

Package ‘pdynmc’

July 27, 2020

Type Package

Title Moment Condition Based Estimation of Linear Dynamic Panel Data Models

Version 0.9.1

Date 2020-07-24

Author Markus Fritsch [aut, cre],
Joachim Schnurbus [aut],
Andrew Adrian Yu Pua [aut]

Maintainer Markus Fritsch <Markus.Fritsch@uni-Passau.de>

Depends R (>= 3.6.0)

Imports data.table (>= 1.12.2), MASS (>= 7.3-51.4), Matrix (>= 1.2-17), optimx (>= 2018-07.10), qlcMatrix (>= 0.9.7), stats (>= 3.6.0), Rdpack (>= 0.11-0)

Suggests plm (>= 2.2-0), testthat (>= 2.3.2), R.rsp (>= 0.43.2)

RdMacros Rdpack

Description Linear dynamic panel data modeling based on linear and nonlinear moment conditions as proposed by Holtz-Eakin, Newey, and Rosen (1988) <doi:10.2307/1913103>, Ahn and Schmidt (1995) <doi:10.1016/0304-4076(94)01641-C>, and Arellano and Bover (1995) <doi:10.1016/0304-4076(94)01642-D>. Estimation of the model parameters relies on numerical optimization and the computation of closed form solutions. For inference and specification testing, Windmeijer (2005) <doi:10.1016/j.jeconom.2004.02.005> corrected standard errors, serial correlation tests, tests for overidentification, and Wald tests are available.

case.names.pdynmc

Case and Variable Names of Fitted Model.

Description

case.names extracts variable names of cross-sectional and longitudinal identifiers of an object of class ‘pdynmc’.

Usage

```
## S3 method for class 'pdyncmc'
case.names(object, ...)
```

Arguments

object	An object of class ‘pdyncmc’.
...	further arguments.

Value

A list containing two character vectors with the variable names of the cross-sectional and the longitudinal identifiers from object of class ‘pdyncmc’.

Author(s)

Markus Fritsch

```

coef.pdynmc*Extract Coefficient Estimates of Fitted Model.***Description**

`coef.pdynmc` extracts coefficient estimates of an object of class ‘pdynmc’.

Usage

```
## S3 method for class 'pdynmc'
coef(object, ...)
```

Arguments

<code>object</code>	An object of class ‘pdynmc’.
<code>...</code>	further arguments.

Value

Extract coefficient estimates from object of class ‘pdynmc’.

              opt.meth = "none")
coef(m1)
}

```

Description

`data.info` shows basic structure of a balanced/unbalanced panel data set contained in a ‘`data.frame`’.

Usage

```
data.info(object, i.name = NULL, t.name = NULL, ...)
```

Arguments

<code>object</code>	An object of class ‘ <code>data.frame</code> ’.
<code>i.name</code>	Column name of cross-section identifier.
<code>t.name</code>	Column name of time-series identifier.
...	further arguments.

Value

Returns information if panel data set contained in an object of class ‘`data.frame`’ is a balanced or unbalanced panel data set.

```

dummy.coef.pdynmc	<i>Extract Coefficient Estimates of Time Dummies of Fitted Model.</i>
-------------------	---

Description

dummy.coef.pdynmc extracts coefficient estimates of time dummies of an object of class ‘pdynmc’.

Usage

```
## S3 method for class 'pdynmc'
dummy.coef(object, ...)
```

Arguments

object	An object of class ‘pdynmc’.
...	further arguments.

Value

Extract coefficient estimates of time dummies from object of class ‘pdynmc’.

fitted.pdynmc*Extract Fitted Values of Fitted Model.***Description**

`fitted.pdynmc` extracts fitted values of an object of class ‘pdynmc’.

Usage

```
## S3 method for class 'pdynmc'
fitted(object, step = object$iter, na.rm = FALSE, ...)
```

Arguments

- | | |
|---------------------|--|
| <code>object</code> | An object of class ‘pdynmc’. |
| <code>step</code> | An integer denoting the iteration step for which fitted values are extracted (defaults to last iteration step used for obtaining parameter estimates). |
| <code>na.rm</code> | A logical variable indicating whether missing values should be removed from the vector of fitted values (defaults to ‘FALSE’). |
| ... | further arguments. |

Value

Extract fitted values from object of class ‘pdynmc’.

jtest.fct*Hansen J-Test.***Description**

`jtest.fct` tests the validity of the overidentifying restrictions.

Usage

