# Package 'pwr2ppl' 

June 12, 2019

## Type Package

Title Power Analyses for Common Designs (Power to the People)
Version 0.1.1
Author Chris Aberson
Maintainer Chris Aberson [cla18@humboldt.edu](mailto:cla18@humboldt.edu)
Description Statistical power analysis for designs including t-tests, correlations, multiple regression, ANOVA, mediation, and logistic regression. Functions accompany Aberson (2019) [doi:10.4324/9781315171500](doi:10.4324/9781315171500).

Compute Power for One or Two Factor ANCOVA with a single covariate Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute Power for One or Two Factor ANCOVA with a single covariate Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

$$
\begin{aligned}
& \text { anc(m1.1, m2.1, m1.2, m2.2, m1.3 = NULL, m2.3 = NULL, m1.4 = NULL, } \\
& \text { m2.4 }=\text { NULL, s1.1 = NULL, s2.1 = NULL, s1.2 = NULL, } \\
& \text { s2.2 = NULL, s1.3 = NULL, s2.3 = NULL, s1.4 = NULL, } \\
& \text { s2.4 = NULL, r, s = NULL, alpha }=0.05 \text {, factors, } n \text { ) }
\end{aligned}
$$

## Arguments

| $m 1.1$ | Cell mean for First level of Factor A, First level of Factor B |
| :--- | :--- |
| $m 2.1$ | Cell mean for Second level of Factor A, First level of Factor B |
| $m 1.2$ | Cell mean for First level of Factor A, Second level of Factor B |
| $m 2.2$ | Cell mean for Second level of Factor A, Second level of Factor B |
| $m 1.3$ | Cell mean for First level of Factor A, Third level of Factor B |
| $m 2.3$ | Cell mean for Second level of Factor A, Third level of Factor B |
| $m 1.4$ | Cell mean for First level of Factor A, Fourth level of Factor B |
| $m 2.4$ | Cell mean for Second level of Factor A, Fourth level of Factor B |
| $s 1.1$ | Cell standard deviation for First level of Factor A, First level of Factor B |
| $s 2.1$ | Cell standard deviation for Second level of Factor A, First level of Factor B |
| $s 1.2$ | Cell standard deviation for First level of Factor A, Second level of Factor B |
| $s 2.2$ | Cell standard deviation for Second level of Factor A, Second level of Factor B |
| $s 1.3$ | Cell standard deviation for First level of Factor A, Third level of Factor B |
| $s 2.3$ | Cell standard deviation for Second level of Factor A, Third level of Factor B |
| $s 1.4$ | Cell standard deviation for First level of Factor A, Fourth level of Factor B |
| $s 2.4$ | Cell standard deviation for Second level of Factor A, Fourth level of Factor B |
| $r$ | Correlation between covariate and dependent variable. |
| $s$ | Overall standard deviation. Sets all cell sds equal |
| alpha | Type I error (default is .05) |
| factors | Number of factors (1 or 2) |
| $n$ | Sample Size per cell |

## Value

Power for One or Two Factor ANCOVA with a single covariate

## Examples

```
anc(m1.1=.85,m2.1=2.5, s1.1 = 1.7, s2.1=1,
m1.2=0.85, m2.2= 2.5, s1.2 = 1.7, s2.2=1,
m1.3=0.0,m2.3=2.5, s1.3 = 1.7, s2.3=1,
m1.4=0.6, m2.4 = 2.5, s1.4 = 1.7, s2.4=1, r=0.4,
n=251, factors =2)
```

anova1f_3

Compute power for a One Factor ANOVA with three levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a One Factor ANOVA with three levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

anova1f_3(m1 = NULL, m2 = NULL, m3 = NULL, s1 = NULL, s2 = NULL, s3 = NULL, n1 = NULL, n2 = NULL, n3 = NULL, alpha = 0.05)

## Arguments

| m 1 | Mean of first group |
| :--- | :--- |
| m 2 | Mean of second group |
| m 3 | Mean of third group |
| s 1 | Standard deviation of first group |
| s2 | Standard deviation of second group |
| s3 | Standard deviation of third group |
| n1 | Sample size for first group |
| n2 | Sample size for second group |
| n3 | Sample size for third group |
| alpha | Type I error (default is .05) |

## Value

Power for the One Factor ANOVA

## Examples

anova1f_3(m1=80, m2 $=82, m 3=82, s 1=10, s 2=10, s 3=10, n 1=60, n 2=60, n 3=60)$

| anova1f_3c | Compute power for a One Factor ANOVA with three levels and con- <br> trasts. Takes means, sds, and sample sizes for each group. Alpha is |
| :--- | :--- |
| . 05 by default, alternative values may be entered by user |  |

## Description

Compute power for a One Factor ANOVA with three levels and contrasts. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

```
anova1f_3c(m1 = NULL, m2 = NULL, m3 = NULL, s1 = NULL, s2 = NULL,
    s3 = NULL, n1 = NULL, n2 = NULL, n3 = NULL, alpha = 0.05,
    c1 = 0, c2 = 0, c3 = 0)
```

## Arguments

| m 1 | Mean of first group |
| :--- | :--- |
| m 2 | Mean of second group |
| m 3 | Mean of third group |
| s 1 | Standard deviation of first group |
| s 2 | Standard deviation of second group |
| s 3 | Standard deviation of third group |
| n 1 | Sample size for first group |
| n 2 | Sample size for second group |
| n 3 | Sample size for third group |
| alpha | Type I error (default is .05) |
| c1 | Weight for Contrast 1 (default is 0) |
| c2 | Weight for Contrast 2 (default is 0) |
| c3 | Weight for Contrast 3 (default is 0) |

## Value

Power for the One Factor ANOVA

## Examples

$$
\begin{aligned}
& \text { anova1f } \_3 c(m 1=80, m 2=82, m 3=82, s 1=10, s 2=10, s 3=10 \\
& n 1=60, \mathrm{n} 2=60, \mathrm{n} 3=60, \mathrm{c} 1=2, \mathrm{c} 2=-1, \mathrm{c} 3=-1, \text { alpha }=.05)
\end{aligned}
$$

## Description

Compute power for a One Factor Between Subjects ANOVA with four levels Takes means, sds, and sample sizes for each group

## Usage

anova1f_4(m1 = NULL, m2 = NULL, m3 = NULL, m4 = NULL, s1 = NULL, s2 $=$ NULL, s3 = NULL, s4 = NULL, n1 = NULL, n2 = NULL, n3 $=$ NULL, $n 4=$ NULL, alpha $=0.05$ )

## Arguments

| $m 1$ | Mean of first group |
| :--- | :--- |
| $m 2$ | Mean of second group |
| $m 3$ | Mean of third group |
| $m 4$ | Mean of fourth group |
| $s 1$ | Standard deviation of first group |
| s2 | Standard deviation of second group |
| s3 | Standard deviation of third group |
| s4 | Standard deviation of forth group |
| n1 | Sample size for first group |
| n2 | Sample size for second group |
| n3 | Sample size for third group |
| n4 | Sample size for fourth group |
| alpha | Type I error (default is .05) |

## Value

Power for the One Factor Between Subjects ANOVA

## Examples

```
anova1f_4(m1=80, m2=82, m3=82, m4=86, s1=10, s2=10, s3=10,
s4=10, n1=60, n2=60, n3=60, n4=60)
```

```
anova1f_4c
```

Compute power for a One Factor ANOVA with four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a One Factor ANOVA with four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

anova1f_4c(m1 = NULL, m2 = NULL, m3 = NULL, m4 = NULL, s1 = NULL, $\mathrm{s} 2=$ NULL, $\mathrm{s} 3=$ NULL, $\mathrm{s} 4=$ NULL, $\mathrm{n} 1=$ NULL, $\mathrm{n} 2=$ NULL, $\mathrm{n} 3=$ NULL, $\mathrm{n} 4=$ NULL, alpha $=0.05, \mathrm{c} 1=0, \mathrm{c} 2=0, \mathrm{c} 3=0$, c4 $=0$ )

## Arguments

| $m 1$ | Mean of first group |
| :--- | :--- |
| $m 2$ | Mean of second group |
| $m 3$ | Mean of third group |
| $m 4$ | Mean of fourth group |
| $s 1$ | Standard deviation of first group |
| s2 | Standard deviation of second group |
| s3 | Standard deviation of third group |
| s4 | Standard deviation of forth group |
| n1 | Sample size for first group |
| n2 | Sample size for second group |
| n3 | Sample size for third group |
| n4 | Sample size for fourth group |
| alpha | Type I error (default is .05) |
| c1 | Weight for Contrast 1 (default is 0) |
| c2 | Weight for Contrast 2 (default is 0) |
| c3 | Weight for Contrast 3 (default is 0) |
| c4 | Weight for Contrast 4 (default is 0) |

## Examples

```
anova1f_4c(m1=80, m2=82, m3=82, m4=86, s1=10, s2=10,
s3=10, s4=10, n1=60, n2=60, n3=60, n4=60,
c1=1, c2=1, c3=-1, c4=-1, alpha=.05)
anova1f_4c(m1=80, m2=82, m3=82, m4=86, s1=10, s2=10,
s3=10, s4=10, n1=60, n2=60, n3=60, n4=60,
c1=1, c2=-1, c3=-0, c4=0, alpha=.05)
anova1f_4c(m1=80, m2=82, m3=82, m4=86, s1=10, s2=10,
s3=10, s4=10, n1=60, n2=60, n3=60, n4=60,
c1=0, c2=0, c3=1, c4=-1, alpha=.05)
#'@return Power for the One Factor ANOVA
```

```
anova2x2
```

Compute power for a Two by Two Between Subjects ANOVA. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a Two by Two Between Subjects ANOVA. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

anova2x2(m1.1 = NULL, m1.2 = NULL, m2.1 = NULL, m2.2 = NULL, s1.1 = NULL, s1.2 = NULL, s2.1 = NULL, s2.2 = NULL, $\mathrm{n} 1.1=$ NULL, n1.2 = NULL, n2.1 = NULL, n2.2 = NULL, alpha $=0.05$, all = "OFF")

