

Package ‘reticulate’

May 27, 2020

Type Package

Title Interface to 'Python'

Version 1.16

Description Interface to 'Python' modules, classes, and functions. When calling into 'Python', R data types are automatically converted to their equivalent 'Python' types. When values are returned from 'Python' to R they are converted back to R types. Compatible with all versions of 'Python' >= 2.7.

License Apache License 2.0

URL <https://github.com/rstudio/reticulate>

BugReports <https://github.com/rstudio/reticulate/issues>

SystemRequirements Python (>= 2.7.0)

Encoding UTF-8

LazyData true

Depends R (>= 3.0)

Imports graphics, jsonlite, Matrix, methods, rappidirs, Rcpp (>= 0.12.7), utils

Suggests callr, knitr, rmarkdown, testthat

LinkingTo Rcpp

RoxygenNote 7.1.0

VignetteBuilder knitr

NeedsCompilation yes

array_reshape *Reshape an Array*

Description

Reshape (reindex) a multi-dimensional array, using row-major (C-style) reshaping semantics by default.

Usage

```
array_reshape(x, dim, order = c("C", "F"))
```

Arguments

x	An array
dim	The new dimensions to be set on the array.
order	The order in which elements of x should be read during the rearrangement. "C" means elements should be read in row-major order, with the last index changing fastest; "F" means elements should be read in column-major order, with the first index changing fastest.

Details

This function differs from e.g. `dim(x) <- dim` in a very important way: by default, `array_reshape()` will fill the new dimensions in row-major (C-style) ordering, while `dim<-()` will fill new dimensions in column-major (Fortran-style) ordering. This is done to be consistent with libraries like NumPy, Keras, and TensorFlow, which default to this sort of ordering when reshaping arrays. See the examples for why this difference may be important.

Examples

```
## Not run:
# let's construct a 2x2 array from a vector of 4 elements
x <- 1:4

# rearrange will fill the array row-wise
```

```

array_reshape(x, c(2, 2))
#      [,1] [,2]
# [1,]    1    2
# [2,]    3    4
# setting the dimensions 'fills' the array col-wise
dim(x) <- c(2, 2)
x
#      [,1] [,2]
# [1,]    1    3
# [2,]    2    4

## End(Not run)

```

as.character.python.builtin.bytes*Convert Python bytes to an R character vector***Description**

Convert Python bytes to an R character vector

Usage

```

## S3 method for class 'python.builtin.bytes'
as.character(x, encoding = "utf-8", errors = "strict", ...)

```

Arguments

- `x` object to be coerced or tested.
- `encoding` Encoding to use for conversion (defaults to utf-8)
- `errors` Policy for handling conversion errors. Default is 'strict' which raises an error. Other possible values are 'ignore' and 'replace'
- `...` further arguments passed to or from other methods.

configure_environment *Configure a Python Environment***Description**

Configure a Python environment, satisfying the Python dependencies of any loaded R packages.

Usage

```
configure_environment(package = NULL, force = FALSE)
```

Arguments

package	The name of a package to configure. When NULL, <code>reticulate</code> will instead look at all loaded packages and discover their associated Python requirements.
force	Boolean; force configuration of the Python environment? Note that <code>configure_environment()</code> is a no-op within non-interactive R sessions. Use this if you require automatic environment configuration, e.g. when testing a package on a continuous integration service.

Details

Normally, this function should only be used by package authors, who want to ensure that their package dependencies are installed in the active Python environment. For example:

```
.onLoad <- function(libname, pkgname) {  
  reticulate::configure_environment(pkgname)  
}
```

If the Python session has not yet been initialized, or if the user is not using the default Miniconda Python installation, no action will be taken. Otherwise, `reticulate` will take this as a signal to install any required Python dependencies into the user's Python environment.

If you'd like to disable `reticulate`'s auto-configure behavior altogether, you can set the environment variable:

```
RETICULATE_AUTOCONFIGURE = FALSE
```

e.g. in your `~/.Renviron` or similar.

