wrappers provide an extended interface (including formulas). prop.test performs an approximate test of a simple null hypothesis about the probability of success in a Bernoulli or multinomial experiment from summarized data or from raw data.

## Usage

```
    prop.test(
        x,
        n ,
        p = NULL,
        alternative = c("two.sided", "less", "greater"),
        conf.level = 0.95,
        data \(=\) NULL,
        success = NULL,
        ...
    )
```

## Arguments

$x \quad$ count of successes, length 2 vector of success and failure counts, a formula, or a character, numeric, or factor vector containing raw data.
$\mathrm{n} \quad$ sample size (successes + failures) or a data frame (for the formula interface)
$p \quad a$ vector of probabilities of success. The length of $p$ must be the same as the number of groups specified by $x$, and its elements must be greater than 0 and less than 1.
alternative character string specifying the alternative hypothesis, must be one of "two.sided" (default), "greater" or "less". You can specify just the initial letter. Only used for testing the null that a single proportion equals a given value, or that two proportions are equal; ignored otherwise.
conf.level confidence level of the returned confidence interval. Must be a single number between 0 and 1 . Only used when testing the null that a single proportion equals a given value, or that two proportions are equal; ignored otherwise.
data a data frame (if missing, n may be a data frame)
success level of variable to be considered success. All other levels are considered failure.
... additional arguments (often ignored). When x is a formula, groups can be used to compare groups: $\mathrm{x}=\sim$ var, groups $=\mathrm{g}$ is equivalent to $\mathrm{x}=\mathrm{var} \sim \mathrm{g}$. na. rm can be a logical or an integer vector of length 1 or 2 to indicate dimension along which NA's are removed before coputing the test. See the examples.

## Details

$$
\text { conf.level }=0.95, \ldots \text { ) }
$$

This is a wrapper around prop. test() to simplify its use when the raw data are available, in which case an extended syntax for prop. test is provided.

## Value

an htest object

## Note

When $x$ is a $0-1$ vector, 0 is treated as failure and 1 as success. Similarly, for a logical vector TRUE is treated as success and FALSE as failure.

## See Also

```
mosaic::binom.test(), stats::prop.test()
```

## Examples

```
# Several ways to get a confidence interval for the proportion of Old Faithful
# eruptions lasting more than 3 minutes.
prop.test( faithful$eruptions > 3 )
prop.test(97,272)
faithful$long <- faithful$eruptions > 3
prop.test( faithful$long )
prop.test( ~long , data = faithful )
prop.test( homeless ~ sex, data = HELPrct )
prop.test( ~ homeless | sex, data = HELPrct )
prop.test( ~ homeless, groups = sex, data = HELPrct )
prop.test(anysub ~ link, data = HELPrct, na.rm = TRUE)
prop.test(link ~ anysub, data = HELPrct, na.rm = 1)
prop.test(link ~ anysub, data = HELPrct, na.rm = TRUE)
```

```
prop_test Internal function for testing proportion
```

## Description

This function is wrapped by prop. test(), which most users should use instead.

## Usage

prop_test(
x ,
n ,
$\mathrm{p}=\mathrm{NULL}$,
alternative = c("two.sided", "less", "greater"), conf.level = 0.95,
)

## Arguments

x
n
$p \quad a$ vector of probabilities of success (for the null hypothesis). The length must be the same as the number of groups specified by $x$.
alternative a character string specifying the alternative hypothesis, must be one of "two.sided" (default), "greater" or "less". You can specify just the initial letter. Only used for testing the null that a single proportion equals a given value, or that two proportions are equal; ignored otherwise.
conf.level confidence level of the returned confidence interval. Must be a single number between 0 and 1 . Only used when testing the null that a single proportion equals a given value, or that two proportions are equal; ignored otherwise.
... additional arguments passed to methods.

## Description

Density, distribution function, quantile function, and random generation from data.

## Usage

```
qdata(formula, p = seq(0, 1, 0.25), data = NULL, ...)
    cdata(formula, p = 0.95, data = NULL, ...)
    pdata(formula, q, data = NULL, ...)
    rdata(formula, n, data = NULL, ...)
    ddata(formula, q, data = NULL, ...)
```

## Arguments

formula a formula or a vector
$p \quad a$ vector of probabilities
data a data frame in which to evaluate formula
... additional arguments passed to quantile or sample
q
a vector of quantiles
n number of values to sample

## Value

For qdata, a vector of quantiles
for cdata, a data frame giving upper and lower limits and the central proportion requested
For pdata, a vector of probabilities
For rdata, a vector of sampled values.
For ddata, a vector of probabilities (empirical densities)

## Examples

```
data(iris)
qdata(Sepal.Length ~ Species, 0.5, data=iris)
qdata(~Sepal.Length, p = 0.5, groups=Species, data=iris)
qdata(iris$Sepal.Length, p = 0.5)
qdata(~ Sepal.Length, p = 0.5, data=iris)
qdata(~ Sepal.Length, p = 0.5, groups=Species, data=iris)
data(iris)
cdata(iris$Sepal.Length, 0.5)
cdata( ~ Sepal.Length, 0.5, data = iris)
cdata( ~ Sepal.Length, 0.5, data = iris)
cdata( ~ Sepal.Length | Species, data = iris, p = .5)
data(iris)
pdata(iris$Sepal.Length, 3:6)
pdata( ~ Sepal.Length, 3:6, data=iris)
data(iris)
rdata(iris$Species, 10)
rdata(~Species, n = 10, data=iris)
rdata(Sepal.Length ~ Species, n = 5, data=iris)
data(iris)
ddata(iris$Species, 'setosa')
ddata(~Species, 'setosa', data=iris)
```

qdata_v
The Data Distribution

## Description

Utility functions for density, distribution function, quantile function, and random generation from data.