## Arguments

m1. 1
m1. 2
m2.1 Cell mean for Second level of Factor A, First level of Factor B
m2.2 Cell mean for Second level of Factor A, Second level of Factor B
s1.1 Cell standard deviation for First level of Factor A, First level of Factor B
s1.2 Cell standard deviation for First level of Factor A, Second level of Factor B
s2.1 Cell standard deviation for Second level of Factor A, First level of Factor B
s2.2 Cell standard deviation for Second level of Factor A, Second level of Factor B
n1.1 Cell sample size for First level of Factor A, First level of Factor B
n1.2 Cell sample size for First level of Factor A, Second level of Factor B
n2.1 Cell sample size for Second level of Factor A, First level of Factor B
n2.2 Cell sample size for Second level of Factor A, Second level of Factor B
alpha Type I error (default is .05)
all Power(ALL) - Power for detecting all predictors in the model at once (default is "OFF")

## Value

Power for the One Factor ANOVA

## Examples

```
anova2x2(m1.1=0.85,m1.2=0.85, m2.1=0.00, m2.2=0.60,
s1.1=1.7, s1.2=1.7, s2.1=1.7, s2.2=1.7,
n1.1=100, n1.2=100, n2.1=100, n2.2=100, alpha=.05)
anova2x2(m1.1=0.85, m1.2=0.85, m2.1=0.00, m2.2=0.60,
s1.1=1.7, s1.2=1.7, s2.1=1.7, s2.2=1.7,
n1.1=100, n1.2=100, n2.1=100, n2.2=100,
alpha=.05, all="ON")
```

```
anova2x2_se
```

Compute power for Simple Effects in a Two by Two Between Subjects ANOVA with two levels for each factor. Takes means, sds, and sample sizes for each group. Alpha is . 05 by default, alternative values may be entered by user

## Description

Compute power for Simple Effects in a Two by Two Between Subjects ANOVA with two levels for each factor. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

anova2x2_se(m1.1 = NULL, m1.2 = NULL, m2.1 = NULL, m2.2 = NULL, s1.1 = NULL, s1.2 = NULL, s2.1 = NULL, s2.2 = NULL, n1.1 = NULL, n1.2 = NULL, n2.1 = NULL, n2.2 = NULL, alpha $=0.05$ )

## Arguments

m1.1 Cell mean for First level of Factor A, First level of Factor B
m1.2 Cell mean for First level of Factor A, Second level of Factor B
m2.1 Cell mean for Second level of Factor A, First level of Factor B
m2.2 Cell mean for Second level of Factor A, Second level of Factor B
s1.1 Cell standard deviation for First level of Factor A, First level of Factor B
s1.2 Cell standard deviation for First level of Factor A, Second level of Factor B
s2.1 Cell standard deviation for Second level of Factor A, First level of Factor B
s2.2 Cell standard deviation for Second level of Factor A, Second level of Factor B
n1.1 Cell sample size for First level of Factor A, First level of Factor B
n1.2 Cell sample size for First level of Factor A, Second level of Factor B

| n 2.1 | Cell sample size for Second level of Factor A, First level of Factor B |
| :--- | :--- |
| n 2.2 | Cell sample size for Second level of Factor A, Second level of Factor B |
| alpha | Type I error (default is .05$)$ examples anova2x2_se $(\mathrm{m} 1.1=0.85, \mathrm{~m} 1.2=0.85, \mathrm{~m} 2.1=0.00$, |
|  | $\mathrm{m} 2.2=0.60, \mathrm{~s} 1.1=1.7, \mathrm{~s} 1.2=1.7, \mathrm{~s} 2.1=1.7, \mathrm{~s} 2.2=1.7, \mathrm{n} 1.1=250, \mathrm{n} 1.2=250, \mathrm{n} 2.1=250$, <br> $\mathrm{n} 2.2=250$, alpha $=.05)$ |

## Value

Power for Simple Effects Tests in a Two By Two ANOVA

Chi2x2 Compute power for an Chi Square $2 x 2$ Takes proportions for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for an Chi Square 2 x 2 Takes proportions for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

Chi2x2(r1c1, r1c2, r2c1, r2c2, n, alpha $=0.05$ )

## Arguments

r1c1 Proportion of overall scores in Row 1, Column 1
r1c2 Proportion of overall scores in Row 1, Column 2
r2c1 Proportion of overall scores in Row 2, Column 1
r2c2 Proportion of overall scores in Row 2, Column 2
n
Total sample size
alpha Type I error (default is .05)

## Value

Power for $2 \times 2$ Chi Square

## Examples

Chi2x2(r1c1=.28,r1c2=.22,r2c1=.38,r2c2=.12, n=100)

Compute power for an Chi Square $2 x 3$ Takes proportions for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for an Chi Square $2 \times 3$ Takes proportions for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

Chi2X3(r1c1, r1c2, r1c3, r2c1, r2c2, r2c3, n, alpha = 0.05)

## Arguments

r1c1 Proportion of overall scores in Row 1, Column 1
r1c2 Proportion of overall scores in Row 1, Column 2
r1c3 Proportion of overall scores in Row 1, Column 3
r2c1 Proportion of overall scores in Row 2, Column 1
r2c2 Proportion of overall scores in Row 2, Column 2
r2c3 Proportion of overall scores in Row 2, Column 3
$\mathrm{n} \quad$ Total sample size
alpha Type I error (default is .05)

## Value

Power for $2 \times 3$ Chi Square

## Examples

```
Chi2X3(r1c1=.25,r1c2=.25,r1c3=.10, r2c1=.10,r2c2=.25,r2c3=.05,n=200)
```

Compute power for Chi Square Based on Effect Size Takes phi, degrees of freedom, and a range of sample sizes. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for Chi Square Based on Effect Size Takes phi, degrees of freedom, and a range of sample sizes. Alpha is .05 by default, alternative values may be entered by user

## Usage

ChiES(phi, df, nlow, nhigh, by = 1, alpha = 0.05)

## Arguments

| phi | phi coefficient (effect size for 2 x 2 ) |
| :--- | :--- |
| df | degrees of freedom |
| nlow | starting sample size |
| nhigh | ending sample size |
| by | Incremental increase in sample (e.g. nlow $=10$, nhigh $=24$, by $=2$, produces <br>  <br> estimates of 10,12, and 14$)$ <br> alpha |
|  | Type I error (default is .05 ) |

## Value

Power for Chi Square Based on Effect Size

## Examples

ChiES (phi=. 3, df=1, nlow=10, nhigh=200,by=10, alpha = .01)

ChiGOF
Compute power for an Chi Square Goodness of Fit Takes proportions for up to six group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for an Chi Square Goodness of Fit Takes proportions for up to six group. Alpha is .05 by default, alternative values may be entered by user

## Usage

ChiGOF (groups, po1, po2, po3 $=$ NULL, po4 $=$ NULL, po5 $=$ NULL, po6 $=$ NULL, $n$, alpha $=0.05$ )

## Arguments

groups Number of groups
po1 Proportion observed Group 1
po2 Proportion observed Group 2
po3 Proportion observed Group 3
po4 Proportion observed Group 4
po5 Proportion observed Group 5
po6 Proportion observed Group 6
n Total sample size
alpha Type I error (default is .05)

## Value

Power for Chi Square Goodness of Fit

## Examples

```
ChiGOF(po1=.25, po2=.20, po3=.20, po4=.35, groups=4,n=100)
```

```
corr
```

Compute power for Pearson's Correlation Takes correlation and range of values

## Description

Compute power for Pearson's Correlation Takes correlation and range of values

## Usage

$\operatorname{corr}(r$, nlow, nhigh, alpha $=0.05$, tails $=2$, by $=1$ )

## Arguments

| $r$ | Correlation |
| :--- | :--- |
| nlow | Starting sample size |
| nhigh | Ending sample size |
| alpha | Type I error (default is .05) |
| tails | one or two-tailed tests (default is 2) |
| by | Incremental increase in sample size from low to high |

## Value

Power for Pearson's Correlation

## Examples

$\operatorname{corr}(r=.30$, nlow=60, nhigh=100, by=2)

```
depb
```

Power for Comparing Dependent Coefficients in Multiple Regression with Two or Three Predictors Requires correlations between all variables as sample size. Means, sds, and alpha are option. Also computes Power(All)

## Description

Power for Comparing Dependent Coefficients in Multiple Regression with Two or Three Predictors Requires correlations between all variables as sample size. Means, sds, and alpha are option. Also computes Power(All)

## Usage

depb (ry1, ry2, ry3 = NULL, r12, r13 = NULL, r23 = NULL, $n=$ NULL, alpha $=0.05$ )

## Arguments

| ry1 | Correlation between DV (y) and first predictor (1) |
| :--- | :--- |
| ry2 | Correlation between DV (y) and second predictor (2) |
| ry3 | Correlation between DV (y) and third predictor (3) |
| r12 | Correlation between first (1) and second predictor (2) |
| r13 | Correlation between first (1) and third predictor (3) |
| r23 | Correlation between second (2) and third predictor (3) |
| n | Sample size |
| alpha | Type I error (default is .05) |

## Value

Power for Comparing Dependent Coefficients in Multiple Regression with Two or Three Predictors

## Examples

$\operatorname{depb}(r y 1=.40, r y 2=.40, r y 3=-.40, r 12=-.15, r 13=-.60, r 23=.25, \mathrm{n}=110$, alpha=.05)
depcorr0 Compute Power for Comparing Two Dependent Correlations, No Variables in Common Takes correlations and range of values. First variable in each pair is termed predictor, second is $D V$

## Description

Compute Power for Comparing Two Dependent Correlations, No Variables in Common Takes correlations and range of values. First variable in each pair is termed predictor, second is DV

## Usage

depcorr0(r12, rxy, r1x, r1y, r2x, r2y, nlow, nhigh, alpha = 0.05, tails $=2$, by $=1$ )

