

# Text Plots

Jan Wijffels

---

## Abstract

The textplot R package allows one to visualise complex relations in texts. This is done by providing functionalities for displaying text co-occurrence networks, text correlation networks, dependency relationships as well as text clustering. In this vignette, some example visualisations of these are shown.

*Keywords:* Text, network, co-occurrence, correlation, text clustering, dependency parsing, visualisation.

---

## 1. General

### 1.1. Overview

The package allows you to visualise

- Text frequencies
- Text correlations
- Text cooccurrences
- Text clusters
- Dependency parsing results

*Source code repository*

The source code of the package is on github at <https://github.com/bnosac/textplot>. The R package is distributed under the GPL-2 license.

## 2. Example visualisations

### 2.1. Dependency Parser

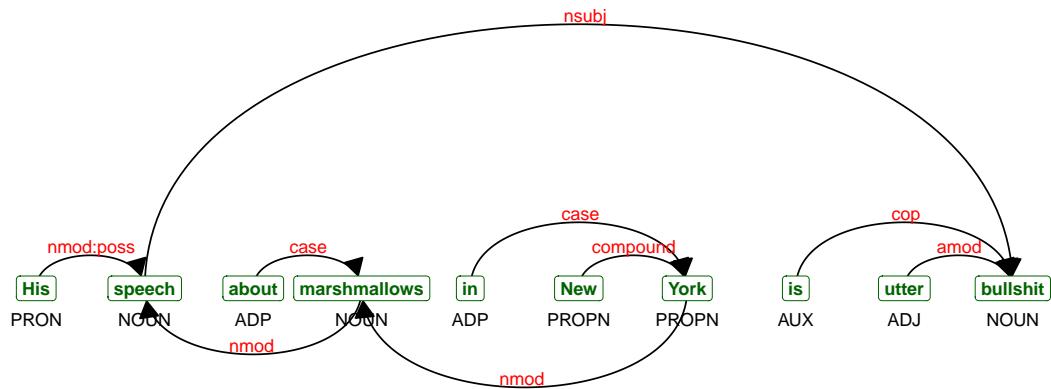

#### *Example 1*

This example visualises the result of a text annotation which provides parts of speech tags and dependency relationships.

```
library(textplot)
library(udpipe)
library(ggraph)
library(ggplot2)
library(igraph)
x <- udpipe("His speech about marshmallows in New York is utter bullshit",
             "english")
plt <- textplot_dependencyparser(x, size = 4)
plt
```

#### Dependency Parser

tokenisation, parts of speech tagging & dependency relations

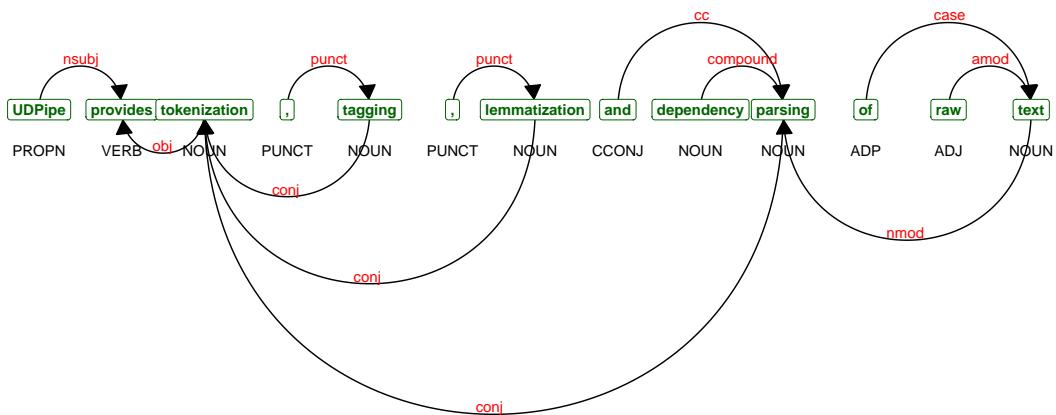

### Example 2

The following visualisation displays the dependency parser results on some larger sentence. Note that this function works only on 1 sentence.

```
x <- udpipe("UDPipe provides tokenization, tagging, lemmatization and
             dependency parsing of raw text", "english")
plt <- textplot_dependencyparser(x, size = 4)
plt
```