## Usage

```
    qdata_v(x, p = seq(0, 1, 0.25), na.rm = TRUE, ...)
    qdata_f(x, ..., data = NULL, groups = NULL, na.rm = TRUE)
    cdata_v(x, \(\mathrm{p}=0.95\), na. \(\mathrm{rm}=\) TRUE, ...)
    cdata_f(x, ..., data \(=\) NULL, groups = NULL, na.rm = TRUE)
    pdata_v(x, q, lower.tail = TRUE, ...)
    pdata_f(x, ..., data \(=\) NULL, groups = NULL, na.rm = TRUE)
    rdata_v(x, n, replace = TRUE, ...)
    rdata_f(x, ..., data = NULL, groups = NULL, na.rm = TRUE)
```

```
ddata_v(x, q, ..., data = NULL, log = FALSE, na.rm = TRUE)
ddata_f(x, ..., data = NULL, groups = NULL, na.rm = TRUE)
```

## Arguments

x
$p \quad a$ vector of probabilities
na.rm a logical indicating whether NAs should be removed before computing.
... additional arguments passed to quantile or sample
data a data frame in which to evaluate formula
groups
q
lower.tail
n
replace
log
a grouping variable, typically the name of a variable in data a vector of quantiles a logical indicating whether to use the lower or upper tail probability number of values to sample a logical indicating whether to sample with replacement a logical indicating whether the result should be log transformed

## See Also

ddata(), pdata(), qdata(), rdata(), cdata()

## Illustrated quantile calculations from distributions

## Description

Illustrated quantile calculations from distributions

## Usage

qdist(
dist = "norm",
p ,
plot $=$ TRUE, verbose = FALSE,
invisible = FALSE,
resolution = 500L,
digits = 3L,
xlim,
ylim,
return = c("values", "plot"),
refinements = list(),

```
)
xqgamma(
    p,
    shape,
    rate = 1,
    scale = 1/rate,
    lower.tail = TRUE,
    log.p = FALSE,
)
xqt(p, df, ncp, lower.tail = TRUE, log.p = FALSE, ...)
xqchisq(p, df, ncp = 0, lower.tail = TRUE, log.p = FALSE, ...)
xqf(p, df1, df2, lower.tail = TRUE, log.p = FALSE, ...)
xqbinom(p, size, prob, lower.tail = TRUE, log.p = FALSE, ...)
xqpois(p, lambda, lower.tail = TRUE, log.p = FALSE, ...)
xqgeom(p, prob, lower.tail = TRUE, log.p = FALSE, ...)
xqnbinom(p, size, prob, mu, lower.tail = TRUE, log.p = FALSE, ...)
xqbeta(p, shape1, shape2, ncp = 0, lower.tail = TRUE, log.p = FALSE, ...)
```

## Arguments

| dist | a character description of a distribution, for example "norm", "t", or "chisq" |
| :--- | :--- |
| $p$ | a vector of probabilities |
| plot | a logical indicating whether a plot should be created |
| verbose | a logical |
| invisible | a logical |
| resolution | number of points used for detecting discreteness and generating plots. The de- <br> fault value of 5000 should work well except for discrete distributions that have <br> many distinct values, especially if these values are not evenly spaced. |
| digits | the number of digits desired |
| xlim | x limits. By default, these are chosen to show the central $99.8 \backslash$ of the distribution. |
| ylim | y limits |
| return | If "plot", return a plot. If "values", return a vector of numerical values. |
| refinements | A list of refinements to the plot. See ggformula: :gf_refine(). |

|  | additional arguments, including parameters of the distribution and additional options for the plot. To help with name collisions (eg size for binomial distributions and shape for gamma distributions), argument names beginning plot_ will be renamed to remove plot_ and passed only to the plot. The unprefixed version will used as a parameter for the the distribution. |
| :---: | :---: |
| shape | shape and scale parameters. Must be positive, scale strictly. |
| rate | an alternative way to specify the scale. |
| scale | shape and scale parameters. Must be positive, scale strictly. |
| lower.tail | logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X>x]$. |
| log.p | logical; if TRUE, probabilities/densities $p$ are returned as $\log (p)$ |
| df | degrees of freedom ( $>0$, maybe non-integer). $\mathrm{df}=\mathrm{Inf}$ is allowed. |
| ncp | non-centrality parameter $\delta$; currently except for $\mathrm{rt}($ ), only for $\mathrm{abs}(\mathrm{ncp})<=$ 37.62. If omitted, use the central $t$ distribution. |
| df1 | degrees of freedom. Inf is allowed. |
| df2 | degrees of freedom. Inf is allowed. |
| size | number of trials (zero or more). |
| prob | probability of success on each trial. |
| lambda | vector of (non-negative) means. |
| mu | alternative parametrization via mean: see 'Details'. |
| shape1 | non-negative parameters of the Beta distribution. |
| shape2 | non-negative parameters of the Beta distribution. |

## Details

The most general function is qdist which can work with any distribution for which a q-function exists. As a convenience, wrappers are provided for several common distributions.

## Value

a vector of quantiles; a plot is printed as a side effect

## Examples

```
qdist("norm", seq(.1, .9, by = 0.10),
    title = "Deciles of a normal distribution", show.legend = FALSE,
    pattern = "rings")
xqnorm(seq(.2, .8, by = 0.20), mean = 100, sd = 10)
qdist("unif", .5)
xqgamma(.5, shape = 3, scale = 4)
xqgamma(.5, shape = 3, scale = 4, color = "black")
xqbeta(.5, shape1 = .9, shape2 = 1.4, dlwd = 1)
xqchisq(c(.25,.5,.75), df = 3)
xcbinom(c(0.80, 0.90), size = 1000, prob = 0.40)
# displayed as if continuous
xcbinom(c(0.80, 0.90), size = 5000, prob = 0.40)
xpbinom(c(480, 500, 520), size = 1000, prob = 0.48)
```

```
xpbinom(c(40, 60), size = 100, prob = 0.5)
xqpois(c(0.25, 0.5, 0.75), lambda = 12)
xcpois(0.50, lambda = 12)
xcpois(0.50, lambda = 12, refinements = list(scale_color_brewer(type = "qual", palette = 5)))
```

rand Random Regressors

## Description

A utility function for producing random regressors with a specified number of degrees of freedom.

## Usage

rand(df $=1$, rdist $=$ rnorm, args = list(), nrow, seed $=$ NULL)

## Arguments

df degrees of freedom, i.e., number of random regressors
rdist random distribution function for sampling
args arguments for rdist
nrow number of rows in resulting matrix. This can often be omitted in the context of functions like $1 m$ where it is inferred from the data frame, if one is provided.
seed seed for random number generation

## Value

A matrix of random variates with df columns. In its intended use, the number of rows will be selected to match the size of the data frame supplied to 1 m

## Examples

```
rand(2, nrow=4)
rand(2,rdist=rpois, args=list(lambda=3), nrow=4)
summary(lm( waiting ~ eruptions + rand(1), faithful))
```

## read.file Read data files

## Description

A wrapper around various file reading functions.