## Arguments

| r12 | Correlation between the predictor and DV (first set of measures) |
| :--- | :--- |
| rxy | Correlation between the predictor and DV (second set of measures) |
| r1y | Correlation between the predictor (first measure) and the predictor variable (first <br> measure) |
| r2x | Correlation between the predictor (first measure) and the dependent variable <br> (second measure) |
| r2y | Correlation between the DV (first measure) and the predictor variable (first mea- <br> sure) |
| nlow | Correlation between the DV (first measure) and the dependent variable (second <br> measure) |
| nhigh | Starting sample size |
| alpha | Ending sample size <br> tails |
| Type I error (default is .05) |  |$\quad$| one or two-tailed tests (default is 2) |
| :--- |

## Value

Power for Comparing Two Dependent Correlations, No Variables in Common

## Examples

depcorr0(r12=.4,rxy=.7,r1x=.3,r1y=.1,r2x=.45,r2y=.35, nlow=20,nhigh=200,by=10, tails=2)
depcorr1 Compute Power for Comparing Two Dependent Correlations, One Variable in Common Takes correlations and range of values

## Description

Compute Power for Comparing Two Dependent Correlations, One Variable in Common Takes correlations and range of values

## Usage

depcorr1(r1y, r2y, r12, nlow, nhigh, alpha $=0.05$, tails $=2$, by $=1$ )

## Arguments

| r1y | Correlation between the first predictor and the dependent variable |
| :--- | :--- |
| r2y | Correlation between the second predictor and the dependent variable |
| r12 | Correlation between the first predictor and the second predictor |
| nlow | Starting sample size |
| nhigh | Ending sample size |
| alpha | Type I error (default is .05) |
| tails | one or two-tailed tests (default is 2 ) |
| by | Incremental increase in sample size from low to high |

## Value

Power for Comparing Dependent Correlations, One Variable in Common

## Examples

depcorr1 (r1y=.3,r2y=.04,r12 = .2, nlow=100,nhigh=300,by=10, tails=2)

$$
\text { d_prec } \quad \text { Compute Precision Analyses for Standardized Mean Differences }
$$

## Description

Compute Precision Analyses for Standardized Mean Differences

## Usage

d_prec (d, nlow, nhigh, propn1 = 0.5, ci $=0.95$, tails $=2$, by $=1$ )

## Arguments

d
nlow

## nhigh

propn1 Proportion in First Group
ci Type of Confidence Interval (e.g., .95)
tails number of tails for test (default is 2)
by Incremental increase in sample (e.g. nlow $=10$, nhigh $=24$, by $=2$, produces estimates of 10,12 , and 14)

## Value

Precision Analyses for Standardized Mean Differences

## Examples

d_prec (d=.4, nlow=100, nhigh=2000, propn1=.5, ci=.95, by=100)

indb | Power for Comparing Independent Coefficients in Multiple Regression |
| :--- |
| with Two or Three Predictors Requires correlations between all vari- |
| ables as sample size. Means, sds, and alpha are option. Also computes |
| Power(All) |

## Description

Power for Comparing Independent Coefficients in Multiple Regression with Two or Three Predictors Requires correlations between all variables as sample size. Means, sds, and alpha are option. Also computes Power(All)

## Usage

indb(ry1_1, ry2_1, ry3_1 = NULL, r12_1, r13_1 = NULL, r23_1 = NULL,
n1, ry1_2, ry2_2, ry3_2 = NULL, r12_2, r13_2 = NULL, r23_2 = NULL,
n2, alpha = 0.05)

## Arguments

ry1_1 Correlation between DV (y) and first predictor (1), first test
ry2_1 Correlation between DV (y) and second predictor (2), first test
ry3_1 Correlation between DV (y) and third predictor (3), first test
r12_1 Correlation between first (1) and second predictor (2), first test
r13_1 Correlation between first (1) and third predictor (3), first test
r23_1 Correlation between second (2) and third predictor (3), first test

| n1 | Sample size first test |
| :--- | :--- |
| ry1_2 | Correlation between DV (y) and first predictor (1), second test |
| ry2_2 | Correlation between DV (y) and second predictor (2), second test |
| ry3_2 | Correlation between DV (y) and third predictor (3), second test |
| r12_2 | Correlation between first (1) and second predictor (2), second test |
| r13_2 | Correlation between first (1) and third predictor (3), second test |
| r23_2 | Correlation between second (2) and third predictor (3), second test |
| n2 | Sample size second test |
| alpha | Type I error (default is .05) |

## Value

Power for Comparing Independent Coefficients in Multiple Regression

## Examples

```
indb(ry1_1=.40, ry2_1=.40, ry3_1 =-.40, r12_1=-.15,r13_1=-.60, r23_1=.25,
ry1_2=.40, ry2_2=.10, ry3_2 =-.40, r12_2=-.15,r13_2=-.60, r23_2=.25,
n1=50,n2=50, alpha=.05)
```

indcorr Compute Power for Comparing Two Independent Correlations Takes correlations and range of values

## Description

Compute Power for Comparing Two Independent Correlations Takes correlations and range of values

## Usage

indcorr(r1, r2, nlow, nhigh, propn1 = 0.5, alpha = 0.05, tails = 2, by = 1)

## Arguments

$r 1 \quad$ Correlation for Group 1
r2 Correlation for Group 2
nlow Starting sample size
nhigh Ending sample size
propn1 Proportion of sample in first group (default is . 50 for equally size groups)
alpha Type I error (default is .05)
tails one or two-tailed tests (default is 2)
by Incremental increase in sample size from low to high

## Value

Power for Comparing Two Independent Correlations

## Examples

indcorr $(r 1=.3, r 2=.1$, nlow=200, nhigh $=800$, by=50, tails=1)
indR2
Power for Comparing Independent $R 2$ in Multiple Regression with Two or Three Predictors Requires correlations between all variables as sample size. Means, sds, and alpha are option. Also computes Power(All)

## Description

Power for Comparing Independent R2 in Multiple Regression with Two or Three Predictors Requires correlations between all variables as sample size. Means, sds, and alpha are option. Also computes Power(All)

## Usage

indR2(ry1_1, ry2_1, ry3_1 = NULL, r12_1, r13_1 = NULL, r23_1 = NULL, n1, ry1_2, ry2_2, ry3_2 = NULL, r12_2, r13_2 = NULL, r23_2 = NULL, n2, alpha $=0.05$, tails = 2)

## Arguments

ry1_1 Correlation between DV (y) and first predictor (1), first test
ry2_1 Correlation between DV (y) and second predictor (2), first test
ry3_1 Correlation between DV (y) and third predictor (3), first test
r12_1 Correlation between first (1) and second predictor (2), first test
$r$ 13_1 Correlation between first (1) and third predictor (3), first test
r23_1 Correlation between second (2) and third predictor (3), first test
n1 Sample size first test
ry1_2 Correlation between DV (y) and first predictor (1), second test
ry2_2 Correlation between DV (y) and second predictor (2), second test
ry3_2 Correlation between DV (y) and third predictor (3), second test
r12_2 Correlation between first (1) and second predictor (2), second test
r13_2 Correlation between first (1) and third predictor (3), second test
r23_2 Correlation between second (2) and third predictor (3), second test
n2 Sample size second test
alpha Type I error (default is .05)
tails number of tails for test (default is 2)

## Value

Power for Comparing R2 Coefficients in Multiple Regression

## Examples

```
indR2(ry1_1=.40, ry2_1=.40, ry3_1 =-.40, r12_1=-. 15,r13_1=-.60, r23_1=.25,
ry1_2=.40, ry2_2=.10, ry3_2 =-.40, r12_2=-.15, r13_2=-.60, r23_2=.25,
n1=115,n2=115, alpha=.05)
```

    indt
    Compute power for an Independent Samples t-test Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for an Independent Samples t-test Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

indt (m1 = NULL, m2 = NULL, s1 = NULL, s2 = NULL, n1 = NULL, n2 = NULL, alpha = 0.05)

## Arguments

| $m 1$ | Mean of first group |
| :--- | :--- |
| $m 2$ | Mean of second group |
| s1 | Standard deviation of first group |
| s2 | Standard deviation of second group |
| n1 | Sample size for first group |
| n2 | Sample size for second group |
| alpha | Type I error (default is .05) |

## Value

Power for Independent Samples t-test

## Examples

```
indt(m1=22,m2=20, s1=5, s2=5, n1=99,n2=99)
indt(m1=1.3, m2=0, s1=4,s2=1,n1=78,n2=234)
```

1mm1F Compute power for a One Factor Within Subjects Linear Mixed Model with up to four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a One Factor Within Subjects Linear Mixed Model with up to four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

lmm1F(m1, m2, m3 = NA, m4 = NA, s1, s2, s3 = NULL, s4 = NULL, r12, r13 = NULL, r14 = NULL, r23 = NULL, r24 = NULL, r34 = NULL, n, alpha $=0.05$ )

## Arguments

| $m 1$ | Mean of first time point |
| :--- | :--- |
| $m 2$ | Mean of second time point |
| $m 3$ | Mean of third time point |
| $m 4$ | Mean of fourth time point |
| $s 1$ | Standard deviation of first time point |
| $s 2$ | Standard deviation of second time point |
| $s 3$ | Standard deviation of third time point |
| $s 4$ | Standard deviation of forth time point |
| $r 12$ | correlation Time 1 and Time 2 |
| $r 13$ | correlation Time 1 and Time 3 |
| $r 14$ | correlation Time 1 and Time 4 |
| $r 23$ | correlation Time 2 and Time 3 |
| $r 24$ | correlation Time 2 and Time 4 |
| $r 34$ | correlation Time 3 and Time 4 |
| $n$ | Sample size for first group |
| alpha | Type I error (default is .05) |

