Package 'wsyn'

December 18, 2019

Version 1.0.2

Type Package

Title Wavelet Approaches to Studies of Synchrony in Ecology and Other Fields

Description Tools for a wavelet-based approach to analyzing spatial synchrony, principally in ecological data. Some tools will be useful for studying community synchrony. See, for instance, Sheppard et al (2016) <doi: 10.1038/NCLIMATE2991>, Sheppard et al (2017) <doi: 10.1051/epjnbp/2017000>, Sheppard et al (2019) <doi: 10.1371/journal.pcbi.1006744>.

addranks *Adds rank information to a* coh *or* wlmtest *object*

Description

When a coh or wlmtets object is created, the ranks slot is NA. This function fills it in.

Usage

```
addranks(obj)
```

Arguments

obj	An object of class coh or wlmtest

Value

addranks returns another coh or wlmtest object with ranks slot now included. If obj$ranks was not NA, the object is returned as is.

Note

Internal function, no error checking performed

Author(s)

Thomas Anderson, <anderstl@gmail.com>, Jon Walter, <jaw3es@virginia.edu>; Lawrence Sheppard, <lwsheppard@ku.edu>; Daniel Reuman, <reuman@ku.edu>

See Also

---

addwmfs *Adds wavelet mean field information to a* clust *object*

Description

When a clust object is created, the wmfs slot is NA. This function fills it in.

Usage

```
addwmfs(obj)
```

Arguments

obj	An object of class clust

Details

This function uses the values of scale.min, scale.max.input, sigma and f0 stored in obj$methodspecs. It is possible to create a clust object with bad values for these slots. This function throws an error in that case. You can use a correlation-based method for calculating the synchrony matrix and still pass values of scale.min, scale.max.input, sigma and f0 to clust (in fact, this happens by default) - they won't be used by clust, but they will be there for later use by addwmfs and addwpmfs.

Value

addwmfs returns another clust object with wmfs slot now included. If obj$wmfs was not NA, the object is returned as is.

Author(s)

Daniel Reuman, <reuman@ku.edu>

clust, addwpmfs, browseVignettes("wsyn")

Examples

```
sig<-matrix(.8,5,5)
diag(sig)<-1
lents<-50
dat1<-t(mvtnorm::rmvnorm(lents,mean=rep(0,5),sigma=sig))
dat2<-t(mvtnorm::rmvnorm(lents,mean=rep(0,5),sigma=sig))
dat<-rbind(dat1,dat2)
times<-1:lents
dat<-cleandat(dat,times,clev=1)$cdat
coords<-data.frame(Y=rep(0,10),X=1:10)
method<-"coh.sig.fast"
clustobj<-clust(dat,times,coords,method,nsurrogs = 100)
res<-addwmfs(clustobj)
```

---

addwpmfs *Adds wavelet phasor mean field information to a* clust *object*

Description

When a clust object is created, the wpmfs slot is NA. This function fills it in, or adds to it.

Usage

```
addwpmfs(obj, level = 1:length(obj$clusters), sigmethod = "quick",
  nrand = 1000)
```

Arguments

obj	An object of class clust
level	The clustering level(s) to use. 1 corresponds to no clustering. The default is all levels of clustering.
sigmethod	Method for significance testing the wpmf, one of quick, fft, aaft (see details of the wpmf function)
nrand	The number of randomizations to be used for significance testing

Details

This function uses the values of scale.min, scale.max.input, sigma and f0 stored in obj$methodspecs. It is possible to create a clust object with bad values for these slots. This function throws an error in that case. You can use a correlation-based method for calculating the synchrony matrix and still pass values of scale.min, scale.max.input, sigma and f0 to clust (in fact, this happens by default) - they won't be used by clust, but they will be there for later use by addwmfs and addwpmfs.

