

Package ‘nnTensor’

June 4, 2020

Type Package

Title Non-Negative Tensor Decomposition

Version 1.0.5

Author Koki Tsuyuzaki, Manabu Ishii, Itoshi Nikaido

Maintainer Koki Tsuyuzaki <k.t.the-answer@hotmail.co.jp>

Suggests testthat

Depends R (>= 3.4.0)

Imports methods, fields, rTensor, plot3D, tagcloud, ggplot2

Description Some functions for performing non-negative matrix factorization, non-negative CANDECOMP/PARAFAC (CP) decomposition, non-negative Tucker decomposition, and generating toy model data. See Andrzej Cichock et al (2009) <doi:10.1002/9780470747278> and the reference section of GitHub README.md <<https://github.com/rikenbit/nnTensor>>, for details of the methods.

Description

Some functions for performing non-negative matrix factorization, non-negative CANDECOMP/PARAFAC (CP) decomposition, non-negative Tucker decomposition, and generating toy model data. See Andrzej Cichock et al (2009) <doi:10.1002/9780470747278> and the reference section of GitHub README.md <<https://github.com/rikenbit/nnTensor>>, for details of the methods.

Details

The DESCRIPTION file:

Package:	nnTensor
Type:	Package
Title:	Non-Negative Tensor Decomposition
Version:	1.0.5
Author:	Koki Tsuyuzaki, Manabu Ishii, Itoshi Nikaido
Maintainer:	Koki Tsuyuzaki <k.t.the-answer@hotmail.co.jp>
Suggests:	testthat
Depends:	R (>= 3.4.0)
Imports:	methods, fields, rTensor, plot3D, tagcloud, ggplot2
Description:	Some functions for performing non-negative matrix factorization, non-negative CANDECOMP/PARAFAC (CP) decomposition, non-negative Tucker decomposition, and generating toy model data.
License:	Artistic-2.0
URL:	https://github.com/rikenbit/nnTensor

Index of help topics:

NMF	Non-negative Matrix Factorization Algorithms (NMF)
NTD	Non-negative Tucker Decomposition Algorithms (NTD)
NTF	Non-negative CP Decomposition Algorithms (NTF)
jNMF	Joint Non-negative Matrix Factorization Algorithms (jNMF)
nnTensor-package	Non-Negative Tensor Decomposition
plot.NMF	Plot function of the result of NMF function
plotTensor3D	Plot function for visualization of tensor data structure
recTensor	Tensor Reconstruction from core tensor (S) and factor matrices (A)
siNMF	Simultaneous Non-negative Matrix Factorization Algorithms (siNMF)
toyModel	Toy model data for using NMF, NTF, and NTD

ls("package:nnTensor")
```

jNMF

Joint Non-negative Matrix Factorization Algorithms (jNMF)

Description

The input data objects are assumed to be non-negative matrices. jNMF decompose the matrices to two low-dimensional factor matices simultaneously.

Usage

```
jNMF(X, M=NULL, initW=NULL, initV=NULL, initH=NULL, fixW=FALSE, fixV=FALSE,
      fixH=FALSE, J = 3, w=NULL, algorithm = c("Frobenius", "KL", "IS", "PLTF"),
      p=1, thr = 1e-10, num.iter = 100, viz = FALSE, figdir = NULL, verbose = FALSE)
```

Arguments

X	A list containing input matrices (X_k , $\langle N^*M_k \rangle$, $k=1..K$).
M	A list containing the mask matrices (X_k , $\langle N^*M_k \rangle$, $k=1..K$). If the input matrix has missing values, specify the element as 0 (otherwise 1).
initW	The initial values of factor matrix W, which has N-rows and J-columns (Default: NULL).
initV	A list containing the initial values of multiple factor matrices (V_k , $\langle N^*J \rangle$, $k=1..K$, Default: NULL).
initH	A list containing the initial values of multiple factor matrices (H_k , $\langle M_k^*J \rangle$, $k=1..K$, Default: NULL).
fixW	Whether the factor matrix W is updated in each iteration step (Default: FALSE).
fixV	Whether the factor matrices V_k are updated in each iteration step (Default: FALSE).
fixH	Whether the factor matrices H_k are updated in each iteration step (Default: FALSE).
J	Number of low-dimension ($J < N, M_k$).
w	Weight vector (Default: NULL)
algorithm	Divergence between X and X_{bar} . "Frobenius", "KL", and "IS" are available (Default: "KL").
p	The parameter of Probabilistic Latent Tensor Factorization (p=0: Frobenius, p=1: KL, p=2: IS)

thr	When error change rate is lower than thr, the iteration is terminated (Default: 1E-10).
num.iter	The number of interation step (Default: 100).
viz	If viz == TRUE, internal reconstructed matrix can be visualized.
figdir	the directory for saving the figure, when viz == TRUE.
verbose	If verbose == TRUE, Error change rate is generated in console windos.

Value

W : A matrix which has N-rows and J-columns ($J < N, M_k$). V : A list which has multiple elements containing N-rows and J-columns ($J < N, M_k$). H : A list which has multiple elements containing M_k -rows and J-columns matrix ($J < N, M_k$). RecError : The reconstruction error between data matrix and reconstructed matrix from W and H. TrainRecError : The reconstruction error calculated by training set (observed values specified by M). TestRecError : The reconstruction error calculated by test set (missing values specified by M). RelChange : The relative change of the error.

Examples