### Dependency Parser

tokenisation, parts of speech tagging & dependency relations

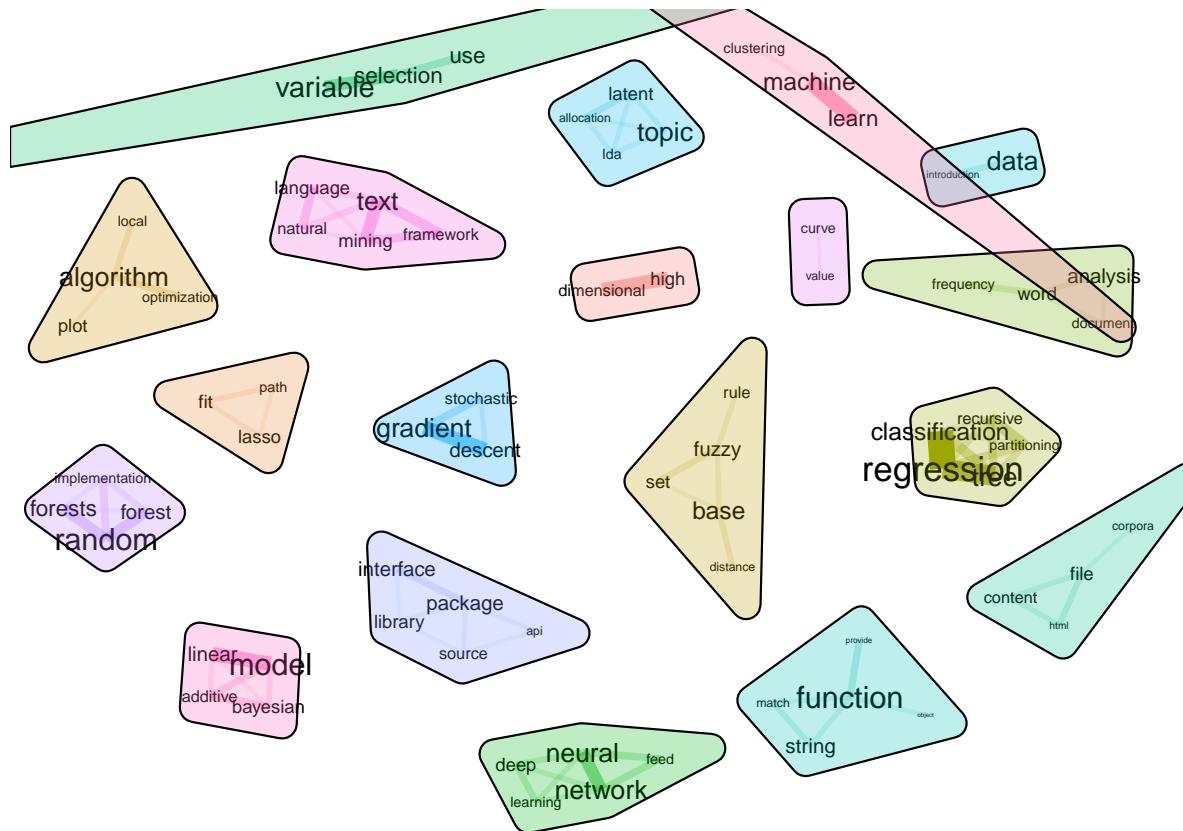

## 2.2. Biterm Topic Model plots

### Example 1

This example shows plotting a biterm topic model which was pretrained and put in the package as an example.

```
library(BTM)
library(ggraph)
library(ggforce)
library(concateman)
library(igraph)
data(example_btm, package = 'textplot')
model <- example_btm
plt <- plot(model, title = "BTM model", top_n = 5)
plt
```