```
jtest.fct(object)
```

Arguments

object	An object of class ‘pdynmc’.
--------	------------------------------

Details

The null hypothesis is that the overidentifying restrictions are valid. The test statistic is computed as proposed by Hansen (1982). As noted by Bowsher (2002) and Windmeijer (2005) the test statistic is weakened by many instruments.

Value

An object of class ‘htest’ which contains the Hansen J-test statistic and corresponding p-value for the null hypothesis that the overidentifying restrictions are valid.

Description

`model.matrix.pdyncmc` extracts instrument matrix of an object of class ‘pdyncmc’.

Usage

```
## S3 method for class 'pdyncmc'
model.matrix(object, sparse = TRUE, ...)
```

Arguments

object	An object of class ‘pdyncmc’.
sparse	Whether to return a sparse matrix (if set to ‘TRUE’) or a regular matrix (if set to ‘FALSE’).
...	further arguments.

Value

Extracts instrument matrix from an object of class ‘pdyncmc’.

mtest.fct*Arellano and Bond Serial Correlation Test.***Description**

`mtest.fct` tests for serial correlation in the error terms.

Usage

```
mtest.fct(object, t.order)
```

Arguments

- | | |
|----------------------|--|
| <code>object</code> | An object of class ‘pdynmc’. |
| <code>t.order</code> | A number denoting the order of serial correlation to test for. |

Details

The null hypothesis is that there is no serial correlation of a particular order. The test statistic is computed as proposed by Arellano and Bond (1991).

Value

An object of class ‘htest’ which contains the Arellano and Bond m test statistic and corresponding p-value for the null hypothesis that there is no serial correlation of the given order.

```

Description

The pdynmc package provides four categories of functions that are available to the user: A function for model fitting, functions for visualizing estimation results and panel data structures, functions for specification testing, and functions that extract and summarize particular information from fitted model objects.

pdynmc fits a linear dynamic panel data model based on moment conditions with the Generalized Method of Moments (GMM).

Usage

```
pdynmc(
  dat,
  varname.i,
  varname.t,
  use.mc.diff,
  use.mc.lev,
  use.mc.nonlin,
  use.mc.nonlinAS = NULL,
  inst.stata = FALSE,
  include.y,
  varname.y = NULL,
  lagTerms.y = NULL,
  maxLags.y = NULL,
  include.x = FALSE,
  varname.reg.end = NULL,
  lagTerms.reg.end = NULL,
  maxLags.reg.end = NULL,
  varname.reg.pre = NULL,
  lagTerms.reg.pre = NULL,
  maxLags.reg.pre = NULL,
  varname.reg.ex = NULL,
  lagTerms.reg.ex = NULL,
  maxLags.reg.ex = NULL,
  include.x.instr = FALSE,
  varname.reg.instr = NULL,
  include.x.toInstr = FALSE,
  varname.reg.toInstr = NULL,
  fur.con = FALSE,
  fur.con.diff = NULL,
  fur.con.lev = NULL,
  varname.reg.fur = NULL,
  lagTerms.reg.fur = NULL,
  include.dum = TRUE,
  dum.diff = NULL,

```

Arguments

<code>dat</code>	A data set.
<code>varname.i</code>	The name of the cross-section identifier.
<code>varname.t</code>	The name of the time-series identifier.
<code>use.mc.diff</code>	A logical variable indicating whether moment conditions from equations in differences (i.e. instruments in levels) should be used.
<code>use.mc.lev</code>	A logical variable indicating whether moment conditions from equations in levels (i.e. instruments in differences) should be used.
<code>use.mc.nonlin</code>	A logical variable indicating whether nonlinear (quadratic) moment conditions should be used.
<code>use.mc.nonlinAS</code>	A logical variable indicating whether only the nonlinear (quadratic) moment conditions in the form proposed by Ahn and Schmidt (1995) should be used (defaults to 'TRUE').
<code>inst.stata</code>	A logical variable indicating whether to use the moment conditions from equations in levels as in Stata implementations xtabond2 Roodman (2018) and xtdpdgmm Kripfganz (2019).
<code>include.y</code>	A logical variable indicating whether instruments should be derived from the lags of the response variable.
<code>varname.y</code>	A character string denoting the name of the response variable in the data set.
<code>lagTerms.y</code>	An integer indicating the number of lags of the dependent variable used as explanatory variables.
<code>maxLags.y</code>	An integer indicating the maximum number of lags of the dependent variable from which instruments should be derived.