## Value

Power for the One Factor Within Subjects Linear Mixed Model

## Examples

```
lmm1F(m1 =- . 25,m2=.00,m3=.10, m4=.15, s1=.4, s2=.5, s3=.6, s4=.7,
r12=.50, r13=.30, r14=.15, r23=.5, r24=.30, r34=.50, n=25)
lmm1F(m1 =- . 25,m2=.00,m3=.10,m4=.15, s1=.4, s2=.5, s3=2.5,s4=2.0,
r12=.50, r13=.30, r14=.10, r23=.5, r24=.30, r34=.40, n=100)
```

lmm1Ftrends
Compute power for a One Factor Within Subjects LMM Trends with up to four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a One Factor Within Subjects LMM Trends with up to four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

lmm1Ftrends(m1, m2, m3 = NA, m4 = NA, s1, s2, s3 = NULL, s4 = NULL, r12, r13 = NULL, r14 = NULL, r23 = NULL, r24 = NULL, r34 = NULL, n, alpha = 0.05)

## Arguments

m1 Mean of first time point
m2 Mean of second time point
m3 Mean of third time point
m4 Mean of fourth time point
s1 Standard deviation of first time point
s2 Standard deviation of second time point
s3 Standard deviation of third time point
s4 Standard deviation of forth time point
r12 correlation Time 1 and Time 2
r13 correlation Time 1 and Time 3
r14 correlation Time 1 and Time 4
r23 correlation Time 2 and Time 3
r24 correlation Time 2 and Time 4
r34 correlation Time 3 and Time 4
$\mathrm{n} \quad$ Sample size for first group
alpha Type I error (default is .05)

## Value

Power for the One Factor Within Subjects LMM Trends

## Examples

lmm1Ftrends (m1 $=-.25, \mathrm{~m} 2=-.15, \mathrm{~m} 3=-.05, \mathrm{~m} 4=.05, \mathrm{~s} 1=.4, \mathrm{~s} 2=.5, \mathrm{~s} 3=.6, \mathrm{~s} 4=.7$,
$r 12=.50, r 13=.30, r 14=.15, r 23=.5, r 24=.30, r 34=.50, n=25$ )
lmm1w1b
Compute power for a One Factor Within Subjects and One Factor Between LMM with up to two by four levels (within). Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a One Factor Within Subjects and One Factor Between LMM with up to two by four levels (within). Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

lmm1w1b(m1.1, m2.1, m3.1 = NA, m4.1 = NA, m1.2, m2.2, m3.2 = NA, $\mathrm{m} 4.2=\mathrm{NA}, \mathrm{s} 1.1=\mathrm{NA}, \mathrm{s} 2.1=\mathrm{NA}, \mathrm{s} 3.1=\mathrm{NA}, \mathrm{s} 4.1=\mathrm{NA}$, $\mathrm{s} 1.2=\mathrm{NA}, \mathrm{s} 2.2=\mathrm{NA}, \mathrm{s} 3.2=\mathrm{NA}, \mathrm{s} 4.2=\mathrm{NA}, \mathrm{r} 1.2 \_1=\mathrm{NULL}$, r1.3_1 = NULL, r1.4_1 = NULL, r2.3_1 = NULL, r2.4_1 = NULL,
r3.4_1 = NULL, r1.2_2 = NULL, r1.3_2 = NULL, r1.4_2 = NULL,
r2.3_2 = NULL, r2.4_2 = NULL, r3.4_2 = NULL, r = NULL,
s = NULL, n, alpha = 0.05)

## Arguments

m1. 1
m2.1 Mean of second level Within Factor, 1st level Between Factor
m3.1 Mean of third level Within Factor, 1st level Between Factor
m4.1 Mean of fourth level Within Factor, 1st level Between Factor
m1.2 Mean of first level Within Factor, 2nd level Between Factor
m2.2 Mean of second level Within Factor, 2nd level Between Factor
m3.2 Mean of third level Within Factor, 2nd level Between Factor
m4.2 Mean of fourth level Within Factor, 2nd level Between Factor
s1.1 Standard deviation of first level Within Factor, 1st level Between Factor
s2.1 Standard deviation of second level Within Factor, 1st level Between Factor
s3.1 Standard deviation of third level Within Factor, 1st level Between Factor
s4.1 Standard deviation of forth level Within Factor, 1st level Between Factor

| s1.2 | Standard deviation of first level Within Factor, 2nd level Between Factor |
| :--- | :--- |
| s2.2 | Standard deviation of second level Within Factor, 2nd level Between Factor |
| s3.2 | Standard deviation of third level Within Factor, 2nd level Between Factor |
| s4.2 | Standard deviation of forth level Within Factor, 2nd level Between Factor |
| r1.2_1 | correlation Within Factor Level 1 and Within Factor, Level 2, 1st level Between |
| r1.3_1 | correlation Within Factor Level 1 and Within Factor, Level 3, 1st level Between |
| r1.4_1 | correlation Within Factor Level 1 and Within Factor, Level 4, 1st level Between |
| r2.3_1 | correlation Within Factor Level 1 and Within Factor, Level 3, 1st level Between |
| r2.4_1 | correlation Within Factor Level 1 and Within Factor, Level 4, 1st level Between |
| r3.4_1 | correlation Within Factor Level 1 and Within Factor, Level 4, 1st level Between |
| r1.2_2 | correlation Within Factor Level 1 and Within Factor, Level 3, 2nd level Between |
| r1.3_2 | correlation Within Factor Level 1 and Within Factor, Level 4, 2nd level Between |
| r1.4_2 | correlation Within Factor Level 1 and Within Factor, Level 3, 2nd level Between |
| r2.3_2 | correlation Within Factor Level 1 and Within Factor, Level 4, 2nd level Between |
| r2.4_2 | correlation Within Factor Level 1 and Within Factor, Level 4, 2nd level Between |
| r3.4_2 | sets same correlations between DVs on all factor levels (seriously, just use this) |
| $r$ | sets same standard deviation for factor levels (see comment above) |
| s | Sample size for first group |
| n | Type I error (default is .05) |

## Value

Power for the One Factor Within Subjects and One Factor Between LMM

## Examples

$$
\begin{aligned}
& l m m 1 w 1 b(m 1.1=-.25, m 2.1=0, m 3.1=0.10, m 4.1=.15, \\
& \mathrm{m} 1.2=-.25, \mathrm{~m} 2.2=-.25, \mathrm{~m} 3.2=-.25, \mathrm{~m} 4.2=-.25, \\
& \mathrm{~s} 1.1=.4, \mathrm{~s} 2.1=.5, \mathrm{~s} 3.1=0.6, \mathrm{~s} 4.1=.7, \\
& \mathrm{~s} 1.2=.4, \mathrm{~s} 2.2=.5, \mathrm{~s} 3.2=.6, \mathrm{~s} 4.2=.7, \mathrm{n}=50, \\
& \mathrm{r} 1.2 \_1=.5, \mathrm{r} 1.3 \_1=.3, \mathrm{r} 1.4 \_1=.15, \mathrm{r} 2.3 \_1=.5, r 2.4 \_1=.3, \mathrm{r} 3.4 \_1=.5, \\
& \left.\mathrm{r} 1.2 \_2=.5, \mathrm{r} 1.3 \_2=.3, \mathrm{r} 1.4 \_2=.15, \mathrm{r} 2.3 \_2=.5, \mathrm{r} 2.4 \_2=.3, \mathrm{r} 3.4 \_2=.5\right) \\
& \mathrm{lmm} 1 w 1 \mathrm{~b}(\mathrm{~m} 1.1=--.25, \mathrm{~m} 2.1=0, \mathrm{~m} 3.1=0.10, \mathrm{~m} 4.1=.15, \\
& \mathrm{m} 1.2=-.25, \mathrm{~m} 2.2=-.25, \mathrm{~m} 3.2=-.25, \mathrm{~m} 4.2=-.25, \mathrm{~s}=.4, r=.5, \mathrm{n}=100)
\end{aligned}
$$

lmm2F
Compute power for a Two Factor Within Subjects Using Linear Mixed Models with up to two by four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a Two Factor Within Subjects Using Linear Mixed Models with up to two by four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

| r56 | correlation Factor 2, Level 1 and Factor 2, Level 2 |
| r57 | correlation Factor 2, Level 1 and Factor 2, Level 3 |
| r58 | correlation Factor 2, Level 1 and Factor 2, Level 4 |
| r67 | correlation Factor 2, Level 2 and Factor 2, Level 3 error (default is .05) |
| r68 | correlation Factor 2, Level 2 and Factor 2, Level 4 |
| r78 | sets same correlations between DVs on all factor levels (seriously, just use this) |
| r | same standard deviation for factor levels (see comment above) |
| s | Tpha |

## Value

Power for Simple Effects in Two Factor Within Subjects LMM

## Examples

$$
\begin{aligned}
& \operatorname{lmm} 2 F s e(m 1.1=-.25, m 2.1=0, m 3.1=.10, m 4.1=.15, m 1.2=-.25, m 2.2=.10, m 3.2=.30, m 4.2=.35, \\
& s 1.1=.4, s 2.1=.5, s 3.1=2.5, s 4.1=2.0, s 1.2=.4, s 2.2=.5, s 3.2=2.5, s 4.2=2.0, r=.5, n=220)
\end{aligned}
$$

| LRcatCompute Power for Logistic Regression with a Single Categorical Pre- <br> dictor |
| :--- | :--- |

## Description

Compute Power for Logistic Regression with a Single Categorical Predictor

## Usage

```
LRcat \((\mathrm{p} 0=\) NULL, \(\mathrm{p} 1=\) NULL, prop \(=0.5\), alpha \(=0.05\), power,
    R2 = 0)
```

## Arguments

p0 Probability of a Desirable Outcome in the Control Condition
p1 Probability of a Desirable Outcome in the Treatment Condition
prop Proportion in the Treatment Condition
alpha Type I error (default is .05)
power Desired Power
R2 How Well Predictor of Interest is Explained by Other Predictors (default is 0)

## Value

Power for Logistic Regression with a Single Categorical Predictor

## Examples

$\operatorname{LRcat}(\mathrm{p} 0=.137, \mathrm{p} 1=.611, \mathrm{prop}=.689$, power=$=.95)$