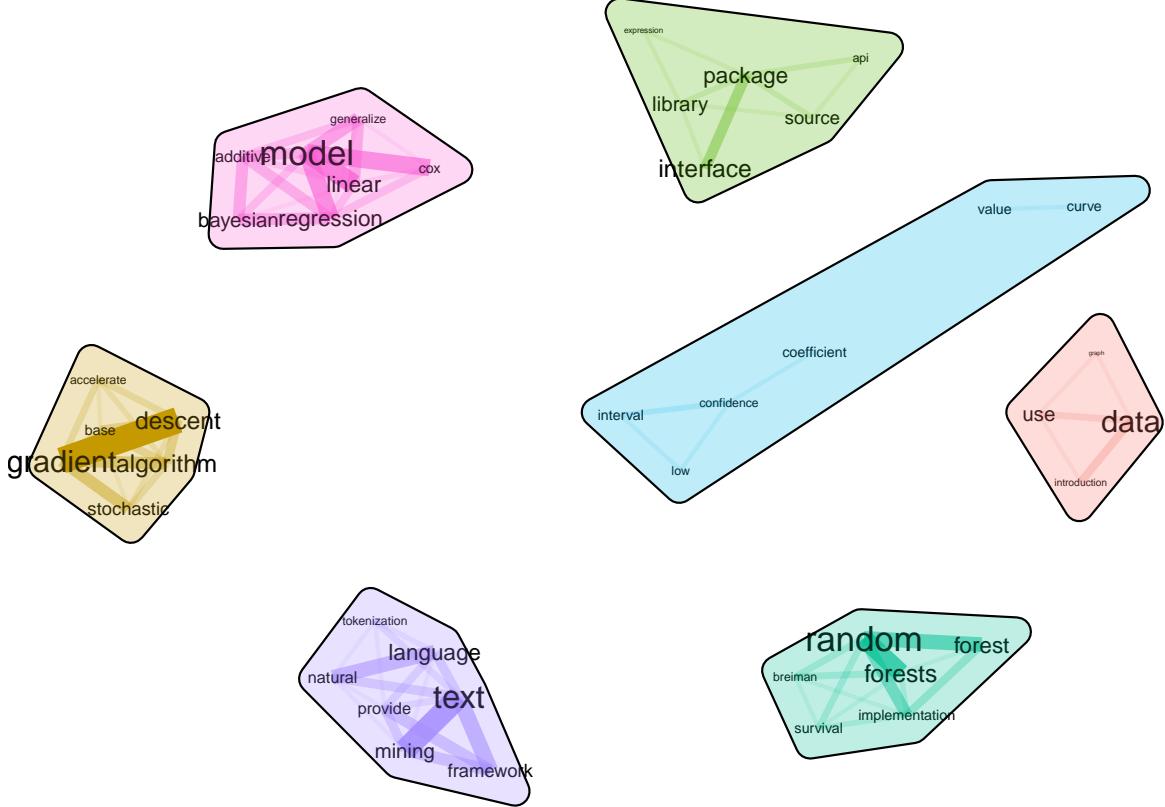

BTM model

```
plt <- plot(model, title = "Biterm topic model", subtitle = "Topics 2 to 8",
            which = 2:8, top_n = 7)
plt
```