Note that, in the case where the Python session has not yet been initialized, `reticulate` will automatically ensure your required Python dependencies are installed after the Python session is initialized (when appropriate).

Description

Create a Python dictionary object, including a dictionary whose keys are other Python objects rather than character vectors.

Usage

```
dict(..., convert = FALSE)  
  
py_dict(keys, values, convert = FALSE)
```

Arguments

...	Name/value pairs for dictionary (or a single named list to be converted to a dictionary).
convert	TRUE to automatically convert Python objects to their R equivalent. If you pass FALSE you can do manual conversion using the <code>py_to_r()</code> function.
keys	Keys to dictionary (can be Python objects)
values	Values for dictionary

Value

A Python dictionary

Note

The returned dictionary will not automatically convert its elements from Python to R. You can do manual conversion with the `py_to_r()` function or pass `convert = TRUE` to request automatic conversion.

eng_python

A reticulate Engine for Knitr

Description

This provides a `reticulate` engine for `knitr`, suitable for usage when attempting to render Python chunks. Using this engine allows for shared state between Python chunks in a document – that is, variables defined by one Python chunk can be used by later Python chunks.

Usage

```
eng_python(options)
```

Arguments

options	Chunk options, as provided by <code>knitr</code> during chunk execution.
---------	--

Details

The engine can be activated by setting (for example)

```
knitr::knit_engines$set(python = reticulate::eng_python)
```

Typically, this will be set within a document's setup chunk, or by the environment requesting that Python chunks be processed by this engine. Note that `knitr` (since version 1.18) will use the `reticulate` engine by default when executing Python chunks within an R Markdown document.

import	<i>Import a Python module</i>
--------	-------------------------------

Description

Import the specified Python module for calling from R.

Usage

```
import(module, as = NULL, convert = TRUE, delay_load = FALSE)

import_main(convert = TRUE)

import_builtin(convert = TRUE)

import_from_path(module, path = ".", convert = TRUE)
```

Arguments

module	Module name
as	Alias for module name (affects names of R classes). Note that this is an advanced parameter that should generally only be used in package development (since it affects the S3 name of the imported class and can therefore interfere with S3 method dispatching).
convert	TRUE to automatically convert Python objects to their R equivalent. If you pass FALSE you can do manual conversion using the py_to_r() function.
delay_load	TRUE to delay loading the module until it is first used. FALSE to load the module immediately. If a function is provided then it will be called once the module is loaded. If a list containing on_load() and on_error(e) elements is provided then on_load() will be called on successful load and on_error(e) if an error occurs.
path	Path to import from

Details

The `import_from_path` function imports a Python module from an arbitrary filesystem path (the directory of the specified python script is automatically added to the `sys.path`).

Value

A Python module

Examples

```
## Not run:
main <- import_main()
sys <- import("sys")

## End(Not run)
```

`install_miniconda` *Install Miniconda*

Description

Download the [Miniconda](#) installer, and use it to install Miniconda.

Usage

```
install_miniconda(path = miniconda_path(), update = TRUE, force = FALSE)
```

Arguments

<code>path</code>	The path in which Miniconda will be installed. Note that the installer does not support paths containing spaces. See miniconda_path for more details on the default path used by <code>reticulate</code> .
<code>update</code>	Boolean; update to the latest version of Miniconda after install?
<code>force</code>	Boolean; force re-installation if Miniconda is already installed at the requested path?

See Also

Other miniconda: [miniconda_path\(\)](#), [miniconda_update\(\)](#)

`iterate` *Traverse a Python iterator or generator*

Description

Traverse a Python iterator or generator

Usage

```
iterate(it, f = base::identity, simplify = TRUE)

iter_next(it, completed = NULL)

as_iterator(x)
```

Arguments

it	Python iterator or generator
f	Function to apply to each item. By default applies the identity function which just reflects back the value of the item.
simplify	Should the result be simplified to a vector if possible?
completed	Sentinel value to return from <code>iter_next()</code> if the iteration completes (defaults to NULL but can be any R value you specify).
x	Python iterator or iterable

Details

Simplification is only attempted all elements are length 1 vectors of type "character", "complex", "double", "integer", or "logical".