LRcont Compute Power for Logistic Regression with Continuous Predictors

## Description

Compute Power for Logistic Regression with Continuous Predictors

## Usage

LRcont (OR = NA, $r=N A, E R=N U L L$, alpha $=0.05$, power $=$ NULL, R2 = 0)

## Arguments

| OR | Odds Ratio for Predictor of Interest |
| :--- | :--- |
| $r$ | Correlation for Predictor of Interest |
| ER | Event Ratio Probability of a Desirable Outcome Overall |
| alpha | Type I error (default is .05) |
| power | Desired Power |
| R2 | How Well Predictor of Interest is Explained by Other Predictors (default is 0) |

## Value

Power for Logistic Regression with Continuous Predictors

## Examples

```
LRcont(OR = 4.05, ER = .463, power=.95)
```

MANOVA1f Compute power for a One Factor MANOVA with up to two levels and up to four measures. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a One Factor MANOVA with up to two levels and up to four measures. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

MANOVA1f(m1.1, m2.1, m3.1 = NA, m4.1 = NA, m1.2, m2.2, m3.2 = NA, $m 4.2=N A, s 1.1=N A, s 2.1=N A, s 3.1=N A, s 4.1=N A$, s1.2 = NA, s2.2 = NA, s3.2 = NA, s4.2 = NA, r1.2_1 = NULL, r1.3_1 = NULL, r1.4_1 = NULL, r2.3_1 = NULL, r2.4_1 = NULL, r3.4_1 = NULL, r1.2_2 = NULL, r1.3_2 = NULL, r1.4_2 = NULL, r2.3_2 = NULL, r2.4_2 = NULL, r3.4_2 = NULL, $r=$ NULL, $s=$ NULL, $n$, alpha $=0.05$ )

## Arguments

m1. 1
Mean of first DV, 1st level Between Factor
m2.1 Mean of second DV, 1st level Between Factor
m3.1 Mean of third DV, 1st level Between Factor
m4.1 Mean of fourth DV, 1st level Between Factor

| m1. 2 | Mean of first DV, 2nd level Between Factor |
| :---: | :---: |
| m2.2 | Mean of second DV, 2nd level Between Factor |
| m3.2 | Mean of third DV, 2nd level Between Factor |
| m4.2 | Mean of fourth DV, 2nd level Between Factor |
| s1.1 | Standard deviation of first DV, 1st level Between Factor |
| s2.1 | Standard deviation of second DV, 1st level Between Factor |
| s3.1 | Standard deviation of third DV, 1st level Between Factor |
| s4.1 | Standard deviation of forth DV, 1st level Between Factor |
| s1.2 | Standard deviation of first DV, 2nd level Between Factor |
| s2.2 | Standard deviation of second DV, 2nd level Between Factor |
| s3.2 | Standard deviation of third DV, 2nd level Between Factor |
| s4.2 | Standard deviation of forth DV, 2nd level Between Factor |
| r1.2_1 | correlation DV 1 and DV 2, 1st level Between |
| r1.3_1 | correlation DV 1 and DV 3, 1st level Between |
| r1.4_1 | correlation DV 1 and DV 4, 1st level Between |
| r2.3_1 | correlation DV 1 and DV 3, 1st level Between |
| r2.4_1 | correlation DV 1 and DV 4, 1st level Between |
| r3.4_1 | correlation DV 1 and DV 4, 1st level Between |
| r1.2_2 | correlation DV 1 and DV 2, 2nd level Between |
| r1.3_2 | correlation DV 1 and DV 3, 2nd level Between |
| r1.4_2 | correlation DV 1 and DV 4, 2nd level Between |
| r2.3_2 | correlation DV 1 and DV 3, 2nd level Between |
| r2.4_2 | correlation DV 1 and DV 4, 2nd level Between |
| r3.4_2 | correlation DV 1 and DV 4, 2nd level Between |
| $r$ | sets same correlations between DVs on all factor levels (seriously, just use this) |
| s | sets same standard deviation for factor levels (see comment above) |
| n | Sample size for first group |
| alpha | Type I error (default is .05) |

## Value

Power for the One Factor Within Subjects and One Factor Between ANOVA

## Examples

```
MANOVA1f(n=40,m1.1=0,m2.1=1,m3.1=2.4,m4.1=-0.7,
m1.2=-0.25,m2.2=-2,m3.2=2,m4.2=-1,
s1.1=.4, s2.1=5, s3.1=1.6, s4.1=1.2,
s1.2=.4, s2.2=5, s3.2=1.6,s4.2=1.2,
r1.2_1=.1,r1.3_1=.1,r1.4_1=.1,
r2.3_1=.35,r2.4_1=.45,r3.4_1=.40,
```

```
r1.2_2=.1,r1.3_2=.1,r1.4_2=.1,
r2.3_2=.35,r2.4_2=.45,r3.4_2=.40,alpha=.05)
MANOVA1f(n=40,m1.1=0,m2.1=1,m3.1=2.4,m4.1=-0.7,
m1.2=-0.25,m2.2=-2,m3.2=2,m4.2=-1,
s=.4,r=.5,alpha=.05)
```

md_prec Compute Precision Analyses for Mean Differences

## Description

Compute Precision Analyses for Mean Differences

## Usage

md_prec(m1, m2, s1, s2, nlow, nhigh, propn1 $=0.5$, ci $=0.95$, by $=1$ )

## Arguments

| m 1 | Mean of first group |
| :--- | :--- |
| m 2 | Mean of second group |
| s 1 | Standard deviation of first group |
| s 2 | Standard deviation of second group |
| nlow | starting sample size |
| nhigh | ending sample size |
| propn1 | Proportion in First Group |
| ci | Type of Confidence Interval (e.g., .95) <br> Incremental increase in sample (e.g. nlow $=10$, nhigh $=24$, by $=2$, produces <br> by |

## Value

Precision Analyses for Mean Differences

## Examples

```
md_prec(m1=2,m2 =0, s1=5, s2=5,nlow=100, nhigh =1600, propn1=.5, ci=.95, by=100)
md_prec(m1=0,m2 =0, s1=5, s2=5,nlow=100, nhigh =40000, propn1=.5, ci=.95, by=1000)
```

Compute Power for Mediated (Indirect) Effects Requires correlations between all variables as sample size.

## Description

Compute Power for Mediated (Indirect) Effects Requires correlations between all variables as sample size.

## Usage

> med $(r \times m 1, r x m 2=0, r x m 3=0, r x m 4=0, r x y, r y m 1, r y m 2=0$, $r y m 3=0, r y m 4=0, r m 1 \mathrm{~m} 2=0, r m 1 \mathrm{~m} 3=0, r m 1 \mathrm{~m} 4=0$, $r m 2 \mathrm{~m} 3=0, r m 2 m 4=0, r m 3 \mathrm{~m} 4=0$, alpha $=0.05$, mvars, $n)$

## Arguments

| rxm1 | Correlation between predictor (x) and first mediator (m1) |
| :---: | :---: |
| rxm2 | Correlation between predictor (x) and second mediator (m2) |
| rxm3 | Correlation between predictor (x) and third mediator (m3) |
| rxm4 | Correlation between predictor (x) and fourth mediator (m4) |
| rxy | Correlation between DV (y) and predictor (x) |
| rym1 | Correlation between DV (y) and first mediator (m1) |
| rym2 | Correlation between DV (y) and second mediator (m2) |
| rym3 | Correlation DV (y) and third mediator (m3) |
| rym4 | Correlation DV (y) and fourth mediator (m4) |
| rm1m2 | Correlation first mediator (m1) and second mediator (m2) |
| rm1m3 | Correlation first mediator (m1) and third mediator (m3) |
| rm1m4 | Correlation first mediator (m1) and fourth mediator (m4) |
| rm2m3 | Correlation second mediator (m2) and third mediator (m3) |
| rm2m4 | Correlation second mediator (m2) and fourth mediator (m4) |
| rm3m4 | Correlation third mediator (m3) and fourth mediator (m4) |
| alpha | Type I error (default is .05) |
| mvars | Number of Mediators |
| n | Sample size |

## Value

Power for Mediated (Indirect) Effects

## Examples

```
med(rxm1=.25, rxy=-.35, rym1=-.5,mvars=1, n=150)
med(rxm1=.3, rxm2=.3, rxm3=.25, rxy=-. 35, rym1=-.5,rym2=-.5, rym3 = -. 5,
rm1m2=.7, rm1m3=.4,rm2m3=.4, mvars=3, n=150)
```

## MRC

Compute power for Multiple Regression with up to Five Predictors Example code below for three predictors. Expand as needed for four or five

## Description

Compute power for Multiple Regression with up to Five Predictors Example code below for three predictors. Expand as needed for four or five

## Usage

MRC(ry1 = NULL, ry2 = NULL, ry3 = NULL, ry4 = NULL, ry5 = NULL, r12 = NULL, r13 = NULL, r14 = NULL, r15 = NULL, r23 = NULL, r24 $=$ NULL, r25 $=$ NULL, r34 $=$ NULL, r35 $=$ NULL, r45 $=$ NULL, $\mathrm{n}=$ NULL, alpha $=0.05$ )

## Arguments

| ry1 | Correlation between DV $(\mathrm{y})$ and first predictor (1) |
| :--- | :--- |
| ry2 | Correlation between DV $(\mathrm{y})$ and second predictor (2) |
| ry3 | Correlation between DV $(\mathrm{y})$ and third predictor (3) |
| ry4 | Correlation between DV (y) and fourth predictor (4) |
| ry5 | Correlation between DV (y) and fifth predictor (5) |
| r12 | Correlation between first (1) and second predictor (2) |
| r13 | Correlation between first (1) and third predictor (3) |
| r14 | Correlation between first (1) and fourth predictor (4) |
| r15 | Correlation between first (1) and fifth predictor (5) |
| r23 | Correlation between second (2) and third predictor (3) |
| r24 | Correlation between second (2) and fourth predictor (4) |
| r25 | Correlation between second (2) and fifth predictor (5) |
| r34 | Correlation between third (3) and fourth predictor (4) |
| r35 | Correlation between third (3) and fifth predictor (5) |
| r45 | Correlation between fourth (4) and fifth predictor (5) |
| n | Sample size |
| alpha | Type I error (default is .05) |