## Usage

```
    read.file(
        file,
        header = T,
        na.strings = "NA",
        comment.char = NULL,
        filetype = c("default", "csv", "txt", "tsv", "fw", "rdata"),
        stringsAsFactors = FALSE,
        readr = FALSE,
        package = NULL,
    )
```

## Arguments

file character: The name of the file which the data are to be read from. This may also be a complete URL or a path to a compressed file. If it does not contain an absolute path, the file name is relative to the current working directory, getwd (). Tilde-expansion is performed where supported. See read.table() for more details.
header logical; For .txt and .csv files, this indicates whether the first line of the file includes variables names.
na.strings character: strings that indicate missing data.
comment. char character: a character vector of length one containing a single character or an empty string. Use "" to turn off the interpretation of comments altogether.
filetype one of "default", "csv", "txt", or "rdata" indicating the type of file being loaded. The default is to use the filename to guess the type of file.
stringsAsFactors
a logical indicating whether strings should be converted to factors. This has no affect when using readr.
readr a logical indicating whether functions from the readr package should be used, if available.
package if specified, files will be searched for among the documentation files provided by the package.
... additional arguments passed on to read. table(), or load() or one of the functions in the readr package. Note that a message will indicate which underlying function is being used.

[^0]
## Details

Unless filetype is specified, read. file uses the (case insensitive) file extension to determine how to read data from the file. If file ends in .rda or .rdata, then load() is used to load the file. If file ends in .csv, then readr: : read_csv() or read. $\operatorname{csv}()$ is used. Otherwise, read.table() is used.

## Value

A data frame, unless file unless filetype is "rdata", in which case arbitrary objects may be loaded and a character vector holding the names of the loaded objects is returned invisibly.

## See Also

read.csv(), read.table(), readr: : read_table(), readr: :read_csv(), load().

## Examples

\#\# Not run:
Dome <- read.file("http://www.mosaic-web.org/go/datasets/Dome.csv")
\#\# End(Not run)
relm Resample a Linear Model

## Description

Fit a new model to data created using resample(model).

## Usage

relm(model, ..., envir = environment(formula(model)))

## Arguments

$$
\begin{array}{ll}
\text { model } & \text { a linear model object produced using } \operatorname{lm}() . \\
\ldots & \text { additional arguments passed through to resample(). } \\
\text { envir } & \text { an environment in which to (re)evaluate the linear model. }
\end{array}
$$

## See Also

resample()

## Examples

```
    mod <- lm(length ~ width, data = KidsFeet)
    do(1) * mod
    do(3) * relm(mod)
    # use residual resampling to estimate standard error (very crude because so few replications)
    Boot <- do(100) * relm(mod)
    sd(~ width, data = Boot)
    # standard error as produced by summary() for comparison
    mod %>% summary() %>% coef()
```

    repeater-class Repeater objects
    
## Description

Repeater objects can be used with the * operator to repeat things multiple time using a different syntax and different output format from that used by, for example, replicate().

## Slots

n : Object of class "numeric" indicating how many times to repeat something.
cull: Object of class "function" that culls the output from each repetition.
mode: Object of class "character" indicating the output mode ('default', 'data.frame', 'matrix', 'vector', or 'list'). For most purposes 'default' (the default) should suffice.
algorithm: an algorithm number.
parallel: a logical indicating whether to attempt parallel execution.

## Description

These functions simplify and unify sampling in various ways.

## Usage

```
resample(..., replace = TRUE)
deal(...)
shuffle(x, replace = FALSE, prob = NULL, groups = NULL, orig.ids = FALSE)
sample(x, size, replace = FALSE, ...)
## Default S3 method:
sample(
    x,
    size,
    replace = FALSE,
    prob = NULL,
    groups = NULL,
    orig.ids = FALSE,
)
## S3 method for class 'data.frame'
sample(
    x,
    size,
    replace = FALSE,
    prob = NULL,
    groups = NULL,
    orig.ids = TRUE,
    fixed = names(x),
    shuffled = c(),
    invisibly.return = NULL,
)
## S3 method for class 'matrix'
sample(
    x,
    size,
    replace = FALSE,
    prob = NULL,
    groups = NULL,
    orig.ids = FALSE,
)
## S3 method for class 'factor'
sample(
    x,
```

```
    size,
    replace = FALSE,
    prob = NULL,
    groups = NULL,
    orig.ids = FALSE,
    drop.unused.levels = FALSE,
    ...
)
```

## Arguments

```
... additional arguments passed to base::sample() or mosaic::sample().
replace Should sampling be with replacement?
x Either a vector of one or more elements from which to choose, or a positive
        integer.
    prob A vector of probability weights for obtaining the elements of the vector being
        sampled.
    groups a vector (or variable in a data frame) specifying groups to sample within. This
        will be recycled if necessary.
    orig.ids a logical; should original ids be included in returned data frame?
    size a non-negative integer giving the number of items to choose.
    fixed a vector of column names. These variables are shuffled en masse, preserving
        associations among these columns.
    shuffled a vector of column names. these variables are reshuffled individually (within
        groups if groups is specified), breaking associations among these columns. ex-
        amples.
    invisibly.return
        a logical, should return be invisible?
    drop.unused.levels
        a logical, should unused levels be dropped?
```

## Details

These functions are wrappers around sample() providing different defaults and natural names.

## Examples

\# 100 Bernoulli trials -- no need for replace=TRUE
resample(0:1, 100)
tally (resample(0:1, 100))
if (require(mosaicData)) \{
Small <- sample(KidsFeet, 10)
resample(Small)
tally(~ sex, data=resample(Small))
tally (~ sex, data=resample(Small))
\# fixed marginals for sex
tally( $\sim$ sex, data=Small)

```
tally(~ sex, data=resample(Small, groups=sex))
# shuffled can be used to reshuffle some variables within groups
# orig.id shows where the values were in original data frame.
Small <- mutate(Small,
    id1 = paste(sex,1:10, sep=":"),
    id2 = paste(sex,1:10, sep=":"))
resample(Small, groups=sex, shuffled=c("id1","id2"))
}
deal(Cards, 13) # A Bridge hand
shuffle(Cards)
```

rescale Rescale

## Description

Rescale vectors or variables within data frames. This can be useful for comparing vectors that are on different scales, for example in parallel plots or heatmaps.

