Package ‘qpmadr’

August 6, 2020

Type Package

Title Interface to the 'qpmad' Quadratic Programming Solver

Version 0.1.0

Date 2020-07-16

Description Efficiently solve quadratic problems with linear inequality, equality and box constraints. The method used is outlined in D. Goldfarb, and A. Idnani (1983) <doi:10.1007/BF02591962>.

`qpmadParameters` *Set qpmad parameters*

Description

Set qpmad parameters

Usage

```
qpmadParameters(
  isFactorized = FALSE,
  maxIter = -1,
  tol = 1e-12,
  checkPD = TRUE
)
```

Arguments

`isFactorized`	If `TRUE` then `H` is a lower Cholesky factor.
`maxIter`	Maximum number of iterations, if not positive then no limit.
`tol`	Convergence tolerance.
`checkPD`	If `FALSE` then `H` is assumed to be positive definite and no checks are made.

Value

a list suitable to be used as the pars-argument to `solveqp`

See Also

`solveqp`

Examples

```
qpmadParameters(checkPD = TRUE)
```

solveqp *Quadratic Programming*

Description

Solves

$$argmin 0.5x'Hx + h'x$$

s.t.

$$lb_i \leq x_i \leq ub_i$$

$$Alb_i \leq (Ax)_i \leq Aub_i$$

Usage

```
solveqp(
  H,
  h = NULL,
  lb = NULL,
  ub = NULL,
  A = NULL,
  Alb = NULL,
  Aub = NULL,
  pars = list()
)
```

Arguments

`H`	Symmetric **positive definite** matrix, n*n. Only the lower triangular part is used.
`h`	*Optional*, vector of length n.
`lb, ub`	*Optional*, lower/upper bounds of `x`. Will be repeated n times if length is one.
`A`	*Optional*, constraints matrix of dimension p*n, where each row corresponds to a constraint. For equality constraints let corresponding elements in `Alb` equal those in `Aub`
`Alb, Aub`	*Optional*, lower/upper bounds for Ax.
`pars`	*Optional*, qpmad-solver parameters, conveniently set with `qpmadParameters`

Value

At least one of `lb`, `ub` or `A` must be specified. If `A` has been specified then also at least one of `Alb` or `Aub`. Returns a list with elements `solution` (the solution vector), `status` (a status code) and `message` (a human readable message). If `status` = `0` the algorithm has converged. Possible status codes:

- `0`: Ok
- `-1`: Numerical issue, matrix (probably) not positive definite

- 1: Inconsistent
- 2: Infeasible equality
- 3: Infeasible inequality
- 4: Maximal number of iterations

qpmadParameters

Examples

```
## Assume we want to minimize: -(0 5 0) %*% b + 1/2 b^T b
## under the constraints:      A^T b >= b0
## with b0 = (-8,2,0)^T
## and      (-4  2  0)
##      A = (-3  1 -2)
##          ( 0  0  1)
## we can use solveqp as follows:
##
Dmat       <- diag(3)
dvec       <- c(0,-5,0)
Amat       <- t(matrix(c(-4,-3,0,2,1,0,0,-2,1),3,3))
bvec       <- c(-8,2,0)
solveqp(Dmat,dvec,A=Amat,Alb=bvec)
```