```
matdata <- toyModel(model = "siNMF_Hard")
out <- jNMF(matdata, J=2, num.iter=2)
```

Description

The input data is assumed to be non-negative matrix. NMF decompose the matrix to two low-dimensional factor matices. This function is also used as initialization step of tensor decomposition (see also NTF and NTD).

Usage

```
NMF(X, M=NULL, initU=NULL, initV=NULL, fixU=FALSE, fixV=FALSE, J = 3,
rank.method=c("all", "ccc", "dispersion", "rss", "evar", "residuals",
"sparseness.basis", "sparseness.coef", "sparseness2.basis",
"sparseness2.coef", "norm.info.gain.basis", "norm.info.gain.coef",
"singular", "volume", "condition"), runtime=30,
algorithm = c("Frobenius", "KL", "IS", "Pearson", "Hellinger", "Neyman",
"Alpha", "Beta", "PGD", "HALS", "GCD"), Alpha = 1, Beta = 2,
eta = 1e-04, thr1 = 1e-10, thr2 = 1e-10, tol = 1e-04,
num.iter = 100, viz = FALSE, figdir = NULL, verbose = FALSE)
```

Arguments

X	The input matrix which has N-rows and M-columns.
M	The mask matrix which has N-rows and M-columns. If the input matrix has missing values, specify the element as 0 (otherwise 1).
initU	The initial values of factor matrix U, which has N-rows and J-columns (Default: NULL).
initV	The initial values of factor matrix V, which has M-rows and J-columns (Default: NULL).
fixU	Whether the factor matrix U is updated in each iteration step (Default: FALSE).
fixV	Whether the factor matrix V is updated in each iteration step (Default: FALSE).
J	The number of low-dimension (J < N, M). If a numerical vector is specified (e.g. 2:6), the appropriate rank is estimated.
rank.method	The rank estimation method (Default: "all"). Only if the J option is specified as a numerical vector longer than two, this option will be active.
runtime	The number of trials to estimate rank (Default: 10).
algorithm	NMF algorithms. "Frobenius", "KL", "IS", "Pearson", "Hellinger", "Neyman", "HALS", "PGD", "Alpha", "Beta", and "GCD" are available (Default: "KL").
Alpha	The parameter of Alpha-divergence.
Beta	The parameter of Beta-divergence.
eta	The stepsize for PGD algorithm (Default: 0.0001).
thr1	When error change rate is lower than thr1, the iteration is terminated (Default: 1E-10).
thr2	If the minus-value is generated, replaced as thr2 (Default: 1E-10). This value is used within the internal function .positive().
tol	The tolerance parameter used in GCD algorithm.
num.iter	The number of interation step (Default: 100).
viz	If viz == TRUE, internal reconstructed matrix can be visualized.
figdir	The directory for saving the figure, when viz == TRUE.
verbose	If verbose == TRUE, Error change rate is generated in console window.

Value

U : A matrix which has N-rows and J-columns ($J < N, M$). V : A matrix which has M-rows and J-columns ($J < N, M$). J : The number of dimension ($J < N, M$). RecError : The reconstruction error between data tensor and reconstructed tensor from U and V. TrainRecError : The reconstruction error calculated by training set (observed values specified by M). TestRecError : The reconstruction error calculated by test set (missing values specified by M). RelChange : The relative change of the error. Trial : All the results of the trials to estimate the rank. Runtime : The number of the trials to estimate the rank. RankMethod : The rank estimation method.

Examples

```
if(interactive()){
  # Test data
  matdata <- toyModel(model = "NMF")

  # Simple usage
  out <- NMF(matdata, J=5)

  # Rank estimation mode (single method)
  out2 <- NMF(matdata, J=2:10, rank.method="ccc", runtime=3)
  plot(out2)

  # Rank estimation mode (all method)
  out3 <- NMF(matdata, J=2:10, rank.method="all", runtime=10)
  plot(out3)
}
```

Description

The input data is assumed to be non-negative tensor. NTD decompose the tensor to the dense core tensor (S) and low-dimensional factor matices (A).

Usage