### Biterm topic model

Topics 2 to 8

### Example 2

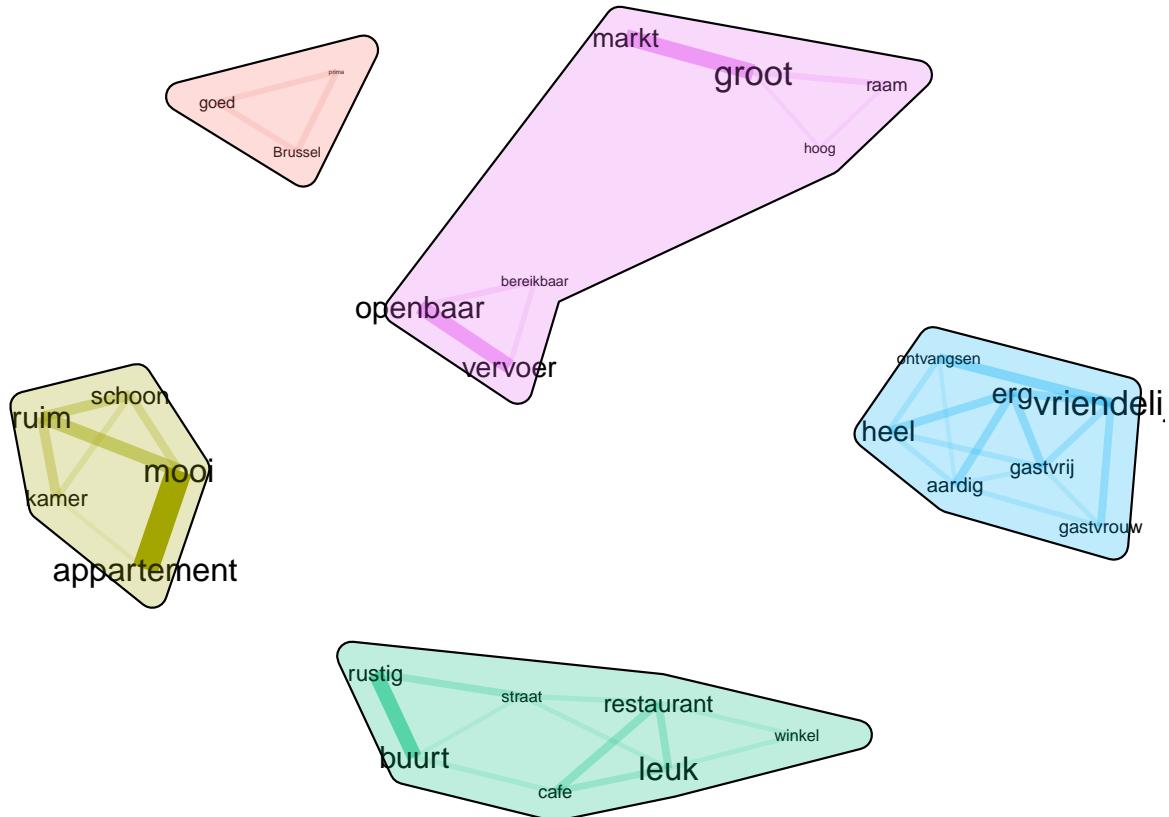

This example shows building a biterm topic model on nouns, adjectives and proper nouns occurring in the neighbourhood of one another and next plotting this model.

```
library(data.table)
library(udpipe)
## Annotate text with parts of speech tags
data("brussels_reviews", package = "udpipe")
anno <- subset(brussels_reviews, language %in% "nl")
anno <- data.frame(doc_id = anno$id, text = anno$feedback, stringsAsFactors = FALSE)
anno <- udpipe(anno, "dutch", trace = 10)
## Get cooccurrences of nouns / adjectives and proper nouns
biterms <- as.data.table(anno)
biterms <- biterms[, cooccurrence(x = lemma,
                                    relevant = upos %in% c("NOUN", "PROPN", "ADJ"),
                                    skipgram = 2),
```

```
by = list(doc_id)]
```

```
library(BTM)
library(ggraph)
library(ggforce)
library(concaveman)
library(igraph)
## Build the BTM model
set.seed(123456)
x <- subset(anno, upos %in% c("NOUN", "PROPN", "ADJ"))
x <- x[, c("doc_id", "lemma")]
model <- BTM(x, k = 5, beta = 0.01, iter = 2000, background = TRUE,
              biterms = biterms, trace = 100)
plt <- plot(model)
plt
```