## Usage

```
rescale(x, range, domain = NULL, ...)
## S3 method for class 'data.frame'
rescale(x, range = c(0, 1), domain = NULL, ...)
## S3 method for class 'factor'
rescale(x, range, domain = NULL, ...)
## S3 method for class 'numeric'
rescale(x, range = c(0, 1), domain = NULL, ...)
## Default S3 method:
rescale(x, range = c(0, 1), domain = NULL, ...)
## S3 method for class 'character'
rescale(x, range = c(0, 1), domain = NULL, ...)
```

## Arguments

x
range
domain a numeric vector of length 2 or NULL
... additional arguments
rflip Tossing Coins

## Description

These functions simplify simulating coin tosses for those (students primarily) who are not yet familiar with the binomial distributions or just like this syntax and verbosity better.

## Usage

rflip( $\mathrm{n}=1$,
prob $=0.5$,
quiet = FALSE,
verbose = !quiet,
summarize = FALSE,
summarise = summarize
)
\#\# S3 method for class 'cointoss'
print(x, ...)
$n f l i p(n=1, \operatorname{prob}=0.5, \ldots)$

## Arguments

n
prob probability of heads on each toss
quiet a logical. If TRUE, less verbose output is used.
verbose a logical. If TRUE, more verbose output is used.
summarize if TRUE, return a summary (as a data frame).
summarise alternative spelling for summarize.
x
... additional arguments

## Value

for rflip, a cointoss object
for $n f l i p$, a numeric vector

## Examples

```
rflip(10)
rflip(10, prob = 1/6, quiet = TRUE)
rflip(10, prob = 1/6, summarize = TRUE)
do(5) * rflip(10)
as.numeric(rflip(10))
nflip(10)
```

rfun Generate a natural-looking function

## Description

Produce a random function that is the sum of Gaussian random variables
rpoly2 generates a random 2 nd degree polynomial (as a function)

## Usage

rfun(vars $=\sim x \& y$, seed $=$ NULL, $n=0$ )
rpoly2(vars $=\sim x \& y$, seed $=$ NULL $)$

## Arguments

vars a formula; the LHS is empty and the RHS indicates the variables used for input to the function (separated by \&)
seed seed for random number generator, passed to set.seed().
n
the number of Gaussians. By default, this will be selected randomly.

## Details

rfun is an easy way to generate a natural-looking but random function with ups and downs much as you might draw on paper. In two variables, it provides a good way to produce a random landscape that is smooth. Things happen in the domain -5 to 5 . The function is pretty flat outside of that. Use seed to create a fixed function that will be the same for everybody

These functions are particularly useful for teaching calculus.

## Value

a function with the appropriate number of inputs
a function defined by a 2 nd degree polynomial with coefficients selected randomly according to a Unif( $-1,1$ ) distribution.

## Examples

$f<-r f u n(\sim u \& v)$
plotFun( $f(u, v) \sim u \& v, u=r a n g e(-5,5), v=r a n g e(-5,5))$
myfun <- rfun(~ u \& v, seed=1959)
g <- rpoly2( ~ x\&y\&z, seed=1964)
plotFun(g $(x, y, z=2) \sim x \& y, x l i m=r a n g e(-5,5), y l i m=r a n g e(-5,5))$
rlatlon Sample longitude and latitude on a sphere

## Description

Randomly samples longitude and latitude on earth so that equal areas are (approximately) equally likely to be sampled. (Approximation assumes earth as a perfect sphere.)

## Usage

rlatlon(...)
rlonlat(...)
rgeo( $\mathrm{n}=1$, latlim $=\mathrm{c}(-90,90)$, lonlim $=c(-180,180)$, verbose $=$ FALSE $)$
$\operatorname{rgeo} 2(\mathrm{n}=1$, latlim $=c(-90,90)$, lonlim $=c(-180,180)$, verbose $=$ FALSE $)$

## Arguments

... arguments passed through to other functions
$n \quad$ number of random locations
latlim, lonlim range of latitudes and longitudes to sample within, only implemented for rgeo.
verbose return verbose output that includes Euclidean coordinates on unit sphere as well as longitude and latitude.

## Details

rgeo and rgeo 2 differ in the algorithms used to generate random positions. Each assumes a spherical globe. rgeo uses that fact that each of the $\mathrm{x}, \mathrm{y}$ and z coordinates is uniformly distributed (but not independent of each other). Furthermore, the angle about the z -axis is uniformly distributed and independent of z . This provides a straightforward way to generate Euclidean coordinates using runif. These are then translated into latitude and longitude.
rlatlon is an alias for rgeo and rlonlat is too, expect that it reverses the order in which the latitude and longitude values are returned.
rgeo2 samples points in a cube by independently sampling each coordinate. It then discards any point outside the sphere contained in the cube and projects the non-discarded points to the sphere. This method must oversample to allow for the discarded points.

Value
a data frame with variables long and lat. If verbose is TRUE, then $x, y$, and $z$ coordinates are also included in the data frame.

## See Also

deg2rad(), googleMap() and latlon2xyz().

## Examples

```
rgeo(4)
# sample from a region that contains the continental US
rgeo(4, latlim = c(25,50), lonlim = c(-65, -125))
rgeo2(4)
```

rspin Simulate spinning a spinner

## Description

This is essentially rmultinom with a different interface.

## Usage

rspin(n, probs, labels = 1:length(probs))

## Arguments

n
number of spins of spinner
probs a vector of probabilities. If the sum is not 1 , the probabilities will be rescaled.
labels a character vector of labels for the categories

## Examples

```
rspin(20, prob=c(1,2,3), labels=c("Red", "Blue", "Green"))
do(2) * rspin(20, prob=c(1,2,3), labels=c("Red", "Blue", "Green"))
```

| rsquared $\quad$ Extract $r$-squared value |
| :--- |

## Description

Attempts to extract an r-squared value from a model or model-like object.