Value

For `iterate()`, A list or vector containing the results of calling f on each item in x (invisibly); For `iter_next()`, the next value in the iteration (or the sentinel completed value if the iteration is complete).

miniconda_path	<i>Path to Miniconda</i>
----------------	--------------------------

Description

The path to the Miniconda installation to use. By default, an OS-specific path is used. If you'd like to instead set your own path, you can set the RETICULATE_MINICONDA_PATH environment variable.

Usage

```
miniconda_path()
```

See Also

Other miniconda: [install_miniconda\(\)](#), [miniconda_update\(\)](#)

`miniconda_update` *Update Miniconda*

Description

Update Miniconda to the latest version.

Usage

```
miniconda_update(path = miniconda_path())
```

Arguments

<code>path</code>	The path in which Miniconda will be installed. Note that the installer does not support paths containing spaces.
-------------------	--

See Also

Other miniconda: [install_miniconda\(\)](#), [miniconda_path\(\)](#)

`np_array` *NumPy array*

Description

Create NumPy arrays and convert the data type and in-memory ordering of existing NumPy arrays.

Usage

```
np_array(data, dtype = NULL, order = "C")
```

Arguments

<code>data</code>	Vector or existing NumPy array providing data for the array
<code>dtype</code>	Numpy data type (e.g. "float32", "float64", etc.)
<code>order</code>	Memory ordering for array. "C" means C order, "F" means Fortran order.

Value

A NumPy array object.

py

Interact with the Python Main Module

Description

The py object provides a means for interacting with the Python main session directly from R. Python objects accessed through py are automatically converted into R objects, and can be used with any other R functions as needed.

Usage

py

Format

An R object acting as an interface to the Python main module.

PyClass

Create a python class

Description

Create a python class

Usage

PyClass(classname, defs = list(), inherit = NULL)

Arguments

classname	Name of the class. The class name is useful for S3 method dispatch.
defs	A named list of class definitions - functions, attributes, etc.
inherit	A list of Python class objects. Usually these objects have the <code>python.builtin.type</code> S3 class.

Examples

```
## Not run:  
Hi <- PyClass("Hi", list(  
  name = NULL,  
  `__init__` = function(self, name) {  
    self$name <- name  
    NULL  
  },  
  say_hi = function(self) {  
    paste0("Hi ", self$name)
```

```

        }
))

a <- Hi("World")

## End(Not run)

```

py_available*Check if Python is available on this system***Description**

Check if Python is available on this system

Usage

```

py_available(initialize = FALSE)

py_numpy_available(initialize = FALSE)

```

Arguments

initialize	TRUE to attempt to initialize Python bindings if they aren't yet available (defaults to FALSE).
------------	---

Value

Logical indicating whether Python is initialized.

Note

The `py_numpy_available` function is a superset of the `py_available` function (it calls `py_available` first before checking for NumPy).

py_capture_output*Capture and return Python output***Description**

Capture and return Python output

Usage

```
py_capture_output(expr, type = c("stdout", "stderr"))
```

Arguments

expr	Expression to capture stdout for
type	Streams to capture (defaults to both stdout and stderr)

Value

Character vector with output

py_config	<i>Python configuration</i>
-----------	-----------------------------

Description

Information on Python and Numpy versions detected

Usage

```
py_config()
```

Value

Python configuration object; Logical indicating whether Python bindings are available

py_del_item	<i>Delete / remove an item from a Python object</i>
-------------	---

Description

Delete an item associated with a Python object, as through its `__delitem__` method.

Usage

```
py_del_item(x, name)
```

Arguments

x	A Python object.
name	The item name.

Value

The (mutated) object x, invisibly.

See Also

Other item-related APIs: [py_get_item\(\)](#), [py_set_item\(\)](#)

`py_discover_config` *Discover the version of Python to use with reticulate.*

Description

This function enables callers to check which versions of Python will be discovered on a system as well as which one will be chosen for use with reticulate.

