

Package ‘multibiplotGUI’

June 19, 2015

Encoding latin1

Type Package

Title Multibiplot Analysis in R

Version 1.0

Date 2015-06-15

Author Ana Belen Nieto Librero <ananieto@usal.es>, Nora Baccala

<norabaccala@gmail.com>, Purificacion Vicente Galindo

<purivg@usal.es>, Purificacion Galindo Villardon

<pgalindo@usal.es>

Maintainer Ana Belen Nieto Librero <ananieto@usal.es>

Description A GUI with which users can construct and interact
with Multibiplot Analysis and provides inferential results by using Bootstrap Methods.

License GPL (>= 2)

Depends R (>= 3.1.1)

Imports rgl, tkplot, tcltk, tcltk2, shapes, cluster, dendroextras,
Matrix

SystemRequirements Tcl/Tk package BWidget.

Repository CRAN

NeedsCompilation no

Examples

```
data(iris)
multibiplot(iris[,-5], c(50,50,50))
```

Description

A GUI with which users can construct and interact with Multibiplot Analysis and provides inferential results by using Bootstrap Methods.

Usage

```
multibiplot(x, ni)
```

Arguments

x	A data frame in which the different datasets have been juxtaposed
ni	A vector specifying the length of each dataset

Details

When the function is launched with the appropriate arguments, firstly, it is necessary to select the kind of data to be analyzed. Then, an option window is displayed where you can change the color, the size, the label and/or the symbol of an element or of a set of elements; to select the transformation data, to select the kind of Biplot factorization to be applied, to change the window size containing the graphs and to tick the checkbox to show the axes in the graph. Press the Graph button and then choose the number of axes to be retained. When the graph will be shown, the function will allow you to change characteristics of the points with the mouse. Press the right mouse button and a window will be displayed to change the color, the size, the label and/or the symbol of the nearest point of position clicked. Press the left mouse button and a window will be displayed to select one option: Change the position label, Remove label or Do nothing. It is also possible to select the dimensions shown in the graph and to change the limits of the axes. In the window there are six menus with their corresponding submenus:

- File
 - Copy image
 - Save image
 - * PDF file
 - * Eps file
 - * Png file
 - * Jpg/Jpeg file
 - Exit
- 3D
 - 3D
- Projections
 - Variables

- Back to original data
- Options
 - Change title
 - Show/Hide axes
- Cluster
 - Hierarchical cluster with biplot coordinates
 - K-means with biplot coordinates
 - K-medoids with biplot coordinates
 - Back to original graph
- Bootstrap
 - Bootstrap

The File menu provides different options to save the graph and permits to exit the program. The second menu shows the graph in 3 dimensions. The third menu allows the user to project the individuals onto the direction representing one variable selected from a listbox. This menu permits to go back to original graph. The following menu permits to change the title and to show/hide the axes in the graph. The fifth menu allows the user to analyze the biplot coordinates with clustering techniques. The last menu provides inferential results using Bootstrap methods. It is possible to select the number of resamples to be extracted and the confidence level to calculate the intervals presented in the results. This menu saves a file containing the results and graphs with histograms and QQ-plots generated with the bootstrap replications.

Value

A graph showing the data representation, an output file containing the contributions, qualities of representation, goodness of fit, coordinates and eigen values and output files containing these results in a classical and inferential form.