## Usage

rsquared (x, ...)

## Arguments

x
an object
... additional arguments
rstudio_is_available Check whether RStudio is in use

## Description

This functions checks that RStudio is in use. It will likely be removed from this package once the versions of RStudio in popular use rely on the manipulate package on CRAN which will provide its own version.

## Usage

rstudio_is_available()

## Value

a logical

## Description

When the parallel package is used, setting the RNG seed for reproducibility involves more than simply calling set.seed(). set.rseed takes care of the additional overhead.

## Usage

set.rseed(seed)

## Arguments

seed seed for the random number generator

## Details

If the parallel package is not on the search path, then set. seed() is called. If parallel is on the search path, then the RNG kind is set to "L'Ecuyer-CMRG", the seed is set and mc.reset. stream is called.

## Examples

```
# These should give identical results, even if the `parallel' package is loaded.
set.rseed(123); do(3) * resample(1:10, 2)
set.rseed(123); do(3) * resample(1:10, 2)
```

    sp2df Transforms a shapefile into a dataframe
    
## Description

This function takes in a shapefile (formal class of SpatialPolygonsDataFrame) and transforms it into a dataframe

## Usage

sp2df(map, ...)

## Arguments

map A map object of class SpatialPolygonsDataFrame
... Other arguments, currently ignored

## Value

A dataframe, in which the first 7 columns hold geographical information (ex: long and lat)

## Examples

```
## Not run:
if(require(maptools)) {
        data(wrld_simpl)
        worldmap <- sp2df(wrld_simpl)
}
if ( require(ggplot2) && require(maptools) ) {
    data(wrld_simpl)
    World <- sp2df(wrld_simpl)
    World2 <- merge(World, Countries, by.x="NAME", by.y="maptools", all.y=FALSE)
    Mdata <- merge(Alcohol, World2, by.x="country", by.y="gapminder", all.y=FALSE)
    Mdata <- Mdata[order(Mdata$order),]
    qplot( x=long, y=lat, fill=ntiles(alcohol,5),
            data=subset(Mdata, year==2008), group = group,
                geom="polygon")
}
## End(Not run)
```

standardName Standardization of Geographic Names

## Description

Often different sources of geographical data will use different names for the same region. These utilities make it easier to merge data from different sources by converting names to standardized forms.

## Usage

## standardName(

x ,
standard,
ignore.case = TRUE,
returnAlternatives = FALSE,
quiet $=$ FALSE
)
standardCountry(
x ,
ignore.case = TRUE,
returnAlternatives = FALSE,

```
    quiet = FALSE
)
standardState(x, ignore.case = TRUE, returnAlternatives = FALSE, quiet = FALSE)
```

## Arguments

x

| standard |
| :--- |$\quad$| A vector with the region names to standardize |
| :--- |
| a named vector providing the map from non-standard names (names of vector) |
| to standard names (values of vector) |

| ignore.case |
| :--- |
| returnAlternatives |
| a logical indicating whether case should be ignored when matching. |

| a logical indicating whether all alternatives should be returned in addition to the |
| :--- |
| standard name. |

quiet $\quad$| a logical indicating whether warnings should be suppressed |
| :--- |

## Details

standardName This is the most general standardizing function. In addition to x , this function requires another argument: standard - a named vector in which each name is a particular spelling of the region name in question and the corresponding value is the standardized version of that region name
standardCountry This function will standardize the country names in $x$ to the standard ISO_a3 country code format. If returnAlternatives is set to TRUE, this function will also return the the named vector used to standardize the country names
standardState This function will standardize the US state names in $x$ to the standard two-letter abbreviations. If returnAlternatives is set to TRUE, this function will also return the the named vector used to standardize the state names
In all three cases, any names not found in standard will be left unaltered. Unless supressed, a warning message will indicate the number of such cases, if there are any.

```
statTally Tally test statistics
```

## Description

Tally test statistics from data and from multiple draws from a simulated null distribution

## Usage

```
statTally(
    sample,
    rdata,
    FUN,
    direction = NULL,
```

```
    alternative = c("default", "two.sided", "less", "greater"),
    sig.level = 0.1,
    system = c("gg", "lattice"),
    shade = "navy",
    alpha = 0.1,
    binwidth = NULL,
    bins = NULL,
    fill = "gray80",
    color = "black",
    center = NULL,
    stemplot = dim(rdata)[direction] < 201,
    q = c(0.5, 0.9, 0.95, 0.99),
    fun = function(x) x,
    xlim,
    quiet = FALSE,
)
```

## Arguments

| sample | sample data |
| :---: | :---: |
| rdata | a matrix of randomly generated data under null hypothesis. |
| FUN | a function that computes the test statistic from a data set. The default value does nothing, making it easy to use this to tabulate precomputed statistics into a null distribution. See the examples. |
| direction | 1 or 2 indicating whether samples in rdata are in rows (1) or columns (2). |
| alternative | one of default, two.sided, less, or greater |
| sig.level | significance threshold for wilcox. test used to detect lack of symmetry |
| system | graphics system to use for the plot |
| shade | a color to use for shading. |
| alpha | opacity of shading. |
| binwidth | bin width for histogram. |
| bins | number of bins for histogram. |
| fill | fill color for histogram. |
| color | border color for histogram. |
| center | center of null distribution |
| stemplot | indicates whether a stem plot should be displayed |
| q | quantiles of sampling distribution to display |
| fun | same as FUN so you don't have to remember if it should be capitalized |
| $x \mathrm{lim}$ | limits for the horizontal axis of the plot. |
| quiet | a logicial indicating whether the text output should be suppressed |
|  | additional arguments passed to lattice: :histogram() or ggplot2: :geom_histogram() |

## Value

A lattice or ggplot showing the sampling distribution.
As side effects, information about the empirical sampling distribution and (optionally) a stem plot are printed to the screen.