Usage

```
py_discover_config(required_module = NULL, use_environment = NULL)
```

Arguments

<code>required_module</code>	A optional module name that must be available in order for a version of Python to be used.
<code>use_environment</code>	An optional virtual/conda environment name to prefer in the search

Value

Python configuration object.

`py_ellipsis` *The builtin constant Ellipsis*

Description

The builtin constant Ellipsis

Usage

```
py_ellipsis()
```

`py_func`

Wrap an R function in a Python function with the same signature.

Description

This function could wrap an R function in a Python function with the same signature. Note that the signature of the R function must not contain esoteric Python-incompatible constructs.

Usage

```
py_func(f)
```

Arguments

<code>f</code>	An R function
----------------	---------------

Value

A Python function that calls the R function `f` with the same signature.

`py_function_custom_scaffold`

Custom Scaffolding of R Wrappers for Python Functions

Description

This function can be used to generate R wrapper for a specified Python function while allowing to inject custom code for critical parts of the wrapper generation, such as process the any part of the docs obtained from `py_function_docs()` and append additional roxygen fields. The result from execution of `python_function` is assigned to a variable called `python_function_result` that can also be processed by `postprocess_fn` before writing the closing curly braces for the generated wrapper function.

Usage

```
py_function_custom_scaffold(  
  python_function,  
  r_function = NULL,  
  additional_roxygen_fields = NULL,  
  process_docs_fn = function(docs) docs,  
  process_param_fn = function(param, docs) param,  
  process_param_doc_fn = function(param_doc, docs) param_doc,  
  postprocess_fn = function() { },  
  file_name = NULL  
)
```

Arguments

<code>python_function</code>	Fully qualified name of Python function or class constructor (e.g. <code>tf\$layers\$average_pooling1d</code>)
<code>r_function</code>	Name of R function to generate (defaults to name of Python function if not specified)
<code>additional_roxygen_fields</code>	A list of additional roxygen fields to write to the roxygen docs, e.g. <code>list(export = "", rdname = "generated-wrappers")</code> .
<code>process_docs_fn</code>	A function to process docs obtained from <code>reticulate::py_function_docs(python_function)</code> .
<code>process_param_fn</code>	A function to process each parameter needed for <code>python_funcion</code> before executing <code>python_funcion</code> .
<code>process_param_doc_fn</code>	A function to process the roxygen docstring for each parameter.
<code>postprocess_fn</code>	A function to inject any custom code in the form of a string before writing the closing curly braces for the generated wrapper function.
<code>file_name</code>	The file name to write the generated wrapper function to. If <code>NULL</code> , the generated wrapper will only be printed out in the console.

Examples

```
## Not run:

library(tensorflow)
library(stringr)

# Example of a `process_param_fn` to cast parameters with default values
# that contains "L" to integers
process_int_param_fn <- function(param, docs) {
  # Extract the list of parameters that have integer values as default
  int_params <- gsub(
    " = [-]?[0-9]+L",
    "",
    str_extract_all(docs$signature, "[A-z]+ = [-]?[0-9]+L")[[1]])
  # Explicitly cast parameter in the list obtained above to integer
  if (param %in% int_params) {
    param <- paste0("as.integer(", param, ")")
  }
  param
}

# Note that since the default value of parameter `k` is `1L`. It is wrapped
# by `as.integer()` to ensure it's casted to integer before sending it to `tf$nn$top_k`
# for execution. We then print out the python function result.
py_function_custom_scaffold(
  "tf$nn$top_k",
  r_function = "top_k",
  process_param_fn = process_int_param_fn,
```

```
postprocess_fn = function() { "print(python_function_result)" })  
  
## End(Not run)
```

py_get_attr

Get an attribute of a Python object

Description

Get an attribute of a Python object

Usage

```
py_get_attr(x, name, silent = FALSE)
```

Arguments

x	Python object
name	Attribute name
silent	TRUE to return NULL if the attribute doesn't exist (default is FALSE which will raise an error)

Value

Attribute of Python object

py_get_item

Get an item from a Python object

Description

Retrieve an item from a Python object, similar to how `x[name]` might be used in Python code to access an item indexed by key on an object `x`. The object's `__getitem__` method will be called.