<code>include.x</code>	A logical variable indicating whether instruments should be derived from the covariates. Setting the argument to ‘TRUE’ requires specifying whether the covariates are endogenous, predetermined, or (strictly) exogenous (defaults to ‘FALSE’).
<code>varname.reg.end</code>	One or more character strings denoting the covariate(s) in the data set to be treated as endogenous (defaults to ‘NULL’).
<code>lagTerms.reg.end</code>	One or more integers indicating the number of lags of the endogenous covariate(s) used as explanatory variables. One integer per covariate needs to be given in the same order as the covariate names (defaults to ‘NULL’).
<code>maxLags.reg.end</code>	One or more integers indicating the maximum number of lags of the endogenous covariate(s) used for deriving instruments. One integer per covariate needs to be given in the same order as the covariate names (defaults to ‘NULL’).
<code>varname.reg.pre</code>	One or more character strings denoting the covariate(s) in the data set to be treated as predetermined (defaults to ‘NULL’).
<code>lagTerms.reg.pre</code>	One or more integers indicating the number of lags of the predetermined covariate(s) used as explanatory variables. One integer per covariate needs to be given in the same order as the covariate name (defaults to ‘NULL’).
<code>maxLags.reg.pre</code>	One or more integers indicating the maximum number of lags of the predetermined covariate(s) used for deriving instruments. One integer per covariate needs to be given in the same order as the covariate names (defaults to ‘NULL’).
<code>varname.reg.ex</code>	One or more character strings denoting the covariate(s) in the data set to be treated as (strictly) exogenous (defaults to ‘NULL’).
<code>lagTerms.reg.ex</code>	One or more integers indicating the number of lags of the (strictly) exogenous covariate(s) used as explanatory variables. One integer per covariate needs to be given in the same order as the covariate name (defaults to ‘NULL’).
<code>maxLags.reg.ex</code>	One or more integers indicating the maximum number of lags of the (strictly) exogenous covariate(s) used for deriving instruments. One integer per covariate needs to be given in the same order as the covariate names (defaults to ‘NULL’).
<code>include.x.instr</code>	A logical variable that allows to include additional IV-type instruments (i.e., include covariates which are used as instruments but for which no parameters are estimated; defaults to ‘FALSE’).
<code>varname.reg.instr</code>	One or more character strings denoting the covariate(s) in the data set treated as instruments in IV-estimation (defaults to ‘NULL’).
<code>include.x.toInstr</code>	A logical variable that allows to instrument covariates (i.e., include covariates for which parameters are estimated but which are not employed in estimation; defaults to ‘FALSE’).

<code>varname.reg.toInstr</code>	One or more character strings denoting the covariates in the data set to be instrumented (i.e., covariates which are used as instruments but for which no parameters are estimated; defaults to ‘FALSE’).
<code>fur.con</code>	A logical variable indicating whether further control variables (covariates) are included (defaults to ‘FALSE’).
<code>fur.con.diff</code>	A logical variable indicating whether to include further control variables in equations from differences (defaults to ‘NULL’).
<code>fur.con.lev</code>	A logical variable indicating whether to include further control variables in equations from level (defaults to ‘NULL’).
<code>varname.reg.fur</code>	One or more character strings denoting covariate(s) in the data set to treat as further controls (defaults to ‘NULL’).
<code>lagTerms.reg.fur</code>	One or more integers indicating the number of lags of the further controls to be used as explanatory variables. One integer per further control needs to be given in the same order as the corresponding variable names (defaults to ‘NULL’).
<code>include.dum</code>	A logical variable indicating whether dummy variables for the time periods are included (defaults to ‘FALSE’).
<code>dum.diff</code>	A logical variable indicating whether dummy variables are included in the equations in first differences (defaults to ‘FALSE’).
<code>dum.lev</code>	A logical variable indicating whether dummy variables are included in the equations in levels (defaults to ‘TRUE’).
<code>varname.dum</code>	One or more character strings from which time dummies should be derived (can be different from varname.t; defaults to ‘NULL’).
<code>col_tol</code>	A numeric variable in [0,1] indicating the absolute correlation threshold for collinearity checks (columns are omitted when pairwise correlations are above the threshold; defaults to 0.65).
<code>w.mat</code>	One of the character strings c(“iid.err”, “identity”, “zero.cov”) indicating the type of weighting matrix to use (defaults to “iid.err”).
<code>w.mat.stata</code>	A logical variable that slightly adjusts the weighting matrix according to the Stata function xtdpdgmm (defaults to ‘FALSE’).
<code>std.err</code>	One of the character strings c(“corrected”, “unadjusted”). The former option computes Windmeijer (2005) corrected standard errors (defaults to “corrected”).
<code>estimation</code>	One of the character strings c(“onestep”, “twostep”, “iterative”). Denotes the number of iterations of the parameter procedure (defaults to “twostep”).
<code>max.iter</code>	An integer indicating the maximum number of iterations (defaults to ‘NULL’; if estimation is set to “iterative”, ‘max.iter’ defaults to 100).
<code>iter.tol</code>	A numeric variable in [0,1] indicating the tolerance for determining convergence of the iterative approach (defaults to ‘NULL’; if estimation is set to “iterative”, ‘iter.tol’ defaults to 0.01).
<code>inst.thresh</code>	An integer denoting whether to limit the total number of instruments to be used in estimation (defaults to ‘NULL’).

