

Package ‘walrus’

June 17, 2018

Type Package

Title Robust Statistical Methods

Version 1.0.3

Author Jonathon Love, Patrick Mair

Maintainer Jonathon Love <jon@thon.cc>

Description A toolbox of common robust statistical tests, including robust descriptives, robust t-tests, and robust ANOVA. It is also available as a module for 'jamovi' (see <<https://www.jamovi.org>> for more information). Walrus is based on the WRS2 package by Patrick Mair, which is in turn based on the scripts and work of Rand Wilcox. These analyses are described in depth in the book 'Introduction to Robust Estimation & Hypothesis Testing'.

walrus-package	<i>Walrus</i>
----------------	---------------

Description

A toolbox of common robust statistical tests, including robust descriptives, robust t-tests, and robust ANOVA. It is also available as a module for 'jamovi' (see www.jamovi.org for more information). Walrus is based on the WRS2 package by Patrick Mair, which is in turn based on the scripts and work of Rand Wilcox. These analyses are described in depth in the book [Introduction to Robust Estimation & Hypothesis Testing](#).

Details

Box & Violin Plots	rplots()
Robust Descriptives	rdesc()
Robust Independent Samples T-Test	rttestIS()
Robust Paired Samples T-Test	rttestIS()
Robust ANOVA	ranova()

Ravi:

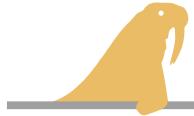

"Should we create a logo for walrus?"

Jonathon:

"Yeah, I guess. Maybe a walrus, or a skewed distribution?

Bonus points if it somehow contains both."

Ravi gets bonus points

anova*Robust ANOVA*

Description

Robust Analysis of Variance

Usage

```
anova(data, dep, factors = NULL, method = "trim", ph = FALSE, tr = 0.2,
      est = "mom", nboot = 599, dist = "proj")
```

Arguments

data	the data as a data frame
dep	a string naming the dependent variable from data; the variable must be numeric
factors	a vector of strings naming the fixed factors from data
method	'median', 'trim' (default) or 'boot'; the method to use, median, trimmed means, or bootstrapped
ph	TRUE or FALSE (default), provide post hoc tests
tr	a number between 0 and 0.5, (default: 0.2), the proportion of measurements to trim from each end, when using the trim and bootstrap methods
est	'onestep', 'mom' (default) or 'median', the M-estimator to use; One-step, Modified one-step or Median respectively
nboot	a number (default: 599) specifying the number of bootstrap samples to use when using the bootstrap method
dist	'maha' or 'proj' (default), whether to use Mahalanobis or Projection distances respectively

Value

A results object containing:

results\$main	the table of ANOVA results
results\$pfs	the table of posthoc tests

Tables can be converted to data frames with `asDF` or [as.data.frame](#). For example:

```
results$main$asDF
as.data.frame(results$main)
```

Examples

```
data('goggles', package='WRS2')
```

```

ranova(goggles,
        dep = 'attractiveness',
        factors = c('gender', 'alcohol'),
        ph = TRUE)

#
# ROBUST ANOVA
#

#   None     4 Pints 35.83 < .001    19.3    52.3
#   2 Pints  4 Pints 39.17 < .001    22.5    55.9
# -----
#

```

Description

Robust Descriptives

Usage

```
rdesc(data, vars, splitBy = NULL, mean = TRUE, trim = TRUE, tr = 0.2,
      win = FALSE, wl = 0.2, mest = FALSE, bend = 1.28, med = FALSE)
```

Arguments

data	the data as a data frame
vars	a vector of strings naming the variables in data of interest
splitBy	a string naming the variable in data to split the data by
mean	TRUE (default) or FALSE, provide a 'normal' arithmetic mean
trim	TRUE (default) or FALSE, provide a trimmed mean
tr	a number between 0 and 0.5 (default: 0.2); the proportion of measurements to trim from each end when producing trimmed means
win	TRUE or FALSE (default), provide a 'Winsorized' mean
wl	a number between 0 and 0.5 (default: 0.2); the level of 'winsorizing' when producing winsorized means
mest	TRUE or FALSE (default), provide an 'M-estimated' value
bend	a number (default: 1.28), the bending constant to use when using M-estimators
med	TRUE or FALSE (default), provide medians

Value

A results object containing:

results\$table	the table of descriptives
----------------	---------------------------

Tables can be converted to data frames with `asDF` or `as.data.frame`. For example:

```
results$table$asDF
as.data.frame(results$table)
```

Examples

```
data('eurosoccer', package='WRS2')

SpainGermany <- subset(eurosoccer, eurosoccer$League == 'Spain' | eurosoccer$League == 'Germany')
SpainGermany <- droplevels(SpainGermany)

walrus::rdesc(
  data = SpainGermany,
  vars = "GoalsGame",
  splitBy = "League",
  med = TRUE)
```

```

#
# ROBUST DESCRIPTIVES
#
# Robust Descriptives
# -----
#                                     SE
# -----
#   GoalsGame    Germany    Mean      1.46   0.105
#                   Trimmed mean 1.45   0.1341
#                   Median     1.43   0.1599
#
#           Spain     Mean      1.45   0.101
#                   Trimmed mean 1.33   0.0601
#                   Median     1.30   0.0766
# -----
#

