

Package ‘popsom’

July 22, 2020

Version 4.3.0

Date 2020-07-22

Title Functions for Constructing and Evaluating Self-Organizing Maps

Maintainer Lutz Hamel <lutzhamel@uri.edu>

Imports som, class, fields, graphics, ggplot2

Description A self-organizing map package with three distinguishing features:

- (1) Automatic cluster centroid detection and visualization using starbursts
- (2) Convergence index, a statistical quality measure based on the linear combination of map embedding and estimated topographic accuracy
- (3) A very efficient stochastic training algorithm based on ideas from tensor algebra.

--------------	-----------

map.build*Build Map***Description**

Constructs a SOM, returns an object of class 'map'.

Usage

```
map.build(data,labels=NULL,xdim=10,ydim=5,alpha=0.3,train=1000,algorithm="vsom")
```

Arguments

data	a dataframe where each row contains an unlabeled training instance.
labels	a vector or dataframe with one label for each observation in data.
xdim	the x-dimension of the map. (default=10)
ydim	the y-dimension of the map. (default=5)
alpha	the learning rate, should be a positive non-zero real number. (default=0.3)
train	the number of training iterations. (default=1000)
algorithm	training algorithm selection switch. (default="vsom")

Value

object of type 'map'.

Note

You have a choice of training algorithms:

- "vsom" - vectorized stochastic learning, this is a highly optimized version of stochastic training written in FORTRAN 9X.
- "som" - the traditional stochastic learning algorithm written in C++/TNT.
- "batchsom" - batch version of the SOM training algorithm, written in C.
- "experimental" - experimental implementation of vectorized stochastic learning implemented directly in R.

Note

If your training data does not have any labels you can construct a simple label vector as follows:
`labels <- 1:nrow(training.data)`. If you let the labels default to the NULL value then no labels will be shown in the map visualization.

Author(s)

Lutz Hamel, Benjamin Ott, Gregory Breard

Examples

```
data(iris)

## set data frame and labels
df <- subset(iris,select=-Species)
labels <- subset(iris,select=Species)

## build a map
m <- map.build(df, labels, xdim=15, ydim=10, train=1000)
```

map.convergence

*SOM Quality Assessment***Description**

Evaluate the quality of a SOM using embedding and estimated topographic accuracy.

Usage

```
map.convergence(map,conf.int=.95,k=50,verb=FALSE,ks=TRUE)
```

Arguments

map	an object of type 'map'.
conf.int	is the confidence interval of the quality assessment (default 95%)
k	number of samples to use in the computation of the estimated topographical accuracy (default=50)
verb	if true reports the two convergence components separately, otherwise it will report a linear combination of the two indices (default=FALSE)
ks	if true uses the Kolmogorov-Smirnov convergence test otherwise a convergence test based on variance and means is performed (default=TRUE)

Value

A single value or a pair of values: 1) embedding accuracy 2) estimated topographic accuracy.

Author(s)

Lutz Hamel

References

"SOM Quality Measures: A Statistical Approach," Lutz Hamel, WSOM16, 2016.

Examples

```
data(iris)

## set data frame and labels
df <- subset(iris, select=-Species)
labels <- subset(iris, select=Species)

## build a map
m <- map.build(df, labels, xdim=15, ydim=10, train=1000)

## map quality
map.convergence(m)
```

`map.embed`

Map Embedding Accuracy

Description

Evaluates how well a map models the underlying training data distribution.

Usage

```
map.embed(map, conf.int = 0.95, verb=FALSE, ks=FALSE)
```

Arguments

<code>map</code>	an object of type 'map'.
<code>conf.int</code>	the confidence interval of the embedding test (default 95 percent).
<code>verb</code>	a switch controlling the structure of the output value (default=FALSE)
<code>ks</code>	if true uses the Kolmogorov-Smirnov convergence test otherwise a convergence test based on variance and means is performed (default=FALSE)

Value

The embedding accuracy of the map. If the switch `verb=TRUE` then a vector of the individual feature embedding accuracies are returned.

Note

`map.embed` has been deprecated as of this release (version 4.3.0) of the `popsom` package for R. `map.embed` has also been flagged for removal upon release of the next version of the `popsom` package.

The use of `map.convergence`, also available in the `popsom` package, with the argument '`verb = True`' is now encouraged to explicitly compute the embedding accuracy of maps in future `popsom` package releases.

Examples

```
data(iris)

## set data frame and labels
df <- subset(iris,select=-Species)
labels <- subset(iris,select=Species)

## build a map
m <- map.build(df, labels, xdim=15, ydim=10, train=1000)

## display the embedding accuracy of the map
map.embed(m)

## display the embedding accuracies of the individual features
data.frame(names(df),map.embed(m,verb=TRUE))
```

map.marginal

Plot Marginal Distribution

Description

Generate a plot that shows the marginal probability distribution of the neurons and data.

Usage

```
map.marginal(map,marginal)
```

Arguments

- | | |
|----------|--|
| map | an object of type 'map'. |
| marginal | is the name of a training data frame dimension or index. |

Author(s)

Lutz Hamel, Robert Tatoian

Examples

```
data(iris)

## set data frame and labels
df <- subset(iris,select=-Species)
labels <- subset(iris,select=Species)

## build a map
m <- map.build(df, labels, xdim=15, ydim=10, train=1000)

## display marginal distribution of dimension 1
map.marginal(m,1)
```

map.neuron

Return a Map Neuron

Description

Returns the contents of a neuron at (x,y) on the map as a vector.