## Value

Power for Multiple Regression with Two to Five Predictors

## Examples

```
MRC(ry1=.40,ry2=.40, r12=-.15,n=30)
MRC(ry1=.40,ry2=.40,ry3=-.40, r12=-.15, r13=-.60,r23=.25,n=24)
```

MRC_all Compute power for Multiple Regression with Up to Five Predictors Requires correlations between all variables as sample size. Means, sds, and alpha are option. Also computes Power(All)

## Description

Compute power for Multiple Regression with Up to Five Predictors Requires correlations between all variables as sample size. Means, sds, and alpha are option. Also computes Power(All)

## Usage

MRC_all(ry1 = NULL, ry2 = NULL, ry3 = NULL, ry4 = NULL, ry5 $=$ NULL, r12 $=$ NULL, r13 $=$ NULL, r14 $=$ NULL, r15 $=$ NULL, r23 $=$ NULL, r24 $=$ NULL, r25 $=$ NULL, r34 $=$ NULL, r35 $=$ NULL, r45 $=$ NULL, $\mathrm{n}=$ NULL, alpha $=0.05$, rep $=10000$ )

## Arguments

| ry1 | Correlation between DV (y) and first predictor (1) |
| :--- | :--- |
| ry2 | Correlation between DV (y) and second predictor (2) |
| ry3 | Correlation between DV (y) and third predictor (3) |
| ry4 | Correlation between DV (y) and fourth predictor (4) |
| ry5 | Correlation between DV (y) and fifth predictor (5) |
| r12 | Correlation between first (1) and second predictor (2) |
| r13 | Correlation between first (1) and third predictor (3) |
| r14 | Correlation between first (1) and fourth predictor (4) |
| r15 | Correlation between first (1) and fifth predictor (5) |
| r23 | Correlation between second (2) and third predictor (3) |
| r24 | Correlation between second (2) and fourth predictor (4) |
| r25 | Correlation between second (2) and fifth predictor (5) |
| r34 | Correlation between third (3) and fourth predictor (4) |
| r35 | Correlation between third (3) and fifth predictor (5) |
| r45 | Correlation between fourth (4) and fifth predictor (5) |
| n | Sample size |
| alpha | Type I error (default is .05) |
| rep | number of replications (default is 10000) |

Value
Power for Multiple Regression (ALL)

## Examples

```
MRC_all(ry1=. 50, ry2=.50,ry3=.50, r12=.2, r13=.3,r23=.4,n=82, rep=10000)
```

MRC_short2 | Compute Multiple Regression shortcuts with three predictors for Ind |
| :--- |
| Coefficients Requires correlations between all variables as sample |
| size. Means and sds are option. Also computes Power(All) |

## Description

Compute Multiple Regression shortcuts with three predictors for Ind Coefficients Requires correlations between all variables as sample size. Means and sds are option. Also computes Power(All)

## Usage

MRC_short2(ry1_1, ry2_1, ry3_1 = NULL, r12_1, r13_1 = NULL, r23_1 = NULL, n1, ry1_2, ry2_2, ry3_2 = NULL, r12_2, r13_2 = NULL, r23_2 = NULL, n2, alpha = 0.05, my_1 = 0, m1_1 = 0, m2_1 = 0, m3_1 = 0, s1_1 = 1, s2_1 = 1, s3_1 = 1, sy_1 = 1, my_2 = 0, $\mathrm{m} 1 \_2=0, \mathrm{~m} 2 \_2=0, \mathrm{~m} 3 \_2=0, \mathrm{~s} 1 \_2=1, \mathrm{~s} 2 \_2=1, \mathrm{~s} 3 \_2=1$, sy_2 = 1)

## Arguments

ry1_1
ry2_1 Correlation between DV (y) and second predictor (2), first group
ry3_1 Correlation between DV (y) and third predictor (3), first group
r12_1 Correlation between first (1) and second predictor (2), first group
r13_1 Correlation between first (1) and third predictor (3), first group
r23_1 Correlation between second (2) and third predictor (3), first group
n1 Sample size, first group
ry1_2 Correlation between DV (y) and first predictor (1), second group
ry2_2 Correlation between DV (y) and second predictor (2), second group
ry3_2 Correlation between DV (y) and third predictor (3), second group
r12_2 Correlation between first (1) and second predictor (2), second group
$r 13 \_2 \quad$ Correlation between first (1) and third predictor (3), second group
r23_2 Correlation between second (2) and third predictor (3), second group
n2 Sample size, second group
alpha Type I error (default is .05)

| my_1 | Mean of DV (default is 0), first group |
| :---: | :---: |
| m1_1 | Mean of first predictor (default is 0), first group |
| m2_1 | Mean of second predictor (default is 0 ), first group |
| m3_1 | Mean of third predictor (default is 0 ), first group |
| s1_1 | Standard deviation of first predictor (default is 1), first group |
| s2_1 | Standard deviation of second predictor (default is 1), first group |
| s3_1 | Standard deviation of third predictor (default is 1), first group |
| sy_1 | Standard deviation of DV (default is 1), first group |
| my_2 | Mean of DV (default is 0 ), second group |
| m1_2 | Mean of first predictor (default is 0 ), second group |
| m2_2 | Mean of second predictor (default is 0 ), second group |
| m3_2 | Mean of third predictor (default is 0 ), second group |
| s1_2 | Standard deviation of first predictor (default is 1), second group |
| s2_2 | Standard deviation of second predictor (default is 1), second group |
| s3_2 | Standard deviation of third predictor (default is 1), second group |
| sy_2 | Standard deviation of DV (default is 1), second group |

## Value

Multiple Regression shortcuts with three predictors for Ind Coefficients

## Examples

```
MRC_short2(ry1_1=.40, ry2_1=.40, ry3_1 =-.40, r12_1=-.15,r13_1=-.60, r23_1=.25,
ry1_2=.40, ry2_2=.10, ry3_2 =-.40, r12_2=-.15,r13_2=-.60, r23_2=.25,
n1=50, n2=50, alpha=.05,my_1=1,m1_1=1,m2_1=1,m3_1=1,
sy_1=7, s1_1=1, s2_1=1, s3_1=2,
my_2=1,m1_2=1,m2_2=1,m3_2=1,sy_2=7, s1_2=1,s2_2=1,s3_2=2)
```

MRC_shortcuts Compute Multiple Regression shortcuts with three predictors (will expand to handle two to five) Requires correlations between all variables as sample size. Means and sds are option. Also computes Power(All)

## Description

Compute Multiple Regression shortcuts with three predictors (will expand to handle two to five) Requires correlations between all variables as sample size. Means and sds are option. Also computes Power(All)

## Usage

MRC_shortcuts(ry1 = NULL, ry2 = NULL, ry3 = NULL, r12 = NULL, $r 13=$ NULL, $r 23=$ NULL, $n=100$, alpha $=0.05, \mathrm{my}=0$, $\mathrm{m} 1=0, \mathrm{~m} 2=0, \mathrm{~m} 3=0, \mathrm{~s} 1=1, \mathrm{~s} 2=1, \mathrm{~s} 3=1$, $\mathrm{sy}=1$ )

## Arguments

| ry1 | Correlation between DV (y) and first predictor (1) |
| :--- | :--- |
| ry2 | Correlation between DV (y) and second predictor (2) |
| ry3 | Correlation between DV (y) and third predictor (3) |
| r12 | Correlation between first (1) and second predictor (2) |
| r13 | Correlation between first (1) and third predictor (3) |
| r23 | Correlation between second (2) and third predictor (3) |
| n | Sample size |
| alpha | Type I error (default is .05) |
| my | Mean of DV (default is 0) |
| m1 | Mean of first predictor (default is 0) |
| m2 | Mean of second predictor (default is 0) |
| m3 | Mean of third predictor (default is 0) |
| s1 | Standard deviation of first predictor (default is 1) |
| s2 | Standard deviation of second predictor (default is 1) |
| s3 | Standard deviation of third predictor (default is 1) |
| sy | Standard deviation of DV (default is 1) |

## Value

Multiple Regression shortcuts with three predictors

## Examples

MRC_shortcuts $(r y 1=.40, r y 2=.40, r y 3=-.40, r 12=-.15, r 13=-.60, r 23=.25$,
$n=110, m y=1, m 1=1, m 2=1, m 3=1, s y=7, s 1=1, s 2=1, s 3=2)$
pairt Compute power for a Paired t-test Takes means, sd, and sample sizes. Alpha is .05 by default, alternative values may be entered by user. correlation ( $r$ ) defaults to . 50 .

## Description

Compute power for a Paired t-test Takes means, sd, and sample sizes. Alpha is .05 by default, alternative values may be entered by user. correlation (r) defaults to . 50 .

