# Package 'tensorsparse'

March 22, 2020

Type Package

Version 2.0

Title Multiway Clustering via Tensor Block Models

<b>Date</b> 2020-03-20		
Author Miaoyan Wang, Yuchen Zeng		
Maintainer Yuchen Zeng <yzeng58@wisc.edu></yzeng58@wisc.edu>		
Imports fields, glmnet, rgl, reshape, mvtnorm, HDCI, parallel, RColorBrewer, viridis, methods, stats, utils		
Suggests cluster		
<b>Description</b> Implements the multiway sparse clustering approach of M. Wang and Y. Zeng, "Multiway clustering via tensor block models". Advances in Neural Information Processing System 32 (NeurIPS), 715-725, 2019.

2 choosekrl\_bic

choosekrl\_bic

Select the clustering size for sparse tensor clustering via BIC

## Description

Select the clustering size for three-way clustering. The function searches over a range of clustering sizes and outputs the one that minimizes BIC. The clustering size  $(d_1, d_2, d_3)$  is a length-3 vector consisting of the number of clusters in each mode.

#### Usage

```
choosekrl_bic(
    x,
    k,
    r,
    l,
    lambda = 0,
    sim.times = 1,
    method = "L0",
    n.cores = NULL
)
```

## Arguments

X	a three-dimensional array
k	a vector, the possible numbers of clusters at mode 1
r	a vector, the possible numbers of clusters at mode 2
1	a vector, the possible numbers of clusters at mode 3
lambda	a numeric value, regularization coefficient
sim.times	the number of simulation replicates when performing clustering
method	two options: "L0", "L1". "L0" indicates L0 penalty, and "L1" indicates Lasso penalty
n.cores	the number of cores in parallel implementation

#### Value

```
a list
estimated_krl a 1*3 matrix consisting of the estimated clustering size
BIC a vector consisting of the BIC value for all combinations of clustering sizes
```

chooseLambda 3

	Select the regularization coefficient for sparse tensor clustering via BIC
--	-------------------------------------------------------------------------------

## Description

Select the regularization coefficient for three-way clustering. The clustering size is assumed to be known. The function searches over a range of regularization sizes and outputs the one that minimizes the BIC.

#### Usage

```
chooseLambda(x, k, r, 1, lambda = NULL, method = "L0")
```

#### Arguments

x	a three-dimensional array
k	an positive integer, the numbers of clusters at mode 1
r	an positive integer, the numbers of clusters at mode 2
1	an positive integer, the numbers of clusters at mode 3
lambda	a vector of possible lambda, eg: lambda = $c(0,50,100,200)$
method	two options: "L0", "L1". "L0" indicates L0 penalty, and "L1" indicates Lasso penalty

#### Value

a list

lambda the lambda with lowest BIC

BIC the BIC for each lambda in the given range

nonzeromus the number of clusters with non-zero means

get_data	Generate a random order-3 tensor	

#### Description

Generate an order-3 random tensor based on tensor block model.

get\_data

#### Usage

```
get_data(
    n,
    p,
    q,
    k = NULL,
    r = NULL,
    l = NULL,
    error = 3,
    sort = TRUE,
    sparse.percent = 0,
    center = FALSE,
    seed = NULL,
    mumin = -3,
    mumax = 3
)
```

#### **Arguments**

n	the dimension at mode 1
p	the dimension at mode 2
q	the dimension at mode 3
L	on mositive integer the m

k an positive integer, the numbers of clusters at mode 1
r an positive integer, the numbers of clusters at mode 2
an positive integer, the numbers of clusters at mode 3

error a positive numeric value, noise level

sort if TRUE, the tensor entries belonging to the same cluster would be assumed

together

sparse.percent the proportion of zero entries based on the Gaussian tensor block model center if True, the data tensor would be centered to zero-mean before clustering

seed a positive integer, used to specify the random seed mumin a numeric value, the lower bound of the block mean a numeric value, the upper bound of the block mean

#### Value

```
a list
x the tensor
truthX the underlying signal tensor following block model
truthCs true cluster label assignment at mode 1
truthDs true cluster label assignment at mode 2
truthEs true cluster label assignment at mode 3
mus the block means
binaryX the 0-1 tensor (0:the mean signal = 0; 1:the mean signal != 0)
```

get\_data4 5

## Examples

```
get_data(20,20,20,2,2,2)$x
```

get\_data4

Generate a random order-4 tensor

## Description

Generate a random order-4 tensor based on tensor block model.

#### Usage

```
get_data4(
 n,
 p,
 q,
 s,
 k = NULL
 r = NULL,
 1 = NULL
 m = NULL,
 error = 3,
  sort = TRUE,
  sparse.percent = 0,
  center = FALSE,
  seed = NULL,
 mumin = -3,
 mumax = 3
)
```

### Arguments

n	the dimension at mode 1
p	the dimension at mode 2
q	the dimension at mode 3
S	the dimension at mode 4
k	an positive integer, the numbers of clusters at mode 1
r	an positive integer, the numbers of clusters at mode 2
1	an positive integer, the numbers of clusters at mode 3
m	an positive integer, the numbers of clusters at mode 4
error	a positive numeric value, noise level
sort	if TRUE, the tensor entries belonging to the same cluster would be assumed together

6 tbm\_clustering

```
sparse.percent the proportion of zero entries based on the Gaussian tensor block model
center if True, the data tensor would be centered to zero-mean before clustering
seed a positive integer, used to specify the random seed
mumin a numeric value, the lower bound of the block mean
a numeric value, the upper bound of the block mean
```

#### Value

```
a list
x the tensor
truthX the underlying signal tensor following block model
truthCs true cluster label assignment at mode 1
truthDs true cluster label assignment at mode 2
truthEs true cluster label assignment at mode 3
truthFs true cluster label assignment at mode 4
mus the block means
binaryX the 0-1 tensor (0:the mean signal = 0; 1:the mean signal != 0)
```

tbm\_clustering

Perform tensor clustering via tensor block model (TBM)

#### **Description**

Perform tensor clustering via tensor block model (TBM) method.

#### Usage

```
tbm_clustering(
    x,
    k,
    r,
    l,
    lambda = 0,
    max.iter = 1000,
    threshold = 1e-10,
    sim.times = 1,
    trace = FALSE,
    Cs.init = NULL,
    Ds.init = NULL,
    Es.init = NULL,
    method = "L0"
)
```

tbm\_clustering 7

## Arguments

X	an order-3 data tensor
k	an positive integer, the numbers of clusters at mode 1
r	an positive integer, the numbers of clusters at mode 2
1	an positive integer, the numbers of clusters at mode 3
lambda	a numeric value, regularization coefficient
max.iter	a positive integer, the maximum numbers of iteration
threshold	a positive small numeric value for convergence threshold
sim.times	the number of simulation replicates when performing clustering
trace	logic value, print result per each iteration if TRUE
Cs.init	vector or NULL, initial cluster label assignment at mode 1
Ds.init	vector or NULL, initial cluster label assignment at mode 2
Es.init	vector or NULL, initial cluster label assignment at mode 3
method	two options: "L0", "L1". "L0" indicates L0 penalty, and "L1" indicates Lasso penalty

#### Value

a list
judgeX estimated underlying signal tensor
Cs clustering result at mode 1
Ds clustering result at mode 2
Es clustering result at mode 3
mus estimated block means