Biterm topic model

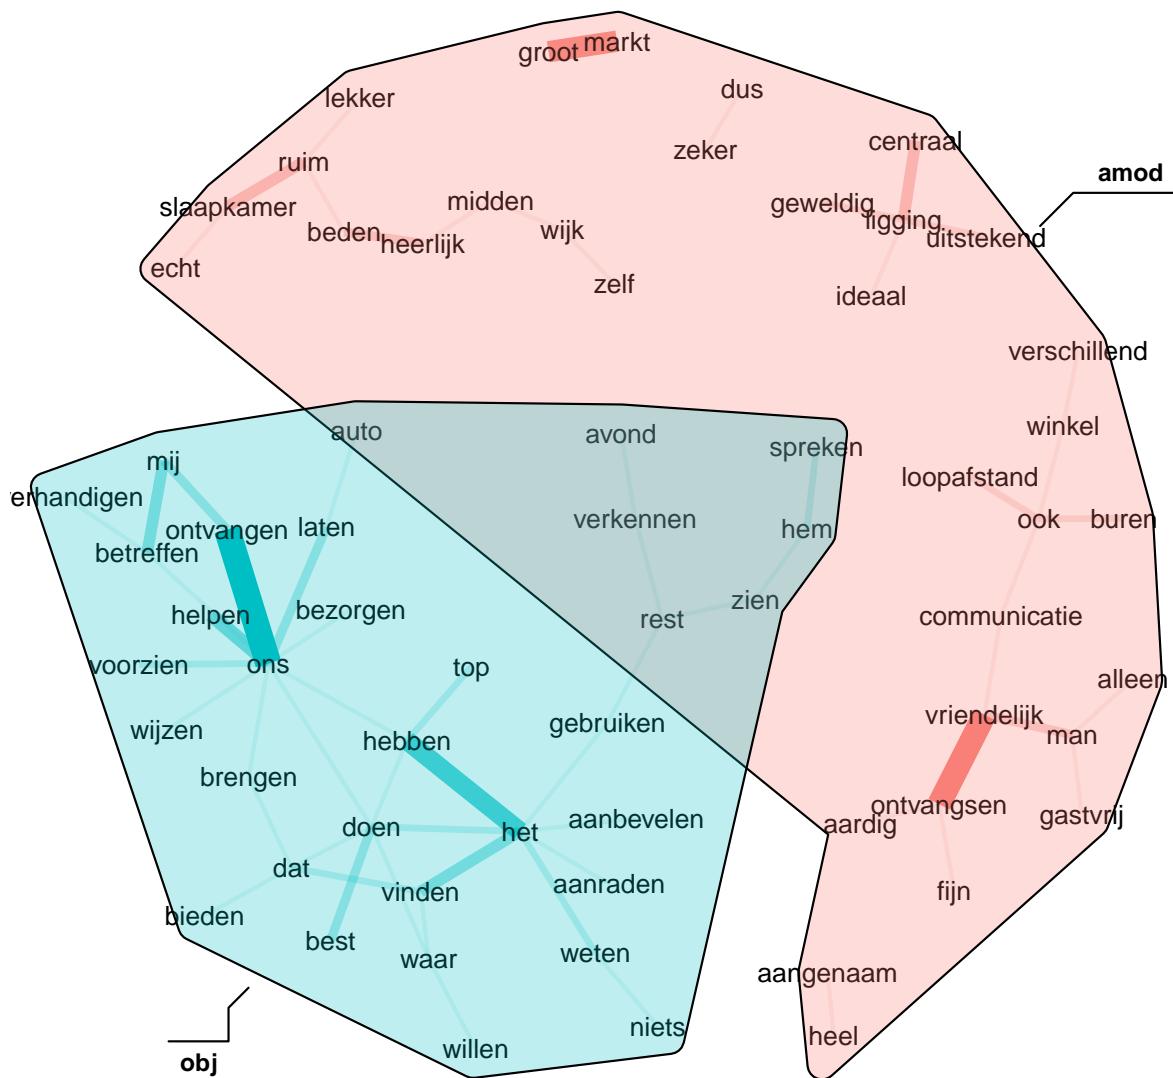

### 2.3. Biterm relationships

*Example showing objects of verbs and adjectives modifying nouns*

The below example shows the objects of verbs as well as which adjectives modify nouns. These are displayed as 2 clusters. We start from the annotation of the AirBnB data shown in the previous section 2.2.2.