Value

addwpmfs returns another clust object with wpmfs slot now included, or more filled in than it was previously. With values of sigmethod other than "quick", this function can be slow, particularly with large nrand. So in that case the user may want to set level equal only to one clustering level of interest. Unlike wmf, old values in obj$wpmfs are overwritten.

bandtest *Aggregate significance across a timescale band*

Description

Computes the aggregate significance of coherence (coh) or of a wavelet linear model test object (wlmtest) across a timescale band, accounting for non-independence of timescales. Also gets the average phase across the band, in the case of coherence.

Usage

```
bandtest(object, ...)

## Default S3 method:
bandtest(object, ...)

## S3 method for class 'coh'
bandtest(object, band, ...)

## S3 method for class 'wlmtest'
bandtest(object, band, ...)
```

Arguments

object	An object of class coh or wlmtest, must have a non-NA signif slot
...	Passed from the generic to specific methods. Not currently used.
band	A length-two numeric vector indicating a timescale band

Value

bandtest returns an object of the same class as its first input but with a bandp slot added. Or if there was already a bandp slot, the output has a bandp slot with an additional row. For a coh object, the bandp slot is a data frame with four columns, the first two indicating the timescale band and the third an associated p-value for the test of coherence over that band. The fourth column is the average phase over the band. For a wlmtest object, the result is only the first three of the above columns.

bctrans *The one-parameter family of Box-Cox transformations*

Description

The one-parameter family of Box-Cox transformations

Usage

```
bctrans(y, lambda)
```

Arguments

y	A numeric, positive values assumed
lambda	The Box-Cox parameter

Details

Internal function. No error checking done. It is assumed the entries of y are positive.

Value

bctrans gives ((y^lambda)-1)/lambda for lambda not 0 or ln(y) for lambda equal to 0.

cleandat, browseVignettes("wsyn")

---

cleandat — *Clean (spatio)temporal data matrices to make them ready for analyses using the* wsyn *package*

Description

A data cleaning function for optimal Box-Cox transformation, detrending, standarizing variance, de-meaning

Usage

```
cleandat(dat, times, clev, lambdas = seq(-10, 10, by = 0.01), mints = NA)
```

Arguments

dat	A locations x time data matrix, or a time series vector (for 1 location)
times	The times of measurement, spacing 1
clev	The level of cleaning to do, 1 through 5. See details.
lambdas	A vector of lambdas to test for optimal Box-Cox transformation, if Box-Cox is performed. Ignored for clev<4. Defaults to seq(-10,10, by=0.01). See details.

`mints` If `clev` is 4 or 5, then time series are shifted to have this minimum value before Box-Cox transformation. Default NA means use the smallest difference between consecutive, distinct sorted values. NaN means perform no shift.

Details

NAs, Infs, etc. in `dat` trigger an error. If `clev==1`, time series are (individually) de-meaned. If `clev==2`, time series are (individually) linearly detrended and de-meaned. If `clev==3`, time series are (individually) linearly detrended and de-meaned, and variances are standardized to 1. If `clev==4`, an optimal Box-Cox normalization procedure is applied jointly to all time series (so the same Box-Cox transformation is applied to all time series after they are individually shifted depending on the value of `mints`). Transformed time series are then individually linearly detrended, de-meaned, and variances are standardized to 1. If `clev==5`, an optimal Box-Cox normalization procedure is applied to each time series individually (again after individually shifting according to `mints`), and transformed time series are then individually linearly detrended, de-meaned, and variances are standardized to 1. Constant time series and perfect linear trends trigger an error for `clev>=3`. If `clev>=4` and the optimal `lambda` for one or more time series is a boundary case or if there is more than one optimal lambda, it triggers a warning. A wider range of `lambda` should be considered in the former case.