```
NTD(X, M=NULL, initS=NULL, initA=NULL, fixS=FALSE, fixA=FALSE,
rank = c(3, 3, 3), modes = 1:3,
algorithm = c("Frobenius", "KL", "IS", "Pearson", "Hellinger",
"Neyman", "HALS", "Alpha", "Beta"), init = c("NMF", "ALS", "Random"),
Alpha = 1,
Beta = 2, thr = 1e-10, num.iter = 100, viz = FALSE,
figdir = NULL, verbose = FALSE)
```

Arguments

X	The input tensor which has I1, I2, and I3 dimensions.
M	The mask tensor which has I1, I2, and I3 dimensions. If the mask tensor has missing values, specify the element as 0 (otherwise 1).
initS	The initial values of core tensor which has J1, J2, and J3 dimensions (Default: NULL).
initA	A list containing the initial values of multiple factor matrices (A_k, <Ik*Jk>, k=1..K, Default: NULL).
fixS	Whether the core tensor S is updated in each iteration step (Default: FALSE).
fixA	Whether the factor matrices Ak are updated in each iteration step (Default: FALSE).
rank	The number of low-dimension in each mode (J1, J2, J3, J1<I1, J2<I2, J3 < I3) (Default: c(3,3,3)).
modes	The vector of the modes on whih to perform the decomposition (Default: 1:3 <all modes>).
algorithm	NTD algorithms. "Frobenius", "KL", "IS", "Pearson", "Hellinger", "Neyman", "HALS", "Alpha", and "Beta" are available (Default: "Frobenius").
init	The initialization algorithms. "NMF", "ALS", and "Random" are available (Default: "NMF").
Alpha	The parameter of Alpha-divergence.
Beta	The parameter of Beta-divergence.
thr	When error change rate is lower than thr1, the iteration is terminated (Default: 1E-10).
num.iter	The number of interation step (Default: 100).
viz	If viz == TRUE, internal reconstructed tensor can be visualized.
figdir	the directory for saving the figure, when viz == TRUE (Default: NULL).
verbose	If verbose == TRUE, Error change rate is generated in console windos.

Value

S : Tensor object, which is defined as S4 class of rTensor package. A : A list containing three factor matrices. RecError : The reconstruction error between data tensor and reconstructed tensor from S and A. TrainRecError : The reconstruction error calculated by training set (observed values specified by M). TestRecError : The reconstruction error calculated by test set (missing values specified by M). RelChange : The relative change of the error.

out <- NTD(tensordata, rank=c(2,2,2), algorithm="Frobenius",
           init="Random", num.iter=2)
```

Description

The input data is assumed to be non-negative tensor. NTF decompose the tensor to the diagonal core tensor (S) and low-dimensional factor matrices (A).

Usage

```
NTF(X, M=NULL, initA=NULL, fixA=FALSE, rank = 3,
     algorithm = c("Frobenius", "KL", "IS", "Pearson", "Hellinger", "Neyman",
                  "HALS", "Alpha-HALS", "Beta-HALS", "Alpha", "Beta"),
     init = c("NMF", "ALS", "Random"), Alpha = 1,
     Beta = 2, thr = 1e-10, num.iter = 100, viz = FALSE,
     figdir = NULL, verbose = FALSE)
```

Arguments

X	The input tensor which has I1, I2, and I3 dimensions.
M	The mask tensor which has I1, I2, and I3 dimensions. If the mask tensor has missing values, specify the element as 0 (otherwise 1).
initA	A list containing the initial values of multiple factor matrices (A_k, <I_k * J_k>, k=1..K, Default: NULL).
fixA	Whether the factor matrices A_k are updated in each iteration step (Default: FALSE).
rank	The number of low-dimension in each mode (J1=J2=J3, J1 < I1, J2 < I2, J3 < I3) (Default: 3).
algorithm	NTF algorithms. "Frobenius", "KL", "IS", "Pearson", "Hellinger", "Neyman", "HALS", "Alpha-HALS", "Beta-HALS", "Alpha", and "Beta" are available (Default: "Frobenius").
init	The initialization algorithms. "NMF", "ALS", and "Random" are available (Default: "NMF").
Alpha	The parameter of Alpha-divergence.
Beta	The parameter of Beta-divergence.
thr	When error change rate is lower than thr1, the iteration is terminated (Default: 1E-10).
num. iter	The number of interation step (Default: 100).
viz	If viz == TRUE, internal reconstructed tensor can be visualized.
figdir	the directory for saving the figure, when viz == TRUE (Default: NULL).
verbose	If verbose == TRUE, Error change rate is generated in console windos.

Value

S : Tensor object, which is defined as S4 class of rTensor package. A : A list containing three factor matrices. RecError : The reconstruction error between data tensor and reconstructed tensor from S and A. TrainRecError : The reconstruction error calculated by training set (observed values specified by M). TestRecError : The reconstruction error calculated by test set (missing values specified by M). RelChange : The relative change of the error.

plot.NMF*Plot function of the result of NMF function***Description**

Only if J is specified as a vector longer than 1, this function will be active.