opt.meth	A character string denoting the numerical optimization procedure. When no nonlinear moment conditions are employed in estimation, closed form estimates can be computed by setting the argument to "none" (defaults to "BFGS"; for details on the further available optimizers see the documentation of package optimx).
hessian	A logical variable indicating if the hessian matrix should be approximated in optimization (defaults to 'FALSE').
optCtrl	A list of arguments that are passed to optimx . For details on the arguments and the available options see the package documentation.
custom.start.val	A logical variable indicating whether prespecified starting values for the parameters are provided by the user (defaults to 'FALSE'; if set to 'TRUE', starting values need to be provided via argument 'start.val').
start.val	A vector of numeric variables denoting the starting values for the parameter vector for numeric optimization (defaults to 'NULL').
start.val.lo	A numeric variable denoting the lower limit for drawing starting values with uniform density (defaults to -1; ignored if 'custom.start.val' is set to 'TRUE').
start.val.up	A numeric variable denoting the upper limit for drawing starting values with uniform density (defaults to 1; ignored if 'custom.start.val' is set to 'TRUE').
seed.input	An integer used as seed for drawing starting values (defaults to 42; required if custom.start.val is set to 'FALSE').

Details

The function estimates a linear dynamic panel data model of the form

$$y_{i,t} = y_{i,t-1}\rho_1 + \mathbf{x}'_{i,t}\boldsymbol{\beta} + a_i + \varepsilon_{i,t}$$

where $y_{i,t-1}$ is the lagged dependent variable, ρ_1 is the lag parameter, $\mathbf{x}_{i,t}$ are further covariates, $\boldsymbol{\beta}$ are the corresponding parameters, a_i is an unobserved individual specific effect, and $\varepsilon_{i,t}$ is an idiosyncratic remainder component. The model structure accounts for unobserved individual specific heterogeneity and dynamics. Note that the specification given above is simplified for illustratory purposes and more general lag structures are allowed in pdynmc.

Estimation of the model parameters in pdynmc is based on moment conditions with the generalized method of moments (GMM). Linear dynamic panel data models The moment conditions employed in estimation can be linear and nonlinear in parameters and estimation is carried out iteratively. In case only linear moment conditions are used in estimation, closed form solutions can be for computing parameter estimates – while when nonlinear moment conditions are employed, parameter estimation relies on numerical optimization of the objective function.

'pdynmc' provides an implementation of some of the functionality available in the Stata library xtdpdgmm Kripfganz (2019) and allows for "onestep", "twostep", and "iterative" GMM estimation based on the moment conditions of Holtz-Eakin et al. (1988), Arellano and Bover (1995), and Ahn and Schmidt (1995).

Value

An object of class 'pdynmc' with the following elements:

<code>coefficients</code>	a vector containing the coefficient estimates
<code>data</code>	a list of elements on which computation of the model fit is based
<code>dep.clF</code>	a list of vectors containing the dependent variable for the cross-sectional observations
<code>dat.clF</code>	a list of matrices containing the explanatory variables for the cross-sectional observations
<code>w.mat</code>	a list of weighting matrices for the different estimation steps
<code>H_i</code>	a matrix used to create the weighting matrix for the first estimation step
<code>par.optim</code>	a list of vectors containing the parameter estimates obtained from numerical optimization for the estimation steps
<code>ctrl.optim</code>	a list of control parameters used in numerical optimization for the estimation steps
<code>par.clForm</code>	a list of vectors containing the parameter estimates obtained from the closed form for the estimation steps
<code>iter</code>	a scalar denoting the number of iteration steps carried out to obtain parameter estimates
<code>fitted.values</code>	a list for each estimation step that contains a list of vectors of fitted values for each cross-sectional observation
<code>residuals</code>	a list for each estimation step that contains a list of vectors of residuals for each cross-sectional observation
<code>vcov</code>	a list of matrices containing the variance covariance matrix of the parameter estimates for each estimation step
<code>stderr</code>	a list of vectors containing the standard errors of the parameter estimates for each estimation step
<code>zvalue</code>	a list of vectors containing the z scores for the parameter estimates for each estimation step
<code>pvalue</code>	a list of vectors containing the p-values for the parameter estimates for each estimation step

It has ‘case.names’, ‘coef’, ‘dum.coef’, ‘fitted’, ‘model.matrix’, ‘ninst’, ‘nobs’, ‘optimIn’, ‘plot’, ‘print’, ‘residuals’, ‘summary’, ‘variable.names’, ‘vcov’, and ‘wmat’ methods.

plot.pdynmc*Plot Coefficient Estimates and Corresponding Ranges of Fitted Model.***Description**

`plot.pdynmc` Plot coefficient estimates and corresponding coefficient estimate ranges for objects of class ‘pdynmc’.

Usage

```

## S3 method for class 'pdynmc'
plot(
  x,
  type = "fire",
  include.dum = FALSE,
  include.fur.con = FALSE,
  col.coefRange = 1,
  col.coefInitial = "darkgrey",
  col.coefEst = "royalblue",
  boxplot.coef = FALSE,
  ...
)

```

Arguments

- | | |
|------------------------------|---|
| <code>x</code> | An object of class ‘pdynmc’. The function requires twostep or iterative GMM estimates. |
| <code>type</code> | Whether to plot fitted values against residuals (argument ‘fire’; default) or coefficient ranges (argument ‘coef.range’; this requires twostep or iterative GMM estimates). |
| <code>include.dum</code> | Include estimates of parameters corresponding to time dummies (defaults to ‘FALSE’; requires ‘ <code>type = coef.range</code> ’). |
| <code>include.fur.con</code> | Include estimates of parameters corresponding to further controls (defaults to ‘FALSE’; requires ‘ <code>type = coef.range</code> ’). |
| <code>col.coefRange</code> | Specify color for plotting range of coefficient estimates (defaults to ‘black’; requires ‘ <code>type = coef.range</code> ’). |

```

col.coefInitial      Specify color for plotting initial coefficient estimates (defaults to 'darkgrey'; requires 'type = coef.range').
col.coefEst          Specify color for plotting coefficient estimate (defaults to 'royalblue'; requires 'type = coef.range').
boxplot.coef         Whether to draw boxplots for coefficient estimates (defaults to 'FALSE'); requires iterative GMM with at least 10 iterations and argument 'type = coef.range'. Proceed with caution as this argument is experimental.
...                  further arguments.

```

Value

Plot fitted values against residuals ('type = fire') or coefficient estimates and coefficient estimate ranges ('type = coef.range') for object of class 'pdynmc'. The latter plot requires twostep or iterative GMM estimates.

print.pdynmc*Print Fitted Model Object.***Description**

`print.pdynmc` prints objects of class ‘pdynmc’.

Usage

```

## S3 method for class 'pdynmc'
print(x, digits = max(3, getOption("digits") - 3), ...)

```

Arguments

- x An object of class ‘pdynmc’.
- digits An integer indicating the maximum number of digits to display in the object.
- ... further arguments.

Value

Print objects of class ‘pdynmc’.

`print.summary.pdynmc` *Print Summary of Fitted Model Object.*

Description

`print.summary.pdynmc` prints the summary for objects of class ‘pdynmc’.

Usage

```
## S3 method for class 'summary.pdynmc'
print(
  x,
  digits = max(3,getOption("digits") - 3),
  signif.stars = getOption("show.signif.stars"),
  ...
)
```

Arguments

<code>x</code>	An object of class ‘summary.pdynmc’.
<code>digits</code>	An integer indicating the maximum number of digits to display in the object.
<code>signif.stars</code>	Argument is defined as in options .
<code>...</code>	further arguments.

Value

Print information on objects of class ‘summary.pdynmc’.

residuals.pdynmc*Extract Residuals of Fitted Model.***Description**

`residuals.pdynmc` extracts residuals from an object of class ‘pdynmc’.