Value

`cleandat` returns a list containing the cleaned data, `clev`, and the optimal lambdas from the Box-Cox procedure (`NA` for `clev<4`, see details).

```

```
res5<-cleandat(dat,times,5) #1-3, also indiv Box-Cox
```

`cluseigen` *Community structure detection in networks*

Description

Community structure detection in networks based on the leading eigenvector of the community matrix

Usage

```
cluseigen(adj)
```

Arguments

`adj`	An adjacency matrix. Should be symmetric with diagonal containing zeros.

Details

The difference between this function and the algorithm described by Newman is that this function can be used on an adjacency matrix with negative elements, which is very common for correlation matrices and other measures of pairwise synchrony of time series.

Value

`cluseigen` returns a list with one element for each of the splits performed by the clustering algorithm. Each element is a vector with entries corresponding to rows and columns of adj and indicating the module membership of the node, following the split. The last element of the list is the final clustering determined by the algorithm when its halting condition is satisfied. The first element is always a vector of all 1s (corresponding to before any splits are performed).

z<-cluseigen(adj)
```

`clust` *Detection and description of clusters of synchronous locations*

Description

Generator function for the `clust` S3 class, which supports tools for detecting clusters (aka, modules, sub-networks, communities, etc.) of especially synchronous locations.

Usage

```
clust(dat, times, coords, method, tsrange = c(0, Inf), nsurrogs = 1000,
  scale.min = 2, scale.max.input = NULL, sigma = 1.05, f0 = 1,
  weighted = TRUE, sigthresh = 0.95)
```

Arguments

`dat`	A locations (rows) x time (columns) matrix of measurements
`times`	The times at which measurements were made, spacing 1
`coords`	A data frame containing X,Y coordinates of locations in `data`, with column names either `X` and `Y` or `lon` and `lat` or `longitude` and `latitude`. The data frame may contain other columns with additional metainformation about the sites.
`method`	Method for synchrony calculation. See details.
`tsrange`	A vector containing the min and max of the focal timescale range. Defaults to all timescales that are valid given choices for scale.min, scale.max.input, f0, sigma. Only used for wavelet-based methods.
`nsurrogs`	Number of surrogates for significance test. Defaults to 1000. Only used for surrogate-based methods.
`scale.min`	The smallest scale of fluctuation that will be examined. At least 2. Used only for wavelet-based methods.
`scale.max.input`	The largest scale of fluctuation guaranteed to be examined. Only used for wavelet-based methods.
`sigma`	The ratio of each time scale examined relative to the next timescale. Should be greater than 1. Only used for wavelet-based methods.
`f0`	The ratio of the period of fluctuation to the width of the envelope. Only used for wavelet-based methods.

weighted	If TRUE, create a weighted network. If FALSE, create a binary network using statistical significance. Binary networks are only allowed for networks based on significance.
sigthresh	Significance threshold needed, if weighted is false, for a network link to be realized. Typically 0.95, 0.99, or 0.999, etc. Only used if weighted is FALSE.

Details

The following values are valid for method: "pearson", "pearson.sig.std", "pearson.sig.fft", "pearson.sig.aaft", "spearman", "spearman.sig.std", "spearman.sig.fft", "spearman.sig.aaft", "kendall", "kendall.sig.std", "kendall.sig.fft", "kendall.sig.aaft", "ReXWT", "ReXWT.sig.fft", "ReXWT.sig.aaft", "ReXWT.sig.fast", "coh", "coh.sig.fft", "coh.sig.aaft", "coh.sig.fast", "phasecoh", "phasecoh.sig.fft", and "phasecoh.sig.aaft". The first portions of these identifiers correspond to the Pearson, Spearman, and Kendall correlations, the real part of the cross-wavelet transform, the wavelet coherence, and the wavelet phase coherence. The second portions of these identifiers, when present, indicates that significance of the measure specified in the first portion of the identifies is to be used for establishing the synchrony matrix. Otherwise the value itself is used. The third part of the method identifier indicates what type of significance is used.