Usage

```
py_get_item(x, key, silent = FALSE)
```

Arguments

x	A Python object.
key	The key used for item lookup.
silent	Boolean; when TRUE, attempts to access missing items will return NULL rather than throw an error.

See Also

Other item-related APIs: [py_del_item\(\)](#), [py_set_item\(\)](#)

`py_has_attr`

Check if a Python object has an attribute

Description

Check whether a Python object `x` has an attribute `name`.

Usage

`py_has_attr(x, name)`

Arguments

<code>x</code>	A python object.
<code>name</code>	The attribute to be accessed.

Value

TRUE if the object has the attribute `name`, and FALSE otherwise.

`py_help`

Documentation for Python Objects

Description

Documentation for Python Objects

Usage

`py_help(object)`

Arguments

<code>object</code>	Object to print documentation for
---------------------	-----------------------------------

py_id	<i>Unique identifier for Python object</i>
-------	--

Description

Get a globally unique identifier for a Python object.

Usage

```
py_id(object)
```

Arguments

object	Python object
--------	---------------

Value

Unique identifier (as integer) or NULL

Note

In the current implementation of CPython this is the memory address of the object.

py_install	<i>Install Python packages</i>
------------	--------------------------------

Description

Install Python packages into a virtual environment or Conda environment.

Usage

```
py_install(  
  packages,  
  envname = NULL,  
  method = c("auto", "virtualenv", "conda"),  
  conda = "auto",  
  python_version = NULL,  
  pip = FALSE,  
  ...  
)
```

Arguments

<code>packages</code>	A vector of Python packages to install.
<code>envname</code>	The name, or full path, of the environment in which Python packages are to be installed. When NULL (the default), the active environment as set by the RETICULATE_PYTHON_ENV variable will be used; if that is unset, then the <code>r-reticulate</code> environment will be used.
<code>method</code>	Installation method. By default, "auto" automatically finds a method that will work in the local environment. Change the default to force a specific installation method. Note that the "virtualenv" method is not available on Windows.
<code>conda</code>	The path to a conda executable. Use "auto" to allow <code>reticulate</code> to automatically find an appropriate conda binary. See Finding Conda for more details.
<code>python_version</code>	The requested Python version. Ignored when attempting to install with a Python virtual environment.
<code>pip</code>	Boolean; use pip for package installation? This is only relevant when Conda environments are used, as otherwise packages will be installed from the Conda repositories.
<code>...</code>	Additional arguments passed to <code>conda_install()</code> or <code>virtualenv_install()</code> .

Details

On Linux and OS X the "virtualenv" method will be used by default ("conda" will be used if virtualenv isn't available). On Windows, the "conda" method is always used.

See Also

[conda-tools](#), [virtualenv-tools](#)

`py_is_null_xptr` *Check if a Python object is a null externalptr*

Description

Check if a Python object is a null externalptr

Usage

```
py_is_null_xptr(x)
py_validate_xptr(x)
```

Arguments

<code>x</code>	Python object
----------------	---------------

Details

When Python objects are serialized within a persisted R environment (e.g. .RData file) they are deserialized into null externalptr objects (since the Python session they were originally connected to no longer exists). This function allows you to safely check whether a Python object is a null externalptr.

The `py_validate` function is a convenience function which calls `py_is_null_xptr` and throws an error in the case that the xptr is NULL.

Value

Logical indicating whether the object is a null externalptr

<code>py_iterator</code>	<i>Create a Python iterator from an R function</i>
--------------------------	--

Description

Create a Python iterator from an R function

Usage

```
py_iterator(fn, completed = NULL)
```

Arguments

<code>fn</code>	R function with no arguments.
<code>completed</code>	Special sentinel return value which indicates that iteration is complete (defaults to NULL)

Details

Python generators are functions that implement the Python iterator protocol. In Python, values are returned using the `yield` keyword. In R, values are simply returned from the function.