Usage

```
plot(x, ...)
```

Arguments

- x The result of NMF function (NMF class).
- ... Optional parameter for plot.

Value

A ggplot will be gerarated.

plotTensor3D

Plot function for visualization of tensor data structure

Description

Combined with recTensor function and the result of NTF or NTD, the reconstructed tensor structure can be visualized.

Usage

```
plotTensor3D(X = NULL)
```

Arguments

X Tensor object, which is defined as S4 class of rTensor package.

Author(s)

Koki Tsuyuzaki

Examples

```
tensordata <- toyModel(model = "CP")

out <- NTF(tensordata, rank=3, algorithm="Beta-HALS", num.iter=2)

tmp <- tempdir()

png(filename=paste0(tmp, "/NTF.png"))
plotTensor3D(recTensor(out$S, out$A))
dev.off()
```

recTensor*Tensor Reconstruction from core tensor (S) and factor matrices (A)*

Description

Combined with plotTensor3D function and the result of NTF or NTD, the reconstructed tensor structure can be visualized.

Usage

```
recTensor(S = NULL, A = NULL, idx = 1:3, reverse = FALSE)
```

Arguments

S	Tensor object, which is defined as S4 class of rTensor package.
A	A list containing three factor matrices.
idx	The direction of mode-n multiplication (Default: 1:3). For example idx=1 is defined. S x_1 A is calculated (x_1 : mode-1 multiplication).
reverse	If reverse = TRUE, t(A[[n]]) is multiplied to S (Default: FALSE).

Value

Tensor object, which is defined as S4 class of rTensor package.

Author(s)

Koki Tsuyuzaki

See Also

[Tensor-class](#), [NTF](#), [NTD](#)

Examples

```
tensordata <- toyModel(model = "CP")
out <- NTF(tensordata, rank=3, algorithm="Beta-HALS", num.iter=2)
rec <- recTensor(out$S, out$A)
```

Description

The input data objects are assumed to be non-negative matrices. siNMF decompose the matrices to two low-dimensional factor matices simultaneously.

Usage

```
siNMF(X, M=NULL, initW=NULL, initH=NULL, fixW=FALSE, fixH=FALSE, J = 3,
      w=NULL, algorithm = c("Frobenius", "KL", "IS", "PLTF"), p=1,
      thr = 1e-10, num.iter = 100,
      viz = FALSE, figdir = NULL, verbose = FALSE)
```

Arguments

X	A list containing the input matrices ($X_k, <N*Mk>$, $k=1..K$).
M	A list containing the mask matrices ($X_k, <N*Mk>$, $k=1..K$). If the input matrix has missing values, specify the element as 0 (otherwise 1).
initW	The initial values of factor matrix W, which has N-rows and J-columns (Default: NULL).
initH	A list containing the initial values of multiple factor matrices ($H_k, <Mk*J>$, $k=1..K$, Default: NULL).
fixW	Whether the factor matrix W is updated in each iteration step (Default: FALSE).
fixH	Whether the factor matrices H_k are updated in each iteration step (Default: FALSE).
J	Number of low-dimension ($J < N, Mk$).
w	Weight vector (Default: NULL)
algorithm	Divergence between X and X_{bar} . "Frobenius", "KL", and "IS" are available (Default: "KL").
p	The parameter of Probabilistic Latent Tensor Factorization (p=0: Frobenius, p=1: KL, p=2: IS)
thr	When error change rate is lower than thr, the iteration is terminated (Default: 1E-10).
num.iter	The number of interation step (Default: 100).
viz	If viz == TRUE, internal reconstructed matrix can be visualized.
figdir	the directory for saving the figure, when viz == TRUE.
verbose	If verbose == TRUE, Error change rate is generated in console windos.

Value

W : A matrix which has N-rows and J-columns ($J < N, M_k$). H : A list which has multiple elements containing M_k -rows and J-columns matrix ($J < N, M_k$). RecError : The reconstruction error between data matrix and reconstructed matrix from W and H. TrainRecError : The reconstruction error calculated by training set (observed values specified by M). TestRecError : The reconstruction error calculated by test set (missing values specified by M). RelChange : The relative change of the error.

toyModel

Toy model data for using NMF, NTF, and NTD

Description

The data is used for confirming the algorithm are properly working.

Usage

```
toyModel(model = "CP", seeds=123)
```

Arguments

model	Single character string is specified. "NMF", "CP", and "Tucker" are available (Default: "CP").
seeds	Random number for setting set.seeds in the function (Default: 123).

Value

If model is specified as "NMF", a matrix is generated. Otherwise, a tensor is generated.