## Examples

```
# is my spinner fair?
x <- c(10, 18, 9, 15) # counts in four cells
rdata <- rmultinom(999, sum(x), prob = rep(.25, 4))
statTally(x, rdata, fun = max, binwidth = 1) # unusual test statistic
statTally(x, rdata, fun = var, shade = "red", binwidth = 2) # equivalent to chi-squared test
# Can also be used with test stats that are precomputed.
if (require(mosaicData)) {
D <- diffmean( age ~ sex, data = HELPrct); D
nullDist <- do(999) * diffmean( age ~ shuffle(sex), data = HELPrct)
statTally(D, nullDist)
statTally(D, nullDist, system = "lattice")
}
```

surround Format strings for pretty output

## Description

Format strings for pretty output

## Usage

surround(x, pre $="$ ", post $="$ ", width $=8, \ldots$ )

## Arguments

x
pre text to prepend onto string
post text to postpend onto string
width desired width of string
... additional arguments passed to format ()

## Value

a vector of strings padded to the desired width

## Examples

```
surround(rbinom(10,20,.5), " ", " ", width=4)
surround(rnorm(10), " ", " ", width=8, digits = 2, nsmall = 2)
```

## Description

Swap values among columns of a data frame

## Usage

swap(data, which)

## Arguments

data a data frame
which a formula or an integer or character vector specifying columns in data

## Details

swap is not a particularly speedy function. It is intended primarily as an aid for teaching randomization for paired designs. Used this way, the number of randomizations should be kept modest (approximately 1000) unless you are very patient.

## Examples

```
if (require(tidyr)) {
    Sleep2 <- sleep %>% spread( key=group, val=extra )
    names(Sleep2) <- c("subject", "drug1", "drug2")
    swap(Sleep2, drug1 ~ drug2)
    mean( ~(drug1 - drug2), data=Sleep2)
    do(3) * mean( ~(drug1 - drug2), data=Sleep2 %>% swap(drug1 ~ drug2) )
}
```

theme.mosaic Lattice Theme

## Description

A theme for use with lattice graphics.

## Usage

theme.mosaic(bw = FALSE, lty $=$ if (bw) $1: 7$ else 1 , lwd $=2, \ldots$ )
col.mosaic(bw = FALSE, lty $=$ if (bw) 1:7 else 1, lwd $=2, \ldots$ )

## Arguments

| bw | whether color scheme should be "black and white" |
| :--- | :--- |
| lty | vector of line type codes |
| lwd | vector of line widths |
| $\ldots$ | additional named arguments passed to trellis.par.set() |

## Value

Returns a list that can be supplied as the theme to trellis.par. set().

## Note

These two functions are identical. col.mosaic is named similarly to lattice: :col.whitebg(), but since more than just colors are set, theme.mosaic is a preferable name.

## See Also

trellis.par.set(), show.settings()

## Examples

```
trellis.par.set(theme=theme.mosaic())
show.settings()
trellis.par.set(theme=theme.mosaic(bw=TRUE))
show.settings()
```

theme_map ggplot2 theme for maps

## Description

A very plain ggplot2 theme that is good for maps.

## Usage

theme_map(base_size = 12)

## Arguments

base_size the base font size for the theme.

## Details

This theme is largely based on an example posted by Winston Chang at the ggplot2 Google group forum.

## Description

TukeyHSD() requires use of $\operatorname{aov}()$. Since this is a hindrance for beginners, wrappers have been provided to remove this need.

## Usage

```
## S3 method for class 'lm'
TukeyHSD(x, which, ordered = FALSE, conf.level = 0.95, ...)
## S3 method for class 'formula'
TukeyHSD(
    x,
    which,
    ordered = FALSE,
    conf.level = 0.95,
    data = parent.frame(),
    ...
)
```

## Arguments

x
an object, for example of class Im or formula
which, ordered, conf.level, ...
just as in TukeyHSD() from the base package
data a data frame. NB: This does not come second in the argument list.

## Examples

```
## These should all give the same results
if (require(mosaicData)) {
    model <- lm(age ~ substance, data=HELPrct)
    TukeyHSD(model)
    TukeyHSD( age ~ substance, data=HELPrct)
    TukeyHSD(aov(age ~ substance, data=HELPrct))
}
```

```
t_test Student's t-Test
```

## Description

Performs one and two sample t-tests. The mosaic $t$.test provides wrapper functions around the function of the same name in stats. These wrappers provide an extended interface that allows for a more systematic use of the formula interface.

## Usage

t_test(x, ...)
t.test(x, ...)
\#\# S3 method for class 'formula'
t_test(formula, data, ..., groups = NULL)
\#\# Default S3 method:
t_test (
x ,
$y=$ NULL,
alternative = c("two.sided", "less", "greater"),
mu = 0,
paired = FALSE,
var.equal = FALSE,
conf.level = 0.95,
...
)

## Arguments

x
... further arguments to be passed to or from methods.
formula a formula of the form lhs ~ rhs where lhs is a numeric variable giving the data values and rhs either 1 for a one-sample or paired test or a factor with two levels giving the corresponding groups. If lhs is of class "Pair" and rhs is 1 , a paired test is done
data an optional matrix or data frame (or similar: see model.frame) containing the variables in the formula formula. By default the variables are taken from environment(formula).
groups When x is a formula, groups can be used to compare groups: $\mathrm{x}=\sim$ var, groups $=\mathrm{g}$ is equivalent to $x=v a r \sim g$. See the examples.
$y \quad$ an optional (non-empty) numeric vector of data values.
alternative a character string specifying the alternative hypothesis, must be one of "two. sided" (default), "greater" or "less". You can specify just the initial letter.
mu
paired a logical indicating whether you want a paired t-test.
var.equal a logical variable indicating whether to treat the two variances as being equal. If TRUE then the pooled variance is used to estimate the variance otherwise the Welch (or Satterthwaite) approximation to the degrees of freedom is used.
conf.level confidence level of the interval.

## Details

This is a wrapper around stats: :t.test () from the stats package to extend the functionality of the formula interface. In particular, one can now use the formula interface for a 1 -sample t -test. Before, the formula interface was only permitted for a 2-sample test. The type of formula that can be used for the 2 -sample test has also be broadened. See the examples.