In Python, the `yield` keyword enables successive iterations to use the state of previous iterations. In R, this can be done by returning a function that mutates its enclosing environment via the `<->` operator. For example:

```
sequence_generator <- function(start) {  
  value <- start  
  function() {  
    value <-> value + 1  
    value  
  }  
}
```

Then create an iterator using `py_iterator()`:

```
g <- py_iterator(sequence_generator(10))
```

Value

Python iterator which calls the R function for each iteration.

Ending Iteration

In Python, returning from a function without calling `yield` indicates the end of the iteration. In R however, `return` is used to yield values, so the end of iteration is indicated by a special return value (`NULL` by default, however this can be changed using the `completed` parameter). For example:

```
sequence_generator <-function(start) {
  value <- start
  function() {
    value <~- value + 1
    if (value < 100)
      value
    else
      NULL
  }
}
```

Threading

Some Python APIs use generators to parallelize operations by calling the generator on a background thread and then consuming its results on the foreground thread. The `py_iterator()` function creates threadsafe iterators by ensuring that the R function is always called on the main thread (to be compatible with R's single-threaded runtime) even if the generator is run on a background thread.

py_last_error

Get or clear the last Python error encountered

Description

Get or clear the last Python error encountered

Usage

```
py_last_error()
py_clear_last_error()
```

Value

For `py_last_error()`, a list with the type, value, and traceback for the last Python error encountered (can be `NULL` if no error has yet been encountered).

py_len	<i>Length of Python object</i>
--------	--------------------------------

Description

Get the length of a Python object (equivalent to the Python `len()` built in function).

Usage

```
py_len(x)
```

Arguments

x Python object

Value

Length as integer

py_list_attributes	<i>List all attributes of a Python object</i>
--------------------	---

Description

List all attributes of a Python object

Usage

```
py_list_attributes(x)
```

Arguments

x Python object

Value

Character vector of attributes

`py_main_thread_func` *Create a Python function that will always be called on the main thread*

Description

This function is helpful when you need to provide a callback to a Python library which may invoke the callback on a background thread. As R functions must run on the main thread, wrapping the R function with `py_main_thread_func()` will ensure that R code is only executed on the main thread.

Usage

```
py_main_thread_func(f)
```

Arguments

`f` An R function with arbitrary arguments

Value

A Python function that delegates to the passed R function, which is guaranteed to always be called on the main thread.

`py_module_available` *Check if a Python module is available on this system.*

Description

Check if a Python module is available on this system.

Usage

```
py_module_available(module)
```

Arguments

`module` Name of module

Value

Logical indicating whether module is available

py_run*Run Python code*

Description

Execute code within the the `__main__` Python module.

Usage

```
py_run_string(code, local = FALSE, convert = TRUE)  
py_run_file(file, local = FALSE, convert = TRUE)  
py_eval(code, convert = TRUE)
```

Arguments

code	Code to execute
local	Whether to create objects in a local/private namespace (if FALSE, objects are created within the main module).
convert	TRUE to automatically convert Python objects to their R equivalent. If you pass FALSE you can do manual conversion using the py_to_r() function.
file	Source file

Value

For `py_eval()`, the result of evaluating the expression; For `py_run_string()` and `py_run_file()`, the dictionary associated with the code execution.

py_save_object*Save and load Python objects with pickle*

Description

Save and load Python objects with pickle

Usage

```
py_save_object(object, filename, pickle = "pickle", ...)  
py_load_object(filename, pickle = "pickle", ...)
```

Arguments

<code>object</code>	Object to save
<code>filename</code>	File name
<code>pickle</code>	The implementation of pickle to use (defaults to "pickle" but could e.g. also be "cPickle")
<code>...</code>	Optional arguments to be passed to the <code>load()</code> function defined by the associated pickle module.

`py_set_attr`*Set an attribute of a Python object***Description**

Set an attribute of a Python object

Usage

```
py_set_attr(x, name, value)
```

Arguments

<code>x</code>	Python object
<code>name</code>	Attribute name
<code>value</code>	Attribute value

`py_set_item`*Set an item for a Python object***Description**

Set an item on a Python object, similar to how `x[name] = value` might be used in Python code to set an item called `name` with value `value` on object `x`. The object's `__setitem__` method will be called.

