# Package 'nlgeocoder'

October 8, 2018

October 8, 2018
Title Geocoding for the Netherlands
Version 0.1.3
<b>Description</b> R interface to the open location server API of 'Publieke Diensten Op de Kaart' ( <a href="http://www.pdok.nl">http://www.pdok.nl</a> ). It offers geocoding, address suggestions and lookup of geographical objects. Included is an utility function for displaying leaflet tiles restricted to the Netherlands.
<b>Depends</b> R (>= 3.4)
License GPL-2
BugReports https://github.com/uRos2018/nlgeocoder/issues
<pre>URL https://github.com/uRos2018/nlgeocoder</pre>
Encoding UTF-8
LazyData true
RoxygenNote 6.1.0
Suggests testthat, knitr, rmarkdown, sf, shiny, leaflet
VignetteBuilder knitr
Imports jsonlite
NeedsCompilation no

nlge	nlgeocoder-package nlgeocoder package																				

# Description

The nlgeocoder package provides a R wrapper around the pdok webservice.

#### **Details**

it allows to geocode data using the following functions:

- nl\_geocode: geocode a vector of addresses.
- nl\_free: find possible matches for one address.
- nl\_suggest: find possible suggestions for one address.
- nl\_lookup: lookup information of object found in nl\_suggest.

# Author(s)

Maintainer: Edwin de Jonge <edwindjonge@gmail.com>

addPdokTiles 3

addPdokTiles

Leaflet function to add pdok tiles

#### **Description**

This function adds PDOK tile layers to leaflet. It is a small wrapper around addTiles that sets the correct urls for the layers.

# Usage

```
addPdokTiles(map, type = c("brt", "aerial", "pastel", "gray"),
  group = match.arg(type), ...)
```

# **Arguments**

```
map leaflet object

type one of the PDOK tiles: currently: "brt", "aerial", "pastel" or "gray"

group group is set equal to type

... Passed to addTiles.
```

#### **Details**

PDOK provides tiles that can be used as a tile layer in several geovisualization tools including leaflet. The layers differ from other tile layers such as Openstreetmap, Google and cartomap in the following manner:

- The tiles are restricted to the Netherlands: tiles accross the Dutch border are "grayed out". This is useful for cartographic applications that are restricted to Dutch geo-information.
- The tiles are open source and based on open sourced geo-information.

addresses

Several Points of Interest (POI) that are included for test purposes.

# **Description**

- POI, points of interest
- Address, Uncleaned address information.

#### Usage

addresses

#### **Format**

An object of class data. frame with 5 rows and 2 columns.

anl\_free

nl_free Free geocoding search
-------------------------------

# Description

This function wraps the "free" pdok service, and allows for free search. For syntax and examples see the documentation of pdok. A more easy/convenient but simpler function for geocoding is nl\_geocode.

# Usage

```
nl_free(q, rows = NULL, start = NULL, fq = NULL, lat = NULL,
lon = NULL, type = NULL, fl = NULL, df = NULL, ...,
verbose = FALSE)
```

# Arguments

q	query to geocoding service.
rows	maximum number of rows to be returned. Default is 10.
start	start index.Default is 0.
fq	apply a filter to the query, e.g. fq=bron:BAG. The default filter is 'type:(municipality OR town OR neiborhood OR road OR postcode OR adress)'. Use fq=* to remove the default filter.
lat	enter a decimal degree (latitude, in WGS84). Together with lon this will define a point to search from. Search results will be ordered by distance from this point. For example: 'lat=52.09&lon=5.12'
lon	enter a decimal degree (longitude, in WGS84). Together with lat this will define point to search from. Search results will be ordered by distance from this point. For example: 'lat=52.09&lon=5.12'
type	restrict the results on a specific type.
fl	fields to return.
df	field that should be search in.
	parameters passed to the pdok webservice
verbose	logical should the function print out messages.

#### Value

The result of the pdok free webservice converted to a R list object.

# See Also

```
{\tt nl\_geocode}
```

nl\_geocode 5

#### **Examples**

```
1 <- nl_free("Henri Faasdreef 312")
1$response$numFound
1$response$docs["weergavenaam"]</pre>
```

nl\_geocode

Geocode adresses

# Description

nl\_geocode returns for a vector of addresses the most probable object/location. This function is more user friendly than the barebones webservices (nl\_free), and uses the same function signature as ggmap::geocode.

# Usage

```
nl_geocode(location, output = c("wgs84", "rd", "data.frame"),
   messaging = FALSE, type = "adres", ..., verbose = messaging)

nl_geocode_rd(location, messaging = FALSE, type = "adres", ...,
   verbose = messaging)

nl_geocode_df(location, messaging = FALSE, type = "adres", ...,
   verbose = messaging)
```

#### **Arguments**

location	string with location to be found
output	Should the output be a ${\tt data.frame}$ or ${\tt sf}$ object in wgs84 or Rijksdriehoekstelsel format?
messaging	Print the urls fired to the webserver (consistent with 'ggmap::geocode')
type	restrict the type of object that is returned from the service, see details for possible types.
	will be passed to nl_free.
verbose	identical to messaging (consistent with other nlgeoder functions)

#### **Details**

```
type can be one or more of the following: "provincie", "gemeente", "woonplaats", "weg", "post-code", "adres", "perceel", "hectometerpaal", "wijk", "buurt", "waterschapsgrens", "appartementsrecht".
```

#### Value

The return type can be specified and can be of type "sf" or "data.frame", depending on the value of output.

nl\_reverse

#### **Examples**

```
data("addresses")
r <- nl_geocode(addresses$Address)
r["weergavenaam"]
names(r)</pre>
```

nl\_lookup

Look up a geo object

# **Description**

Retrieve detailed properties of a geo object found with nl\_suggest or nl\_free.

# Usage

```
nl_lookup(id, ..., output = c("list", "raw"), verbose = FALSE)
```

# **Arguments**

id of object found in nl\_suggest or nl\_free

... extra parameters are passed to the lookup service of pdok.

output What type of output should be returned

verbose should the function print message while retrieving the data?

# Value

Depending on the value of output the raw search results in R format or the properties of the specific object as a R list object.

# **Examples**

```
obj <- nl_lookup("weg-f633e85f07eda4e68a00fb13f9d128f5")
names(obj)
obj$weergavenaam</pre>
```

nl\_reverse

experimental reverse api

# **Description**

experimental reverse api

# Usage

```
nl_reverse()
```

nl\_suggest 7

# Description

nl\_suggest returns a list of suggestions for a location description.

# Usage

```
nl_suggest(q, ..., rows = NULL, type = NULL, verbose = FALSE,
    fl = NULL, sort = NULL, qf = NULL, bq = NULL)
```

# **Arguments**

q	search terms that should be geolocated
	parameters passed to geolocation service
rows	maximum number of rows to be returned. Default is 10.
type	restrict type of geolocation to a type (see details for possible types)
verbose	Should the functions print messages on what it is retrieving.
fl	the columns that should be returned (aka select on columns of result)
sort	how the data should be sorted
qf	the fields that should be queried
bq	the boosting of the query.

#### **Details**

```
type can be one or more of the following: "provincie", "gemeente", "woonplaats", "weg", "post-code", "adres", "perceel", "hectometerpaal", "wijk", "buurt", "waterschapsgrens", "appartementsrecht".
```

# Value

The result of the pdok suggest webservice converted to a R list object.

# **Examples**

```
sug <- nl_suggest("Henri Faasdreef")
# how many objects have a score?
sug$response$numFound
# get suggestions
sug$response$docs</pre>
```