## Usage

pairt(m1 $=$ NULL, $m 2=$ NULL, $s=$ NULL, $n=$ NULL, $r=$ NULL, alpha $=0.05$ )

## Arguments

| m 1 | Mean for Pre Test |
| :--- | :--- |
| m 2 | Mean for Post Test |
| s | Standard deviation |
| n | Sample size |
| r | Correlation pre-post measures (default is .50) |
| alpha | Type I error (default is .05) |

## Value

Power for the Paired t -test

## Examples

```
    pairt(m1 = 25,m2=20, s = 5, n = 25, r = .5)
```

prop1 Compute power for a single sample proportion test Takes phi, degrees of freedom, and a range of sample sizes. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a single sample proportion test Takes phi, degrees of freedom, and a range of sample sizes. Alpha is .05 by default, alternative values may be entered by user

## Usage

prop1 (p1, p0, nlow, nhigh, alpha $=0.05$, tails $=2$, by $=1$ )

## Arguments

p1
expected proportion (a.k.a. alternative proportion)
p0 null proportion
nlow starting sample size
nhigh ending sample size
alpha Type I error (default is .05)
tails number of tails for test (default is 2)
by Incremental increase in sample (e.g. nlow $=10$, nhigh $=24$, by $=2$, produces estimates of 10,12 , and 14)

## Value

Power for Tests of Single Proportion

## Examples

$\operatorname{prop} 1(\mathrm{p} 1=.60, \mathrm{p} 0=.42, \mathrm{nlow}=20$, nhigh=100, tails=1, by=10)

Compute power for Tests of Two Independent Proportions Takes phi, degrees of freedom, and a range of sample sizes. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for Tests of Two Independent Proportions Takes phi, degrees of freedom, and a range of sample sizes. Alpha is .05 by default, alternative values may be entered by user

## Usage

propind(p1, p2, nlow, nhigh, nratio $=0.5$, alpha $=0.05$, tails $=2$, by = 1)

## Arguments

| p1 | expected proportion Group 1 |
| :--- | :--- |
| p2 | expected proportion Group 2 |
| nlow | starting sample size |
| nhigh | ending sample size |
| nratio | ratio of sample size of first group to second (default is .5 for equally sized <br> groups) |
| alpha | Type I error (default is .05 ) <br> tails |
| number of tails for test (default is 2$)$ |  |

## Value

Power for Tests of Two Independent Proportions

## Examples

```
propind(p1=.62, p2=.55,nlow=200,nhigh=2500, by=100,nratio=.2)
```

Compute power for $R 2$ change in Multiple Regression (up to three predictors) Requires correlations between all variables as sample size. Means, sds, and alpha are option. Also computes Power(All) Example code below for three predictors. Expand as needed for four or five

## Description

Compute power for R2 change in Multiple Regression (up to three predictors) Requires correlations between all variables as sample size. Means, sds, and alpha are option. Also computes Power(All) Example code below for three predictors. Expand as needed for four or five

## Usage

R2ch(ry1 = NULL, ry2 = NULL, ry3 = NULL, r12 = NULL, r13 = NULL, r23 = NULL, $\mathrm{n}=$ NULL, alpha $=0.05$, my $=0, \mathrm{~m} 1=0, \mathrm{~m} 2=0$, $\mathrm{m} 3=0, \mathrm{~s} 1=1$, $\mathrm{s} 2=1, \mathrm{~s} 3=1$, sy = 1)

## Arguments

| ry1 | Correlation between DV (y) and first predictor (1) |
| :--- | :--- |
| ry2 | Correlation between DV (y) and second predictor (2) |
| ry3 | Correlation between DV (y) and third predictor (3) |
| r12 | Correlation between first (1) and second predictor (2) |
| r13 | Correlation between first (1) and third predictor (3) |
| r23 | Correlation between second (2) and third predictor (3) |
| n | Sample size |
| alpha | Type I error (default is .05) |
| my | Mean of DV (default is 0) |
| m1 | Mean of first predictor (default is 0) |
| m2 | Mean of second predictor (default is 0) |
| m3 | Mean of third predictor (default is 0) |
| s1 | Standard deviation of first predictor (default is 1) |
| s2 | Standard deviation of second predictor (default is 1) |
| s3 | Standard deviation of third predictor (default is 1) |
| sy | Standard deviation of DV (default is 1) |

## Value

Power for R2 change in Multiple Regression (up to three predictors)

## Examples

$$
\operatorname{R2ch}(r y 1=.40, r y 2=.40, r y 3=-.40, r 12=-.15, r 13=-.60, r 23=.25, n=24)
$$

R2_prec | Compute Precision Analyses for $R$-Squared This approach simply |
| :--- |
| loops a function from MBESS |

## Description

Compute Precision Analyses for R-Squared This approach simply loops a function from MBESS

## Usage

R2_prec(R2, nlow, nhigh, pred, ci = 0.95, by = 1)

## Arguments

| R2 | R-squared |
| :--- | :--- |
| nlow | starting sample size |
| nhigh | ending sample size |
| pred | Number of Predictors |
| ci | Type of Confidence Interval (e.g., .95) |
| by | Incremental increase in sample (e.g. nlow $=10$, nhigh $=24$, by $=2$, produces <br> estimates of 10,12, and 14$)$ |

## Value

Precision Analyses for R-Squared

## Examples

```
R2_prec(R2=.467, nlow=24, nhigh=100, pred=3, by=4)
```

regint | Compute Power for Regression Interaction (Correlation/Coefficient |
| :--- |
| Approach) |

## Description

Compute Power for Regression Interaction (Correlation/Coefficient Approach)

## Usage

regint(Group1, Group2, $s x 1=1, s x 2=1, s y 1=1$, sy2 = 1, nlow, nhigh, alpha $=0.05$, Prop_n1 $=0.5$, by $=2$, Estimates $=1$ )

## Arguments

| Group1 | Estimates (r or b) for Group 1 |
| :--- | :--- |
| Group2 | Estimates (r or b) for Group 2 |
| $\mathrm{sx1}$ | Standard deviation of predictor, group 1 (defaults to 1) |
| $\mathrm{sx2}$ | Standard deviation of predictor, group 2 (defaults to 1) |
| sy1 | Standard deviation of outcome, group 1 (defaults to 1) |
| sy2 | Standard deviation of outcome, group 2 (defaults to 1) |
| nlow | starting sample size |
| nhigh | ending sample size |
| alpha | Type I error (default is .05) <br> Prop_n1 |
| Proportion of Sample in First Group (defaults to equal sample sizes) |  |
| by | incremental increase in sample (e.g. nlow $=10$, nhigh $=24$, by $=2$, produces <br> estimates of 10, 12, and 14) |
| Estimates | 1 for Correlations (default), 2 for coefficients |

## Value

Power for Regression Interaction (Correlation/Coefficient Approach)

## Examples

```
regint(Group1=-. 26,Group2=.25, alpha=.05,Prop_n1=0.5,nlow=110, nhigh=140,by=2,Estimates=1)
```

## Description

Compute Power for Regression Interaction (R2 Change Approach)

## Usage

regintR2(R2Mod, R2Ch, mod_pred, ch_pred, nlow, nhigh, by = 1, alpha = 0.05)

## Arguments

| R2Mod | Full Model R2 |
| :--- | :--- |
| R2Ch | Change in R2 Added by Interaction |
| mod_pred | Full Model Number of Predictors |
| ch_pred | Change Model Number of Predictors |
| nlow | starting sample size |

```
nhigh ending sample size
by incremental increase in sample (e.g. nlow = 10, nhigh =24, by =2, produces
                                estimates of 10, 12, and 14)
alpha Type I error (default is .05)
```

Value
Power for Regression Interaction (R2 Change Approach)

## Examples

regintR2(R2Mod=.092,R2Ch=.032,mod_pred=3, ch_pred=1,nlow=100,nhigh=400,by=20)

$$
\begin{array}{ll}
\text { r_prec } & \begin{array}{l}
\text { Compute Precision Analyses for Correlations This approach simply } \\
\text { loops a function from MBESS }
\end{array}
\end{array}
$$

## Description

Compute Precision Analyses for Correlations This approach simply loops a function from MBESS

## Usage

r_prec(r, nlow, nhigh, ci = 0.95, by = 1)

## Arguments

## $r$

nlow starting sample size
nhigh ending sample size
ci Type of Confidence Interval (e.g., .95)
by Incremental increase in sample (e.g. nlow $=10$, nhigh $=24$, by $=2$, produces estimates of 10,12 , and 14)

## Value

Precision Analyses for Correlations

## Examples

r_prec(r=.3, nlow=80, nhigh=400, by=20, ci=.95)

Compute power for a t test using $d$ statistic Takes $d$, sample size range, type of test, and tails.

## Description

Compute power for a t test using d statistic Takes d, sample size range, type of test, and tails.

## Usage

tfromd(d, nlow, nhigh, alpha $=0.05$, test $=" I "$, tails $=2$, by $=1$ )

## Arguments

| d | standardize mean difference (Cohen's d) |
| :--- | :--- |
| nlow | Starting sample size |
| nhigh | Ending sample size |
| alpha | Type I error (default is .05) |
| test | "I" for independent, "P" for paired |
| tails | one or two-tailed tests (default is 2) |
| by | Incremental increase in sample size from low to high |

## Value

Power for the t -test from d statistic

## Examples

tfromd(d=.2, nlow=10, nhigh=200, by=10, test="P")
tfromd( $d=.2$, nlow=10, nhigh=200, by=10, test="I")

```
win1bg1
```

Compute power for a One Factor Within Subjects and One Factor Between ANOVA with up to two by four levels (within). Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a One Factor Within Subjects and One Factor Between ANOVA with up to two by four levels (within). Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

```
win1bg1(m1.1, m2.1, m3.1 = NA, m4.1 = NA, m1.2, m2.2, m3.2 = NA,
    m4.2 = NA, s1.1 = NA, s2.1 = NA, s3.1 = NA, s4.1 = NA,
    s1.2 = NA, s2.2 = NA, s3.2 = NA, s4.2 = NA, r1.2_1 = NULL,
    r1.3_1 = NULL, r1.4_1 = NULL, r2.3_1 = NULL, r2.4_1 = NULL,
    r3.4_1 = NULL, r1.2_2 = NULL, r1.3_2 = NULL, r1.4_2 = NULL,
    r2.3_2 = NULL, r2.4_2 = NULL, r3.4_2 = NULL, r = NULL,
    s = NULL, n, alpha = 0.05)
```