Significance testing is performed using standard approaches (method flag containg std; for correlation coefficients, although these are inappropriate for autocorrelated data), or surrogates generated using the Fourier (method flag containing "fft") or amplitude adjusted Fourier surrogates ("aaft"). For "coh" and "ReXWT", the fast testing algorithm of Sheppard et al. (2017) is also implemented ("fast"). That method uses implicit Fourier surrogates. The choice of wavelet coherence (method flag containing "coh") or the real part of the cross-wavelet transform (method flag containing "ReXWT") depends mainly on treatment of out-of-phase relationships. The "ReXWT" is more akin to a correlation coefficient in that strong in-phase relationships approach 1 and strong antiphase relationships approach -1. Wavelet coherence allows any phase relationship and ranges from 0 to 1. Power normalization is applied for "coh" and for "ReXWT". All significance tests are one-tailed. Synchrony matrices for significance-based methods when weighted is TRUE contain 1 minus the p-values.

Clustering is performed using the the eigenvector-based modularity method of Newman (2006).

Value

clust returns an object of class clust. Slots are:

dat	The input
times	The input
coords	The input
methodspecs	A list with elements specifying the method used, and methodological parameters that were in the input.
adj	The adjacency matrix that defines the synchrony network
clusters	A list with one element for each successive split of the networks into subcomponents carried out by the clustering algorithm. Each element is a vector of length equal to the number of nodes in the original network, giving cluster membership of the nodes. The first element is a vector of all 1s, corresponding to before the first clustering split was performed.

modres	A list of the same length as clusters, with each element containing the results of calling modularity on the network split to that level.
mns	Mean time series for modules. A list of the same length as clusters.
wmfs	Wavelet mean fields for modules. NA when clust is first called, but addwmfs causes this entry to be added. It is a list. See documentation for the method addwmfs.
wpmfs	Wavelet phasor mean fields for modules. NA when clust is first called, but addwpmfs causes this entry to be added. It is a list. See documentation for the method addwpmfs.

## S3 method for class 'clust'
get_methodspec(obj)

## S3 method for class 'clust'
get_wmfs(obj)

## S3 method for class 'clust'
get_wpmfs(obj)
```

Arguments

`object, x, obj`	An object of class `clust`
`...`	Not currently used. Included for argument consistency with existing generics.
`newval`	A new value, for the `set_*` methods

Value

`summary.clust` produces a summary of a `clust` object. A `print.clust` method is also available. For `clust` objects, `set_*` and `get_*` methods are available for all slots (see the documentation for `clust` for a list). The `set_*` methods just throw an error, to prevent breaking the consistency between the slots of a `clust` object.

coh *Coherence*

Description

Wavelet coherence and wavelet phase coherence, spatial or for single time series. Also the generator function for the coh class, which inherits from the `list` class.

Usage