## Objects of verbs and adjectives–nouns

## Top 50 by group

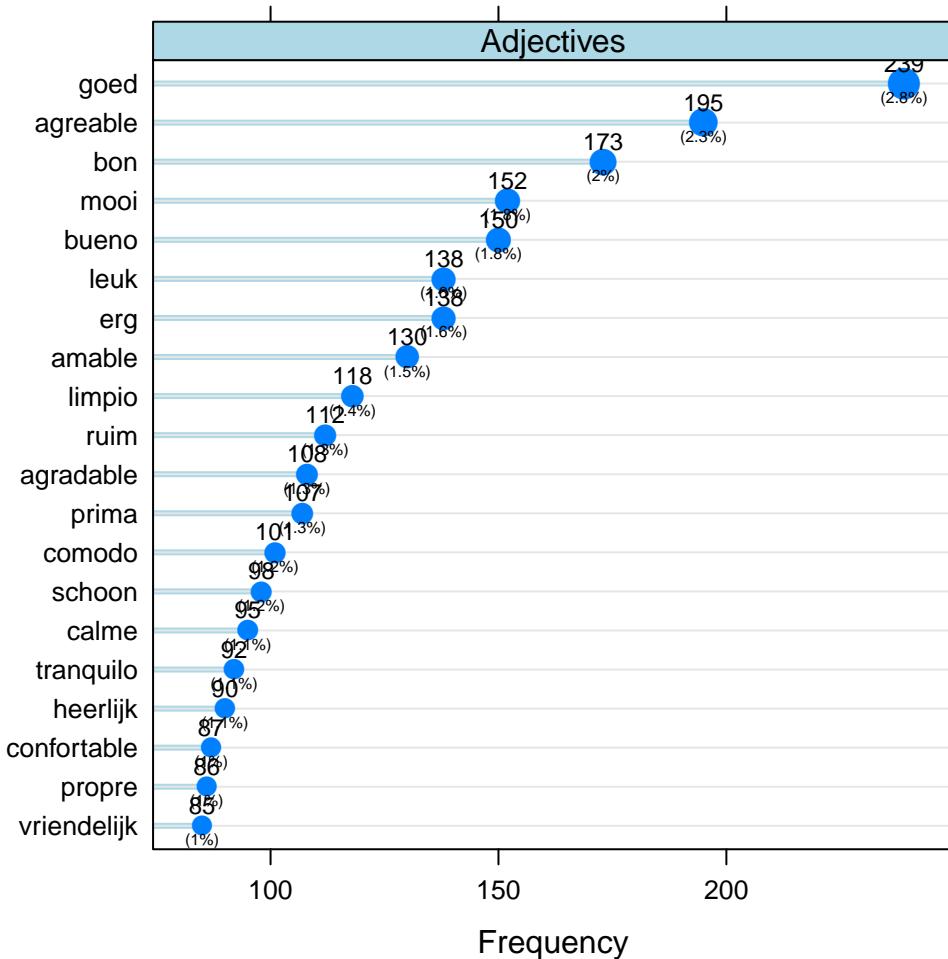

## 2.4. Bar plots

*Example showing frequency of adjectives*

The plot below shows a simple barplot which works on the output of table.

```
library(udpipe)
data("brussels_reviews_anno", package = "udpipe")
x <- subset(brussels_reviews_anno, xpos %in% "JJ")
x <- sort(table(x$lemma))
plt <- textplot_bar(x, top = 20,
                     panel = "Adjectives", xlab = "Frequency",
                     col.panel = "lightblue", cextext = 0.75,
                     addpct = TRUE, cexpct = 0.5)
plt
```

## 2.5. Correlation of texts

*Top correlations above a certain threshold*

Text correlations are interesting to see, but as there are many, the below function allows one to visualise a subset of these, the ones with the highest correlations above a certain threshold.