Usage

```
map.neuron(map, x, y)
```

Arguments

- | | |
|-----|-----------------------------|
| map | an object of type 'map'. |
| x | map x-coordinate of neuron. |
| y | map y-coordinate of neuron. |

Value

A vector representing the neuron.

Author(s)

Lutz Hamel

Examples

```
data(iris)

## set data frame and labels
df <- subset(iris,select=-Species)
labels <- subset(iris,select=Species)

## build a map
m <- map.build(df, labels, xdim=15, ydim=10, train=1000)
```

```
## display the neuron at position (1,1)
map.neuron(m, 1, 1)
```

map.projection*Map Projection*

Description

Prints the association of labels with map elements.

Usage

```
map.projection(map)
```

Arguments

map an object of type 'map'.

Value

a dataframe containing the projection onto the map for each training observation.

Note

`map.projection` has been deprecated as of this release (version 4.3.0) of the `popsom` package for R. `map.projection` has also been flagged for removal upon release of the next version of the `popsom` package.

Author(s)

Lutz Hamel, Benjamin Ott, Gregory Breard

Examples

```
data(iris)

## set data frame and labels
df <- subset(iris, select=-Species)
labels <- subset(iris, select=Species)

## build a map
m <- map.build(df, labels, xdim=15, ydim=10, train=1000)

## display the label association for the map
map.projection(m)
```

map.significance *Compute Significance Of Features*

Description

Computes the relative significance of each feature and plots it.

Usage

```
map.significance(map, graphics = TRUE, feature.labels = TRUE)
```

Arguments

<code>map</code>	an object of type 'map'.
<code>graphics</code>	a switch that controls whether a plot is generated or not.
<code>feature.labels</code>	a switch to allow the plotting of feature names vs feature indices.

Value

if `graphics=FALSE` a vector containing the significance for each feature is returned.

Note

We use a Bayesian approach to compute the relative significance of features based on variance.

Examples

```
data(iris)

## set data frame and labels
df <- subset(iris,select=-Species)
labels <- subset(iris,select=Species)

## build a map
m <- map.build(df, labels, xdim=15, ydim=10, train=1000)

## show the relative feature significance for each feature
data.frame(names(df),map.significance(m,graphics=FALSE))

## display the relative feature significance graphically
map.significance(m)
```

<code>map.starburst</code>	<i>Generate Starburst For Map</i>
----------------------------	-----------------------------------

Description

Computes and displays the starburst representation of clusters on a map.

Usage

```
map.starburst(map, explicit = FALSE, smoothing = 2, merge.clusters=FALSE, merge.range=.25)
```

Arguments

<code>map</code>	an object of type 'map'.
<code>explicit</code>	controls the shape of the connected components.
<code>smoothing</code>	controls the smoothing level of the map display (NULL, 0, >0).
<code>merge.clusters</code>	is a switch that controls if the starburst clusters are merged together
<code>merge.range</code>	is a range that is used as a percentage of a certain distance in the code to determine whether components are closer to their centroids or centroids closer to each other.

Examples

```
data(iris)

## set data frame and labels
df <- subset(iris,select=-Species)
labels <- subset(iris,select=Species)

## build a map
m <- map.build(df, labels, xdim=15, ydim=10, train=1000)

## display the starburst for the map
map.starburst(m)
```

map.topo*Estimated Topographical Accuracy***Description**

Evaluate the topological quality of a SOM using the estimated topographical accuracy.

Usage

```
map.topo(map,k=50,conf.int = 0.95,verb=FALSE,interval=TRUE)
```

Arguments

map	an object of type 'map'.
k	number of samples to use in the computation of the estimated topographical accuracy (default=50)
conf.int	the confidence interval of the estimated topographical accuracy (default 95 percent).
verb	a switch controlling the structure of the output value (default=FALSE)
interval	a switch that controls whether the confidence interval is computed (default=TRUE)

Value

1) The value of the estimated topographical accuracy. 2) The low value of the confidence interval and the high value of the confidence interval 'conf.int' if interval=TRUE. 3) If verb=TRUE then map.accuracy will return a vector with the accuracies of the individual k samples.

Note

map.topo has been deprecated as of this release (version 4.3.0) of the popsom package for R. map.topo has also been flagged for removal upon release of the next version of the popsom package.

The use of map.convergence, also available in the popsom package, with the argument 'verb = True' is now encouraged to explicitly compute the estimated topographic accuracy of maps in future popsom package releases.

Examples

```
data(iris)

## set data frame and labels
df <- subset(iris, select=-Species)
labels <- subset(iris, select=Species)

## build a map
m <- map.build(df, labels, xdim=15, ydim=10, train=1000)

## display estimated topographical accuracy of the map
map.topo(m)
```

Description

These functions have been deprecated as of this release (version 4.3.0) of the *popsom* package for R.

Said functions have been flagged for removal upon release of the next version of the *popsom* package.

Details

The functions currently included in the *popsom* that have been deprecated are as follows:

- 1) `map.embed()`
 - (NOTE: To explicitly compute the embedding accuracy of maps in future *popsom* package releases, call `map.convergence()` with the argument ‘verb = True’)
- 2) `map.topo()`
 - (NOTE: To explicitly compute the estimated topographic accuracy of maps in future *popsom* package releases, call `map.convergence()` with the argument ‘verb = True’)
- 3) `map.projection()`