## Value

an object of class htest

## See Also

```
mosaic::prop.test(), mosaic::binom.test(), stats::t.test()
```

## Examples

```
t.test(HELPrct$age)
    # We can now do this with a formula
    t.test(~ age, data = HELPrct)
    # data = can be omitted, but it is better to use it
    t.test(~ age, HELPrct)
    # the original 2-sample formula
    t.test(age ~ sex, data = HELPrct)
    # alternative 2-sample formulas
    t.test(~ age | sex, data = HELPrct)
    t.test(~ age, groups = sex, data = HELPrct)
    # 2-sample t from vectors
    with(HELPrct, t.test(age[sex == "male"], age[sex == "female"]))
    # just the means
    mean(age ~ sex, data = HELPrct)
```

    update_ci Update confidence interval
    
## Description

Update the confidence interval portion of an object returned from binom. test using one of several alternative methods.

## Usage

```
update_ci(
        object,
    method = c("clopper-pearson", "wald", "agresti-coull", "plus4", "score", "prop.test")
)
```

## Arguments

object An "htest" object produced by binom.test()
method a method for computing a confidence interval for a proportion.

## Value

an "htest" object with an updated confidence interval

## See Also

```
    mosaic::binom.test()
```

value

Extract value from an object

## Description

Functions like integrate() and $n \operatorname{lm}()$ return objects that contain more information that simply the value of the integration or optimization. value() extracts the primary value from such objects. Currently implemented situations include the output from integrate(), nlm(), cubature: : adaptIntegrate(), and uniroot().

## Usage

value(object, ...)
\#\# S3 method for class 'integrate'
value(object, ...)
\#\# Default S3 method:
value(object, ...)

## Arguments

object
an object from which a "value" is to be extracted.
. . . additional arguments (currently ignored).

## Examples

```
integrate(sin, 0, 1) %>% value()
nlm(cos, p = 0) %>% value()
uniroot(cos, c(0, 2)) %>% value()
```

xchisq.test Augmented Chi-squared test

## Description

This augmented version of chisq. test() provides more verbose output.

## Usage

```
xchisq.test(
        x,
        y = NULL,
        correct = TRUE,
        p = rep(1/length(x), length(x)),
        rescale.p = FALSE,
        simulate.p.value = FALSE,
        B = 2000,
        data = environment(x)
    )
```

## Arguments

$x, y$, correct, $p$, rescale. $p$, simulate.p. value, $B$
as in chisq.test(), but $x$ may also be a formula, in which case $x$ is replaced by tally ( $x$, data) prior to the call to chisq. test().
data a data frame for use when x is a formula.

## See Also

chisq.test()

## Examples

```
    # Physicians' Health Study data
    phs <- cbind(c(104,189),c(10933,10845))
    rownames(phs) <- c("aspirin","placebo")
    colnames(phs) <- c("heart attack","no heart attack")
    phs
    xchisq.test(phs)
    xchisq.test(sex ~ substance, data = HELPrct)
```

```
xhistogramBreaks Augmented histograms
```

## Description

The mosaic package adds some additional functionality to lattice : : histogram(), making it simpler to obtain certain common histogram adornments. This is done be resetting the default panel and prepanel functions used by histogram.

## Usage

xhistogramBreaks(x, center $=$ NULL, width $=$ NULL, nint, ...)
prepanel.xhistogram(x, breaks = xhistogramBreaks, ...)
panel.xhistogram(
x ,
dcol = trellis.par.get("plot.line")\$col,
dalpha = 1,
dlwd = 2,
gcol = trellis.par.get("add.line")\$col,
glwd = 2,
fcol = trellis.par.get("superpose.polygon")\$col,
dmath = dnorm,
verbose = FALSE,
dn = 100,
args = NULL,
labels = FALSE,
density = NULL,
under = FALSE,
fit = NULL,
start = NULL,
type = "density",
v,
h,
groups = NULL,
center = NULL, width = NULL, breaks, nint $=$ round(1.5 * log2(length(x)) + 1), stripes = c("vertical", "horizontal", "none"), alpha = 1,
)

## Arguments

| center | center of one of the bins |
| :---: | :---: |
| width | width of the bins |
| nint | approximate number of bins |
|  | additional arguments passed from lattice: :histogram() to the panel function; by default when the mosaic package has been loaded this will be panel . xhistogram(). |
| breaks | break points for histogram bins, a function for computing such, or a method hist() knows about given as a character string. When using the mosaic package defaults, mosaic::xhistogramBreaks() is used. |
| dcol | color of density curve |
| dalpha | alpha for density curve |
| dlwd, glwd | like lwd but affecting the density line and guide lines, respectively |
| gcol | color of guidelines |
| fcol | fill colors for histogram rectangles when using groups. (Use col, which is passed through to the histogram panel function, when not using groups.) |
| dmath | density function for density curve overlay |
| verbose | be verbose? |
| dn | number of points to sample from density curve |
| args | a list of additional arguments for dmath |
| labels | should counts/densities/percents be displayed or each bin? |
| density | a logical indicating whether to overlay a density curve |
| under | a logical indicating whether the density layers should be under or over other layers of the plot. |
| fit | a character string describing the distribution to fit. Known distributions include "exponential", "normal", "lognormal", "poisson", "beta", "geometric", "t", "weibull", "cauchy", "gamma", "chisq", and "chi-squared" |
| start | numeric value passed to MASS: : fitdistr() |
| type | one of 'density', 'count', or 'percent' |
| h, v | a vector of values for additional horizontal and vertical lines |
| groups | as per lattice: :histogram() |
| stripes | one of "vertical", "horizontal", or "none", indicating how bins should be striped when groups is not NULL |
| alpha | transparency level |
| panel | a panel function |

## Details

The primary additional functionality added to histogram() are the arguments width and center which provide a simple way of describing equal-sized bins, and fit which can be used to overlay the density curve for one of several distributions. The groups argument can be used to color the bins. The primary use for this is to shade tails of histograms, but there may be other uses as well.

## Value

xhistogramBreaks returns a vector of break points

## Note

Versions of lattice since 0.20-21 support setting custom defaults for breaks, panel, and prepanel used by histogram(), so xhistogram() is no longer needed. As a result, xhistogram() (which was required in earlier versions of mosaic is no longer needed and has been removed.

## See Also

lattice::histogram(), mosaicLatticeOptions(), and restoreLatticeOptions().