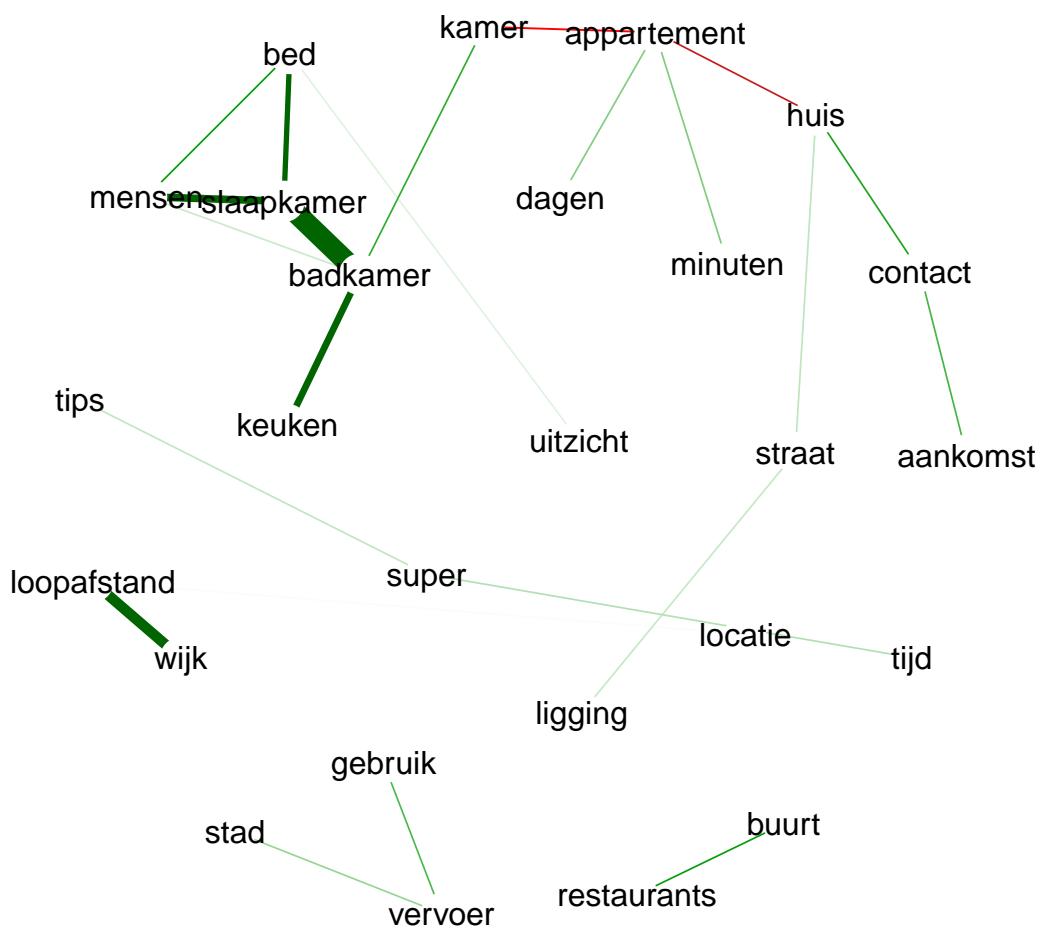

```
library(graph)
library(Rgraphviz)
library(udpipe)
dtm <- subset(anno, upos %in% "ADJ")
dtm <- document_term_frequencies(dtm, document = "doc_id", term = "lemma")
dtm <- document_term_matrix(dtm)
dtm <- dtm_remove_lowfreq(dtm, minfreq = 5)
textplot_correlation_lines(dtm, top_n = 25, threshold = 0.01, lwd = 5, label = TRUE)
```