```

rplots*Box & Violin Plots***Description**

Box & Violin Plots

Usage

```
rplots(data, vars, splitBy = NULL, violin = TRUE, boxplot = FALSE,
      dot = TRUE, dotType = "stack")
```

Arguments

<code>data</code>	the data as a data frame
<code>vars</code>	a vector of strings naming the variables in <code>data</code> of interest
<code>splitBy</code>	a string naming the variable in <code>data</code> to split the data by
<code>violin</code>	TRUE (default) or FALSE, provide violin plots
<code>boxplot</code>	TRUE or FALSE (default), provide box plots
<code>dot</code>	TRUE (default) or FALSE, plot each measurement as a dot
<code>dotType</code>	'jitter' or 'stack' (default); whether data dots are jittered or stacked

Value

A results object containing:

<code>results\$plots</code>	an array of images
-----------------------------	--------------------

Examples

```
data('eurosoccer', package='WRS2')

# violin plots

walrus::rplots(
  data = eurosoccer,
  vars = "GoalsGame",
  splitBy = "League")

# box plots

walrus::rplots(
  data = eurosoccer,
  vars = "GoalsGame",
  splitBy = "League",
  violin = FALSE,
  boxplot = TRUE,
  dot = FALSE)
```

rttestIS

Robust Independent Samples T-Test

Description

Robust Independent Samples T-Test

Usage

```
rttestIS(data, deps, group, yuen = TRUE, tr = 0.2, mest = FALSE,
  method = "mom", yuenbt = FALSE, nboot = 599, md = FALSE, ci = FALSE,
  es = FALSE, esci = FALSE)
```

Arguments

<code>data</code>	the data as a data frame
<code>deps</code>	a vector of strings naming the dependent variables in <code>data</code>
<code>group</code>	a string naming the grouping variable in <code>data</code> ; must have 2 levels
<code>yuen</code>	TRUE (default) or FALSE, use the Yuen's trim method
<code>tr</code>	a number between 0 and 0.5, (default: 0.2), the proportion of measurements to trim from each end, when using the trim and bootstrap methods
<code>mest</code>	TRUE or FALSE (default), use an M-estimator
<code>method</code>	'onestep', 'mom' (default) or 'median', the M-estimator to use; One-step, Modified one-step or Median respectively

yuenbt	TRUE or FALSE (default), use the Yuen's bootstrap method
nboot	a number (default: 599) specifying the number of bootstrap samples to use when using the bootstrap method
md	TRUE or FALSE (default), provide the mean difference
ci	TRUE or FALSE (default), provide a 95% confidence interval on the mean difference
es	TRUE or FALSE (default), provide the effect-size
esci	TRUE or FALSE (default), provide a 95% confidence interval on the effect-size

Value

A results object containing:

results\$ttest	the table of t-test results
----------------	-----------------------------

Tables can be converted to data frames with `asDF` or [as.data.frame](#). For example:

```
results$ttest$asDF
as.data.frame(results$ttest)
```

Examples

```
data('eurosoccer', package='WRS2')

SpainGermany <- subset(eurosoccer, eurosoccer$League == 'Spain' | eurosoccer$League == 'Germany')
SpainGermany <- droplevels(SpainGermany)

rttestIS(SpainGermany,
         dep = 'GoalsScored',
         group = 'League',
         yuen = TRUE,
         mest = TRUE)

#
# ROBUST INDEPENDENT SAMPLES T-TEST
#
# Robust Independent Samples T-Test
# -----
#          t      df      p
# -----
#   GoalsScored  Yuen's test  0.297  17.3  0.770
#           M-estimator -0.933          0.993
# -----
```

rttestPS*Robust Paired Samples T-Test*

Description

Robust Paired Samples T-Test

Usage

```
rttestPS(data, pairs, tr = 0.2, md = FALSE, es = FALSE, ci = FALSE)
```

Arguments

data	the data as a data frame
pairs	a list of lists specifying the pairs of measurement in data
tr	a number between 0 and 0.5, (default: 0.2), the proportion of measurements to trim from each end, when using the trim and bootstrap methods
md	TRUE or FALSE (default), provide means and standard errors
es	TRUE or FALSE (default), provide effect sizes
ci	TRUE or FALSE (default), provide confidence intervals

Value

A results object containing:

results\$ttest	the table of t-test results
----------------	-----------------------------

Tables can be converted to data frames with `asDF` or [as.data.frame](#). For example:

```
results$ttest$asDF
as.data.frame(results$ttest)
```

Examples

```
data(anorexia, package='MASS')
anorexiaFT <- subset(anorexia, subset = Treat == "FT")

rttestPS(anorexiaFT,
         pairs = list(
           list(i1 = 'Prewt', i2 = 'Postwt')))

#
# ROBUST PAIRED SAMPLES T-TEST
#
# Robust Paired Samples T-Test
# -----
```

10

rttestPS

```
#          t      df      p
# -----#
#   Prewt  Postwt -3.83  10.0  0.003
# -----#
```