Usage

```
py_set_item(x, name, value)
```

Arguments

<code>x</code>	A Python object.
<code>name</code>	The item name.
<code>value</code>	The item value.

Value

The (mutated) object x, invisibly.

See Also

Other item-related APIs: [py_del_item\(\)](#), [py_get_item\(\)](#)

py_set_seed

Set Python and NumPy random seeds

Description

Set various random seeds required to ensure reproducible results. The provided seed value will establish a new random seed for Python and NumPy, and will also (by default) disable hash randomization.

Usage

```
py_set_seed(seed, disable_hash_randomization = TRUE)
```

Arguments

seed A single value, interpreted as an integer

disable_hash_randomization

Disable hash randomization, which is another common source of variable results. See <https://docs.python.org/3.4/using/cmdline.html#envvar-PYTHONHASHSEED>

Details

This function does not set the R random seed, for that you should call [set.seed\(\)](#).

py_str

An S3 method for getting the string representation of a Python object

Description

An S3 method for getting the string representation of a Python object

Usage

```
py_str(object, ...)
```

Arguments

object Python object

... Unused

Details

The default implementation will call `PyObject_Str` on the object.

Value

Character vector

`py_suppress_warnings` *Suppress Python warnings for an expression*

Description

Suppress Python warnings for an expression

Usage

`py_suppress_warnings(expr)`

Arguments

`expr` Expression to suppress warnings for

Value

Result of evaluating expression

`py_unicode` *Convert to Python Unicode Object*

Description

Convert to Python Unicode Object

Usage

`py_unicode(str)`

Arguments

`str` Single element character vector to convert

Details

By default R character vectors are converted to Python strings. In Python 3 these values are unicode objects however in Python 2 they are 8-bit string objects. This function enables you to obtain a Python unicode object from an R character vector when running under Python 2 (under Python 3 a standard Python string object is returned).

r-py-conversion *Convert between Python and R objects*

Description

Convert between Python and R objects

Usage

```
r_to_py(x, convert = FALSE)  
py_to_r(x)
```

Arguments

x	A Python object.
convert	TRUE to automatically convert Python objects to their R equivalent. If you pass FALSE you can do manual conversion using the py_to_r() function.

Value

An R object, as converted from the Python object.

repl_python *Run a Python REPL*

Description

This function provides a Python REPL in the R session, which can be used to interactively run Python code. All code executed within the REPL is run within the Python main module, and any generated Python objects will persist in the Python session after the REPL is detached.

Usage

```
repl_python(  
  module = NULL,  
  quiet = getOption("reticulate.repl.quiet", default = FALSE)  
)
```

Arguments

module	An (optional) Python module to be imported before the REPL is launched.
quiet	Boolean; print a startup banner when launching the REPL? If TRUE, the banner will be suppressed.

Details

When working with R and Python scripts interactively, one can activate the Python REPL with `repl_python()`, run Python code, and later run `exit` to return to the R console.

See Also

[py](#), for accessing objects created using the Python REPL.

Examples

```
## Not run:

# enter the Python REPL, create a dictionary, and exit
repl_python()
dictionary = {'alpha': 1, 'beta': 2}
exit

# access the created dictionary from R
py$dictionary
# $alpha
# [1] 1
#
# $beta
# [1] 2

## End(Not run)
```

Description

R interface to Python modules, classes, and functions. When calling into Python R data types are automatically converted to their equivalent Python types. When values are returned from Python to R they are converted back to R types. The reticulate package is compatible with all versions of Python ≥ 2.7 . Integration with NumPy requires NumPy version 1.6 or higher.

source_python	<i>Read and evaluate a Python script</i>
---------------	--

Description

Evaluate a Python script within the Python main module, then make all public (non-module) objects within the main Python module available within the specified R environment.

