

# Package ‘nCDunnett’

November 16, 2015

**Type** Package

**Title** Noncentral Dunnett's Test Distribution

**Version** 1.1.0

**Date** 2015-11-14

**Author** Siomara Cristina Broch, Daniel Furtado Ferreira

**Maintainer** Daniel Furtado Ferreira <danielff@dex.ufla.br>

**Depends** R (>= 2.15.0)

**Description** Computes the noncentral Dunnett's test distribution (pdf, cdf and quantile) and generates random numbers.

**License** GPL (>= 2)

**URL** [www.dex.ufla.br/~danielff/r\\_resources.html](http://www.dex.ufla.br/~danielff/r_resources.html)

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2015-11-16 16:20:29

nCDunnett

*Noncentral Dunnett's test distribution*

---

## Description

Computes the probability density, the cumulative distribution and the quantile functions and generates random samples for the noncentral Dunnett's test distribution with the numbers means equal to dimension of the vector rho that correspond to the correlation structure, the degrees of freedom equal to nu and the number of points of the Gauss-Legendre quadrature equal to n. The parameter of noncentrality is the vector delta, with the same dimension of rho. The two-sided test should be choosen with the two.sided option, where the default is true.

## Usage

```
dNCDun(q, nu, rho, delta, n=32, two.sided = TRUE)
pNCDun(q, nu, rho, delta, n=32, two.sided = TRUE)
qNCDun(p, nu, rho, delta, n=32, two.sided = TRUE)
rNCDun(N = 1, nu = Inf, rho, delta, two.sided=TRUE)
```

## Arguments

<code>q</code>	vector of quantiles $q \in R$ .
<code>p</code>	vector of probabilities $(0, 1)$ .
<code>rho</code>	vector of correlations, with length equal or greater than 1.
<code>N</code>	vector size to be simulated, with $N > 1$ .
<code>nu</code>	degrees of freedom $\nu > 0$ .
<code>n</code>	number of points of the gaussian quadrature $n > 2$ .
<code>delta</code>	vector of noncentrality parameter. Must be of the same length of <code>rho</code> .
<code>two.sided</code>	if true (default) the two-sided distribution is considered, else the one-sided distribution is considered.

## Details

Assumes  $n = 32$  as default value for `dNCDun`, `pNCDun` and `qNCDun`. The `nu` can be a finite real number or an infinity real number. The default value of `nu` is `Inf` in `rNCDun`. When `nu=1`, the convergence of the routines requires  $n>200$  points in the Gaussian quadrature to obtain the desired result accurately. The cumulative distribution function of the noncentral unilateral Dunnett's test statistic with finite degrees of freedom  $\nu$  is

$$F(q; r, \nu, \boldsymbol{\rho}, \boldsymbol{\delta}) = \int_0^\infty \int_{-\infty}^\infty \phi(y) \prod_{j=1}^r \Phi\left(\frac{\sqrt{\rho_j}y + xq - \delta_j}{\sqrt{1 - \rho_j}}\right) f(x; \nu) dy dx,$$

where  $\boldsymbol{\rho} = [\rho_1, \rho_2, \dots, \rho_r]^\top$  is the correlation vector,  $\boldsymbol{\delta} = [\delta_1, \delta_2, \dots, \delta_r]^\top$  is the vector of noncentrality parameter,  $q$  is the quantile of the noncentral unilateral Dunnett's test distribution,  $r$  is the numbers of means (or sample size) and  $\nu$  is the degrees of freedom of a independent chi-square variable in the studentized process. The  $f(x; \nu)$  probability density function is given by

$$f(x; \nu) = \frac{\nu^{\nu/2}}{\Gamma(\nu/2)2^{\nu/2-1}} x^{\nu-1} e^{-\nu x^2/2}, \quad x \geq 0.$$

The cumulative distribution function of the noncentral unilateral Dunnett's test statistic with infinity degrees of freedom is

$$F(q; r, \nu = \infty, \boldsymbol{\rho}, \boldsymbol{\delta}) = \int_{-\infty}^\infty \phi(y) \prod_{j=1}^r \Phi\left(\frac{\sqrt{\rho_j}y + q - \delta_j}{\sqrt{1 - \rho_j}}\right) dy.$$

The cumulative distribution function of the noncentral bilateral Dunnett's test statistic with finite degrees of freedom  $\nu$  is

$$F(q; r, \nu, \boldsymbol{\rho}, \boldsymbol{\delta}) = \int_0^\infty \int_{-\infty}^\infty \phi(y) \prod_{j=1}^r \left[ \Phi\left(\frac{\sqrt{\rho_j}y + xq - \delta_j}{\sqrt{1 - \rho_j}}\right) - \Phi\left(\frac{\sqrt{\rho_j}y - xq - \delta_j}{\sqrt{1 - \rho_j}}\right) \right] f(x; \nu) dy dx.$$

Finally, the cumulative distribution function of the noncentral bilateral Dunnett's test statistic with infinity degrees of freedom is

$$F(q; r, \nu = \infty, \rho, \delta) = \int_{-\infty}^{\infty} \phi(y) \prod_{j=1}^r \left[ \Phi\left(\frac{\sqrt{\rho_j}y + q - \delta_j}{\sqrt{1 - \rho_j}}\right) - \Phi\left(\frac{\sqrt{\rho_j}y - q - \delta_j}{\sqrt{1 - \rho_j}}\right) \right] dy.$$

### Value

dNCDun gives the density, pNCDun gives the cumulative distribution function, qNCDun gives the quantile function, and rNCDun generates random deviates.

### Author(s)

Siomara Cristina Broch and Daniel Furtado Ferreira.

Maintainer: Daniel Furtado Ferreira <danielff@dex.uflla.br>

### Examples

```
library(nCDunnett)
n <- 50
nu <- 9
rho <- c(0.5,0.5,0.5)
delta <- c(0,0,0)
x <- rNCDun(n, nu, rho, delta)
hist(x)
q <- 2.30
p <- 0.95
prob <- length(x[x<=q])/n
prob
pNCDun(q, nu, rho, delta, 32, TRUE)
dNCDun(q, nu, rho, delta, 32, TRUE)
qNCDun(p, nu, rho, delta, 16, TRUE)

q      <- c(2.34, 4.50, 3.40)
p      <- c(0.85, 0.95, 0.975)
nu     <- c(Inf, 19, 15)
# unbalanced example
rho    <- c(0.23, 0.25, 0.27)
delta <- c(0, 0, 0) # central case
pNCDun(q, nu, rho, delta, 32, TRUE)
dNCDun(q, nu, rho, delta, 32, TRUE)
qNCDun(p, nu, rho, delta, 16, TRUE)
```