## Examples

```
if (require(mosaicData)) {
histogram(~age | substance, HELPrct, v=35, fit='normal')
histogram(~age, HELPrct, labels=TRUE, type='count')
histogram(~age, HELPrct, groups=cut(age, seq(10,80,by=10)))
histogram(~age, HELPrct, groups=sex, stripes='horizontal')
histogram(~racegrp, HELPrct, groups=substance,auto.key=TRUE)
xhistogramBreaks(1:10, center=5, width=1)
xhistogramBreaks(1:10, center=5, width=2)
xhistogramBreaks(0:10, center=15, width=3)
xhistogramBreaks(1:100, center=50, width=3)
xhistogramBreaks(0:10, center=5, nint=5)
}
```

```
xpnorm Augmented versions of pnorm and qnorm
```

## Description

These functions behave similarly to the functions with the initial $\times$ removed from their names but add more verbose output and graphics.

## Usage

```
xpnorm(
    q,
    mean = 0,
    sd = 1,
    plot = TRUE,
    verbose = TRUE,
    invisible = FALSE,
    digits = 4,
    lower.tail = TRUE,
    log.p = FALSE,
```

```
    xlim = mean + c(-4, 4) * sd,
    ylim = c(0, 1.4 * dnorm(mean, mean, sd)),
    manipulate = FALSE,
    return = c("value", "plot")
)
xqnorm(
        p,
        mean = 0,
        sd = 1,
        plot = TRUE,
        verbose = TRUE,
        digits = getOption("digits"),
        lower.tail = TRUE,
        log.p = FALSE,
        xlim,
        ylim,
        invisible = FALSE,
        ...,
        return = c("value", "plot"),
        pattern = c("stripes", "rings")
)
xcnorm(
        p,
        mean = 0,
        sd = 1,
        plot = TRUE,
        verbose = TRUE,
        digits = getOption("digits"),
        lower.tail = TRUE,
        log.p = FALSE,
        xlim,
        ylim,
        invisible = FALSE,
        ...,
        return = c("value", "plot"),
        pattern = "rings"
)
```

## Arguments

q
mean, sd parameters of normal distribution.
plot logical. If TRUE, show an illustrative plot.
verbose logical. If TRUE, display verbose output.
invisible logical. If TRUE, return value invisibly.

| digits | number of digits to display in output. |
| :--- | :--- |
| lower.tail | logical. If FALSE, use upper tail probabilities. |
| log.p | logical. If TRUE, uses the log of probabilities. |
| xlim, ylim | limits for plotting. |
| manipulate | logical. If TRUE and in RStudio, then sliders are added for interactivity. |
| $\ldots$ | additional arguments. |
| return | If "plot", return a plot. If "values", return a vector of numerical values. |
| p | probability |
| pattern | One of "stripes" or "rings". In the latter case, pairs of regions (from inside <br> to outside) are grouped together for coloring and probability calculation. |

## See Also

histogram(), chisq.test(), pnorm(), qnorm(), qqmath(), and plot().

## Examples

```
xpnorm(650, 500, 100)
xqnorm(.75, 500, 100)
xpnorm(-3:3, return = "plot", system = "gg") %>%
    gf_labs(title = "My Plot", x = "") %>%
    gf_theme(theme_bw())
## Not run:
if (rstudio_is_available() & require(manipulate)) {
        manipulate(xpnorm(score, 500, 100, verbose = verbose),
            score = slider(200, 800),
        verbose = checkbox(TRUE, label = "Verbose Output")
    )
}
## End(Not run)
```

xqqmath

## Description

Augmented version of qqmath

## Usage

```
xqqmath(x, data = NULL, panel = "panel.xqqmath", ...)
    panel.xqqmath(
        x,
        qqmathline = !(fitline || idline),
        idline = FALSE,
        fitline = NULL,
        slope = NULL,
        intercept = NULL,
        overlines = FALSE,
        groups = NULL,
        ...,
        col.line = trellis.par.get("add.line")$col,
        pch = 16,
        lwd = 2,
        lty = 2
    )
```

## Arguments

x, data, panel, xqqmath, ...
as in lattice: :qqmath()
qqmathline a logical: should line be displayed passing through first and third quartiles?
idline a logical; should the line $\mathrm{y}=\mathrm{x}$ be added to the plot?
fitline a logical; should a fitted line be added to plot? Such a line will use slope and
intercept if provided, else the standard deviation and mean of the data. If
slope is specified, the line will be added unless fitline is FALSE.
slope slope for added line
intercept intercept for added line
overlines a logical: should lines be on top of qq plot?
groups, pch, lwd, lty
as in lattice plots
col.line color to use for added lines

## Value

a trellis object

## Examples

```
\(x<-r n o r m(100)\)
xqqmath ( ~ x) \# with quartile line
xqqmath( ~ x, fitline = TRUE) \# with fitted line
xqqmath ( \(\sim x\), idline \(=\) TRUE \() \quad \#\) with \(y=x\)
\(x<-\operatorname{rexp}(100\), rate \(=10)\)
xqqmath ( \(\sim\) x, distribution \(=\) qexp \() \quad\) \# with quartile line
```

```
xqqmath( ~ x, distribution = qexp, slope = 1/10)
xqqmath( ~ x, distribution = qexp, slope = mean(x))
```

xyz2latlon

## Description

Convert back and forth between latitude/longitude and XYZ-space

## Usage

xyz2latlon(x, y, z)
latlon2xyz(latitude, longitude)
lonlat2xyz(longitude, latitude)

## Arguments

$x, y, z \quad$ numeric vectors
latitude, longitude
vectors of latitude and longitude values

## Value

a matrix each row of which describes the latitudes and longitudes
a matrix each row of which contains the $x, y$, and $z$ coordinates of a point on a unit sphere

## See Also

deg2rad(), googleMap(), and rgeo().

## Examples

```
xyz2latlon(1, 1, 1) # point may be on sphere of any radius
xyz2latlon(0, 0, 0) # this produces a NaN for latitude
latlon2xyz(30, 45)
lonlat2xyz(45, 30)
```

## Description

Compute z-scores

## Usage

zscore(x, na.rm = getOption("na.rm", FALSE))

## Arguments

x
na.rm
a numeric vector
a logical indicating whether missing values should be removed

## Examples

```
iris %>%
    group_by(Species) %>%
    mutate(zSepal.Length = zscore(Sepal.Length)) %>%
    head()
```