### Correlations which are non-zero after fitting a glasso model

If you have text correlations, you can also fit a glasso model on it. This puts non-relevant correlations to zero, allowing one to plot the correlations in a straightforward way.

```
library(glasso)
library(qgraph)
library(udpipe)
dtm <- subset(anno, upos %in% "NOUN")
dtm <- document_term_frequencies(dtm, document = "doc_id", term = "token")
dtm <- document_term_matrix(dtm)
dtm <- dtm_remove_lowfreq(dtm, minfreq = 20)
dtm <- dtm_remove_tfidf(dtm, top = 100)
term_correlations <- dtm_cor(dtm)
textplot_correlation_glasso(term_correlations, exclude_zero = TRUE)
```

## 2.6. Co-occurrence of texts

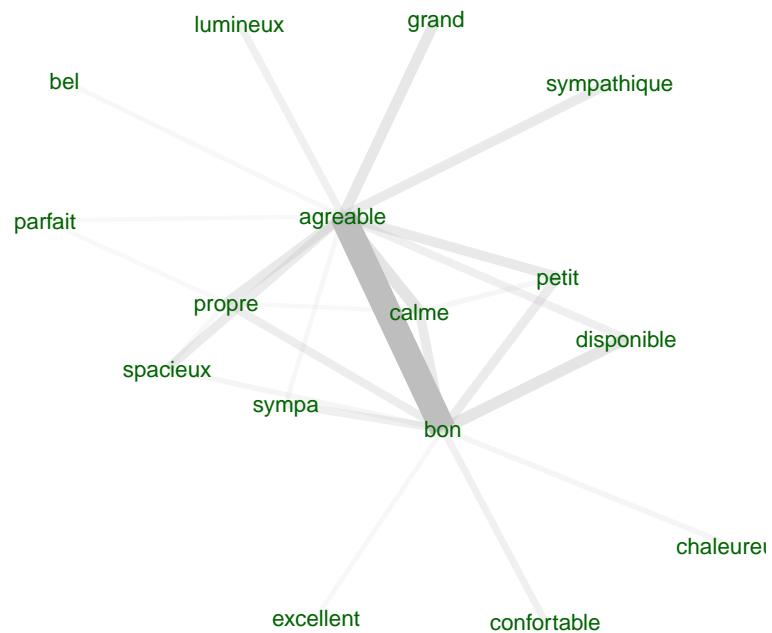

*Example showing adjectives occurring in the same document*

The following graph shows how frequently adjectives co-occur across all the documents.

```
library(udpipe)
library(igraph)
library(ggraph)
library(ggplot2)
data(brussels_reviews_anno, package = 'udpipe')
x <- subset(brussels_reviews_anno, xpos %in% "JJ" & language %in% "fr")
x <- cooccurrence(x, group = "doc_id", term = "lemma")

plt <- textplot_cooccurrence(x,
                             title = "Adjective co-occurrences", top_n = 25)
plt
```

**Adjective co-occurrences**

*Example showing objects of verbs / adjectives modifying nouns on our annotated dataset*

The following graph shows a similar visualisation, but instead focussing on the frequency of objects of verbs and adjectives modifying a noun. For this, we start again from the annotation of the AirBnB data shown in the section 2.2.

```
library(udpipe)
library(igraph)
library(ggraph)
library(ggplot2)
library(data.table)
biterms <- merge(anno, anno,
                  by.x = c("doc_id", "paragraph_id", "sentence_id", "head_token_id"),
                  by.y = c("doc_id", "paragraph_id", "sentence_id", "token_id"),
                  all.x = TRUE, all.y = FALSE, suffixes = c("", "_parent"), sort = FALSE)
biterms <- setDT(biterms)
biterms <- subset(biterms, dep_rel %in% c("obj", "amod"))
biterms <- biterms[, list(cooc = .N), by = list(term1 = lemma, term2 = lemma_parent)]
plt <- textplot_cooccurrence(biterms,
                               title = "Objects of verbs + Adjectives-nouns",
                               top_n = 75,
                               vertex_color = "orange", edge_color = "black",
                               fontface = "bold")
plt
```