Usage

```
source_python(file, envir = parent.frame(), convert = TRUE)
```

Arguments

file	Source file
envir	The environment to assign Python objects into (for example, <code>parent.frame()</code> or <code>globalenv()</code>). Specify <code>NULL</code> to not assign Python objects.
convert	<code>TRUE</code> to automatically convert Python objects to their R equivalent. If you pass <code>FALSE</code> you can do manual conversion using the py_to_r() function.

Details

To prevent assignment of objects into R, pass `NULL` for the `envir` parameter.

tuple	<i>Create Python tuple</i>
-------	----------------------------

Description

Create a Python tuple object

Usage

```
tuple(..., convert = FALSE)
```

Arguments

...	Values for tuple (or a single list to be converted to a tuple).
convert	<code>TRUE</code> to automatically convert Python objects to their R equivalent. If you pass <code>FALSE</code> you can do manual conversion using the py_to_r() function.

Value

A Python tuple

Note

The returned tuple will not automatically convert its elements from Python to R. You can do manual conversion with the [py_to_r\(\)](#) function or pass `convert = TRUE` to request automatic conversion.

use_python*Configure which version of Python to use*

Description

Configure which version of Python to use

Usage

```
use_python(python, required = FALSE)

use_virtualenv(virtualenv = NULL, required = FALSE)

use_condaenv(condaenv = NULL, conda = "auto", required = FALSE)

use_miniconda(condaenv = NULL, required = FALSE)
```

Arguments

python	Path to Python binary
required	Is this version of Python required? If TRUE then an error occurs if it's not located. Otherwise, the version is taken as a hint only and scanning for other versions will still proceed.
virtualenv	Directory of Python virtualenv
condaenv	Name of Conda environment
conda	Conda executable. Default is "auto", which checks the PATH as well as other standard locations for Anaconda installations.

virtualenv-tools*Interface to Python Virtual Environments*

Description

R functions for managing Python [virtual environments](#).

Usage

```

virtualenv_list()

virtualenv_create(envname = NULL, python = NULL)

virtualenv_install(
  envname = NULL,
  packages,
  ignore_installed = FALSE,
  pip_options = character(),
  ...
)

virtualenv_remove(envname = NULL, packages = NULL, confirm = interactive())

virtualenv_root()

virtualenv_python(envname = NULL)

```

Arguments

<code>envname</code>	The name of, or path to, a Python virtual environment. If this name contains any slashes, the name will be interpreted as a path; if the name does not contain slashes, it will be treated as a virtual environment within <code>virtualenv_root()</code> . When <code>NULL</code> , the virtual environment as specified by the <code>RETICULATE_PYTHON_ENV</code> environment variable will be used instead.
<code>python</code>	The path to a Python interpreter, to be used with the created virtual environment. When <code>NULL</code> , the Python interpreter associated with the current session will be used.
<code>packages</code>	A character vector with package names to install or remove.
<code>ignore_installed</code>	Boolean; ignore previously-installed versions of the requested packages? (This should normally be <code>TRUE</code> , so that pre-installed packages available in the site libraries are ignored and hence packages are installed into the virtual environment.)
<code>pip_options</code>	An optional character vector of additional command line arguments to be passed to <code>pip</code> .
<code>...</code>	Optional arguments; currently ignored for future expansion.
<code>confirm</code>	Boolean; confirm before removing packages or virtual environments?

Details

Virtual environments are by default located at `~/.virtualenvs` (accessed with the `virtualenv_root` function). You can change the default location by defining defining the `WORKON_HOME` environment variable.

Virtual environment functions are not supported on Windows (the use of [conda environments](#) is recommended on Windows).

with.python.builtin.object

Evaluate an expression within a context.

Description

The `with` method for objects of type `python.builtin.object` implements the context manager protocol used by the Python `with` statement. The passed object must implement the [context manager](#) (`__enter__` and `__exit__` methods).

Usage

```
## S3 method for class 'python.builtin.object'  
with(data, expr, as = NULL, ...)
```

Arguments

<code>data</code>	Context to enter and exit
<code>expr</code>	Expression to evaluate within the context
<code>as</code>	Name of variable to assign context to for the duration of the expression's evaluation (optional).
<code>...</code>	Unused