## Arguments

m1. 1
m2. 1
Mean of first level Within Factor, 1st level Between Factor Mean of second level Within Factor, 1st level Between Factor
m3. 1
m4. 1 Mean of third level Within Factor, 1st level Between Factor
m1.2 Mean of first level Within Factor, 2nd level Between Factor Mean of fourth level Within Factor, 1st level Between Factor
m2.2 Mean of second level Within Factor, 2nd level Between Factor
m3.2 Mean of third level Within Factor, 2nd level Between Factor
m4.2 Mean of fourth level Within Factor, 2nd level Between Factor
s1.1 Standard deviation of first level Within Factor, 1st level Between Factor
s2.1 Standard deviation of second level Within Factor, 1st level Between Factor
s3.1 Standard deviation of third level Within Factor, 1st level Between Factor
s4.1 Standard deviation of forth level Within Factor, 1st level Between Factor
s1.2 Standard deviation of first level Within Factor, 2nd level Between Factor
s2.2 Standard deviation of second level Within Factor, 2nd level Between Factor
s3.2 Standard deviation of third level Within Factor, 2nd level Between Factor
s4.2 Standard deviation of forth level Within Factor, 2nd level Between Factor
r1.2_1 correlation Within Factor Level 1 and Within Factor, Level 2, 1st level Between
r1.3_1 correlation Within Factor Level 1 and Within Factor, Level 3, 1st level Between
r1.4_1 correlation Within Factor Level 1 and Within Factor, Level 4, 1st level Between
r2.3_1 correlation Within Factor Level 1 and Within Factor, Level 3, 1st level Between
r2.4_1 correlation Within Factor Level 1 and Within Factor, Level 4, 1st level Between
r3.4_1 correlation Within Factor Level 1 and Within Factor, Level 4, 1st level Between
r1.2_2 correlation Within Factor Level 1 and Within Factor, Level 2, 2nd level Between
r1.3_2 correlation Within Factor Level 1 and Within Factor, Level 3, 2nd level Between
r1.4_2 correlation Within Factor Level 1 and Within Factor, Level 4, 2nd level Between
r2.3_2 correlation Within Factor Level 1 and Within Factor, Level 3, 2nd level Between
r2.4_2 correlation Within Factor Level 1 and Within Factor, Level 4, 2nd level Between
r3.4_2 correlation Within Factor Level 1 and Within Factor, Level 4, 2nd level Between
$r$
$s \quad$ sets same standard deviation for factor levels (see comment above)
n Sample size for first group
alpha Type I error (default is .05)
win1F

## Value

Power for the One Factor Within Subjects and One Factor Between ANOVA

## Examples

```
win1bg1(m1.1 = -. 25, m2.1=0, m3.1=0.10, m4.1=.15,

```

```
win1F
```

Compute power for a One Factor Within Subjects ANOVA with up to four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a One Factor Within Subjects ANOVA with up to four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

win1F(m1, m2, m3 = NA, m4 = NA, s1, s2, s3 = NULL, s4 = NULL, r12, r13 = NULL, r14 = NULL, r23 = NULL, r24 = NULL, r34 = NULL, n, alpha $=0.05$ )

## Arguments

m1
Mean of first time point
m2
m3
m4 Mean of fourth time point
s1
s2
s3
s4
r12
r13 correlation Time 1 and Time 3
r14 correlation Time 1 and Time 4
r23 correlation Time 2 and Time 3

| r24 | correlation Time 2 and Time 4 |
| :--- | :--- |
| r34 | correlation Time 3 and Time 4 |
| n | Sample size for first group |
| alpha | Type I error (default is .05) |

## Value

Power for the One Factor Within Subjects ANOVA

## Examples

```
win1F(m1=-. 25,m2=.00,m3=.10, m4=. 15, s1=.4, s2=.5, s3=.6, s4=.7,
r12=.50, r13=.30, r14=.15, r23=.5, r24=.30, r34=.50, n=25)
win1F(m1=-. 25,m2=.00,m3=.10,m4=.15,s1=.4, s2=.5, s3=2.5, s4=2.0,

```

```
win1Ftrends
```

Compute power for a One Factor Within Subjects Trends with up to four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a One Factor Within Subjects Trends with up to four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

win1Ftrends(m1, m2, m3 = NA, m4 = NA, s1, s2, s3 = NULL, s4 = NULL, r12, r13 = NULL, r14 = NULL, r23 = NULL, r24 = NULL, $r 34=$ NULL, $n$, alpha $=0.05$ )

## Arguments

m1
Mean of first time point
m2
m3
m4 Mean of fourth time point
s1
s2
s3
s4
r12 correlation Time 1 and Time 2
r13
Mean of second time point
Mean of third time point

Standard deviation of first time point
Standard deviation of second time point
Standard deviation of third time point
Standard deviation of forth time point
correlation Time 1 and Time 3

| r14 | correlation Time 1 and Time 4 |
| :--- | :--- |
| r23 | correlation Time 2 and Time 3 |
| r24 | correlation Time 2 and Time 4 |
| r34 | correlation Time 3 and Time 4 |
| n | Sample size for first group |
| alpha | Type I error (default is .05) |

## Value

Power for the One Factor Within Subjects Trends

## Examples

```
win1Ftrends(m1=-. 25,m2=-. 15,m3=-.05,m4=.05,s1=.4, s2=.5, s3=.6, s4=.7,
r12=.50, r13=.30, r14=.15, r23=.5, r24=.30, r34=.50, n=25)
```

win2F Compute power for a Two Factor Within Subjects ANOVA with up to two by four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Description

Compute power for a Two Factor Within Subjects ANOVA with up to two by four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

## Arguments

| m 1.1 | Mean of first level factor 1, 1st level factor two |
| :--- | :--- |
| m 2.1 | Mean of second level factor 1, 1st level factor two |
| m 3.1 | Mean of third level factor 1,1st level factor two |
| m 4.1 | Mean of fourth level factor 1, 1st level factor two |

| m1. 2 | Mean of first level factor 1, 2nd level factor two |
| :---: | :---: |
| m2. 2 | Mean of second level factor 1, 2nd level factor two |
| m3. 2 | Mean of third level factor 1, 2nd level factor two |
| m4.2 | Mean of fourth level factor 1, 2nd level factor two |
| s1.1 | Standard deviation of first level factor 1, 1st level factor two |
| s2. 1 | Standard deviation of second level factor 1, 1st level factor two |
| s3.1 | Standard deviation of third level factor 1, 1st level factor two |
| s4.1 | Standard deviation of forth level factor 1, 1st level factor two |
| s1.2 | Standard deviation of first level factor 1, 2nd level factor two |
| s2. 2 | Standard deviation of second level factor 1, 2nd level factor two |
| s3.2 | Standard deviation of third level factor 1, 2nd level factor two |
| s4.2 | Standard deviation of forth level factor 1, 2nd level factor two |
| r12 | correlation Factor 1, Level 1 and Factor 1, Level 2 |
| r13 | correlation Factor 1, Level 1 and Factor 1, Level 3 |
| r14 | correlation Factor 1, Level 1 and Factor 1, Level 4 |
| r15 | correlation Factor 1, Level 1 and Factor 2, Level 1 |
| r16 | correlation Factor 1, Level 1 and Factor 2, Level 2 |
| r17 | correlation Factor 1, Level 1 and Factor 2, Level 3 |
| r18 | correlation Factor 1, Level 1 and Factor 2, Level 4 |
| r23 | correlation Factor 1, Level 2 and Factor 1, Level 3 |
| r24 | correlation Factor 1, Level 2 and Factor 1, Level 4 |
| r25 | correlation Factor 1, Level 2 and Factor 2, Level 1 |
| r26 | correlation Factor 1, Level 2 and Factor 2, Level 2 |
| r27 | correlation Factor 1, Level 2 and Factor 2, Level 3 |
| r28 | correlation Factor 1, Level 2 and Factor 2, Level 4 |
| r34 | correlation Factor 1, Level 3 and Factor 1, Level 4 |
| r35 | correlation Factor 1, Level 3 and Factor 2, Level 1 |
| r36 | correlation Factor 1, Level 3 and Factor 2, Level 2 |
| r37 | correlation Factor 1, Level 3 and Factor 2, Level 3 |
| r38 | correlation Factor 1, Level 3 and Factor 2, Level 4 |
| r45 | correlation Factor 1, Level 4 and Factor 2, Level 1 |
| r46 | correlation Factor 1, Level 4 and Factor 2, Level 2 |
| r47 | correlation Factor 1, Level 4 and Factor 2, Level 3 |
| r48 | correlation Factor 1, Level 4 and Factor 2, Level 4 |
| r56 | correlation Factor 2, Level 1 and Factor 2, Level 2 |
| r57 | correlation Factor 2, Level 1 and Factor 2, Level 3 |
| r58 | correlation Factor 2, Level 1 and Factor 2, Level 4 |

| r67 | correlation Factor 2, Level 2 and Factor 2, Level 3 |
| :--- | :--- |
| r68 | correlation Factor 2, Level 2 and Factor 2, Level 4 |
| r78 | correlation Factor 2, Level 3 and Factor 2, Level 4 |
| $r$ | sets same correlations between DVs on all factor levels (seriously, just use this) |
| $s$ | sets same standard deviation for factor levels (see comment above) |
| n | Sample size for first group |
| alpha | Type I error (default is .05) |

## Value

Power for the Two Factor Within Subjects ANOVA

## Examples

```
win2F(m1.1=-. 25,m2.1=0,m3.1=.10,m4.1=.15,m1.2=-. 25,m2.2=.10,m3.2=.30,m4.2=.35,
s1.1=.4,s2.1=.5,s3.1=2.5,s4.1=2.0, s1.2=.4,s2.2=.5,s3.2=2.5,s4.2=2.0,r=.5,n=80)
win2F(m1.1=-. 25,m2.1=0,m1.2=-. 25,m2.2=.10, s1.1=.4, s2.1=.5, , s1.2=.4, s2.2=.5,
r12=.5,r13=.4,r14=.55,r23=.4,r24=.5,r34=.45,n=200)
```

win2Fse Compute power for Simple Effects in Two Factor Within Subjects
ANOVA with up to two by four levels. Takes means, sds, and sam-
ple sizes for each group. Alpha is .05 by default, alternative values
may be entered by user

## Description

Compute power for Simple Effects in Two Factor Within Subjects ANOVA with up to two by four levels. Takes means, sds, and sample sizes for each group. Alpha is .05 by default, alternative values may be entered by user

## Usage

## Arguments

| m1. 1 | Mean of first level factor 1,1 st level factor two |