Usage

```

## S3 method for class 'pdynmc'
residuals(object, step = object$iter, na.rm = FALSE, ...)

```

Arguments

- object An object of class ‘pdynmc’.
 step An integer denoting the iteration step for which fitted values are extracted (defaults to last iteration step used for obtaining parameter estimates).
 na.rm A logical variable indicating whether missing values should be removed from the vector of fitted values (defaults to ‘FALSE’).
 ... further arguments.

Value

Extract residuals from object of class ‘pdynmc’.

strucUPD.plot*Plot on Structure of Unbalanced Panel Data Set.***Description**

strucUPD.plot Plot on cross-section and longitudinal structure of an object of class ‘`data.frame`’ containing an unbalanced panel data set.

Usage

```

strucUPD.plot(
  object,
  i.name = NULL,
  t.name = NULL,
  col.range = c("gold", "darkblue"),
  plot.name = "Unbalanced panel structure",
  ...
)

```

Arguments

<code>object</code>	An object of class ‘ <code>data.frame</code> ’.
<code>i.name</code>	Column name of cross-section identifier.
<code>t.name</code>	Column name of time-series identifier.
<code>col.range</code>	A vector of at least two colors used to visualize the structure of the unbalanced panel data set (defaults to ‘gold’ and ‘darkblue’); must be a valid argument to <code>col2rgb</code> .
<code>plot.name</code>	A vector indicating the title of the plot (defaults to ‘Unbalanced panel structure’).
...	further arguments.

Value

Returns a plot for an unbalanced panel data set contained in an object of class ‘data.frame‘ that visualizes the structure of the data. Cross-section dimension is plotted on the ordinate, longitudinal dimension on the abscissa. Each cross-sectional observation is represented by a bar. Breaks in the bars represent missing longitudinal observations.

Examples

```
## Load data from plm package
if(!requireNamespace("plm", quietly = TRUE)){
  stop("Dataset from package \"plm\" needed for this example.
       Please install the package.", call. = FALSE)
} else{
  data(EmplUK, package = "plm")
  dat <- EmplUK
  dat[,c(4:7)] <- log(dat[,c(4:7)])

## Code example
strucUPD.plot(dat, i.name = "firm", t.name = "year")

set.seed(42)
strucUPD.plot(dat[sample(x = 1:nrow(dat),
  size = floor(0.5*nrow(dat)), replace = FALSE), ],
  i.name = "firm", t.name = "year")
}
```

Description

`summary.pdynmc` generates the summary for objects of class ‘pdynmc‘.

Usage

```
## S3 method for class 'pdynmc'
summary(object, ...)
```

Arguments

- object** An object of class ‘pdynmc’.
... further arguments.

Value

Object of class ‘summary.pdynmc’.

Description

`vcov.pdynmc` extracts variance covariance matrix of the parameter estimates from an object of class ‘pdynmc’.

Usage

```
## S3 method for class 'pdynmc'
vcov(object, step = object$iter, ...)
```

Arguments

- `object` An object of class ‘pdynmc’.
- `step` An integer denoting the iteration step for which fitted values are extracted (defaults to last iteration step used for obtaining parameter estimates).
- `...` further arguments.

Value

Extract variance covariance matrix of the parameter estimates from an object of class ‘pdynmc’.

wald.fct*Wald Test.***Description**

wald.fct computes F test statistics and corresponding p-values for ‘pdynmc‘ objects.

Usage

```
wald.fct(param, object)
```

Arguments

- | | |
|--------|--|
| param | A character string that denotes the null hypothesis. Choices are time.dum (i.e., all time dummies are jointly zero), slope (i.e., all slope coefficients are jointly zero), and all (i.e., all dummies and slope coefficients are jointly zero). |
| object | An object of class ‘pdynmc‘. |

Details

The three available null hypothesis are: All time dummies are jointly zero, all slope coefficients are jointly zero, all times dummies and slope coefficients are jointly zero.

Value

An object of class ‘htest’ which contains the F test statistic and corresponding p-value for the tested null hypothesis.

wmat

Extract Weighting Matrix of Fitted Model.

Description

wmat is a generic function for extracting the weighting matrix of an object.

Usage

```
wmat(object, ...)
```

Arguments

object	An object for which the weighting matrix is desired.
...	further arguments.

Value

Extract weighting matrix from an object.