```
coh(dat1, dat2, times, norm, sigmethod = "none", nrand = 1000,
  scale.min = 2, scale.max.input = NULL, sigma = 1.05, f0 = 1)
```

Arguments

`dat1`	A locations (rows) x time (columns) matrix (for spatial coherence), or a single time series
`dat2`	Same format as dat1, same locations and times
`times`	The times at which measurements were made, spacing 1
`norm`	The normalization of wavelet transforms to use. Controls the version of the coherence that is performed. One of "none", "phase", "powall", "powind". See details.
`sigmethod`	The method for significance testing. One of "none", "fftsurrog1", "fftsurrog2", "fftsurrog12", "aaftsurrog1", "aaftsurrog2", "aaftsurrog12", "fast". See details.
`nrand`	Number of surrogate randomizations to use for significance testing.
`scale.min`	The smallest scale of fluctuation that will be examined. At least 2.
`scale.max.input`	The largest scale of fluctuation guaranteed to be examined

sigma	The ratio of each time scale examined relative to the next timescale. Should be greater than 1.
f0	The ratio of the period of fluctuation to the width of the envelope

Details

If the dimensions of dat1 and dat2 are N by T (N is 1 for vector dat1 and dat2), and if the wavelet transform of the nth row of dati is denoted $W_{i,n,\sigma}(t)$, then the coherence is the average, over all locations n and times t for which wavelet transforms are available, of the quantity $w_{1,n,\sigma}(t)w_{2,n,\sigma}(t)^*$, where the $*$ represents complex conjugation and $w_{i,n,\sigma}(t)$ is a normalization of the wavelet transform. The normalization used depends on norm. If norm is "none" then raw wavelet transforms are used. If norm is "phase" then $w_{i,n,\sigma}(t) = W_{i,n,\sigma}(t)/|W_{i,n,\sigma}(t)|$, which gives the wavelet phase coherence, or the spatial wavelet phase coherence if $N > 1$. If norm is "powall" then the normalization is that descibed in the "Wavelet mean field" section of the Methods of Sheppard et al. (2016), giving the version of the coherence that was there called simply the wavelet coherence, or the spatial wavelet coherence if $N > 1$. If norm is "powind", then $w_{i,n,\sigma}(t)$ is obtained by dividing $W_{i,n,\sigma}(t)$ by the square root of the average of $W_{i,n,\sigma}(t)W_{i,n,\sigma}(t)^*$ over the times for which it is defined; this is done separately for each i and n.

The slot signif is NA if sigmethod is "none". Otherwise, and if sigmethod is not "fast", then signif$coher is the same as coher, and signif$scoher is a matrix of dimensions nrand by length(coher) with rows with magnitudes equal to coherences of surrogate datasets, computed using the normalization specified by norm. The type of surrogate used (Fourier surrogates or amplitude adjusted Fourier surrogates, see surrog), as well as which of the datasets surrogates are computed on (dat1, dat2, or both) is determined by sigmethod. The first part of the value of sigmethod specifies the type of surrogate used, and the numbers in the second part (1, 2, or 12) specify whether surrogates are applied to dat1, dat2, or both, respectively. Synchrony-preserving surrogates are used. A variety of statements of significance (or lack thereof) can be made by comparing signif$coher with signif$scoher (see the plotmag, plotrank, and bandtest methods for the coh class). If sigmethod is "fast", the fast algorithm of Sheppard et al. (2017) is used. In that case signif$coher can be compared to signif$scoher to make significance statements about the coherence in exactly the same way, but signif$coher will no longer precisely equal coher, and coher should not be compared directly to signif$scoher. Statements about significance of the coherence should be made using signif$coher and signif$scoher, whereas coher should be used whenever the actual value of the coherence is needed. No fast algorithm exists for norm equal to "phase" (the phase coherence; Sheppard et al, 2017), so if norm is "phase" and sigmethod is "fast", the function throws an error.

The slots ranks and bandp are empty on an initial call to coh. They are made to compute and hold aggregate significance results over any timescale band of choice. These are filled in when needed by other methods, see plotrank and bandtest.

Regardless of what the variables represent, the normalized transform of dat1 is multiplied by the conjugate of the normalized transform of dat2. Thus, a positive phase of the coherence indicates dat1 would be leading dat2.

Value

coh returns an object of class coh. Slots are:

dat1, dat2	The input data

times	The times associated with the data
sigmethod	The method for significance testing, as inputted.
norm	The normalization of the wavelet transforms that will be used in computing the coherence. Different values result in different versions of the coherence. One of "none", "phase", "powall", "powind". See details.
wtopt	The inputted wavelet transform options scale.min, scale.max.input, sigma, f0 in a list
timescales	The timescales associated with the coherence
coher	The complex magnitude of this quantity is the coherence, calculated in the usual way (which depends on norm, see details), and with scalloping of the transforms.
signif	A list with information from the significance testing. Elements are coher and scoher. See details.
ranks	A list with ranking information for signif. NA until plotrank is called, see documentation for plotrank.
bandp	A data frame containing results of computing significances of the coherence across timescale bands. Empty on an initial call to coh, filled in by the function bandtest. See details.

coh_methods *Basic methods for the* coh *class*

Description

Set, get, summary, and print methods for the coh class.

Usage

```
## S3 method for class 'coh'
summary(object, ...)

## S3 method for class 'coh'
print(x, ...)

## S3 method for class 'coh'
set_times(obj, newval)

## S3 method for class 'coh'
set_timescales(obj, newval)

## S3 method for class 'coh'
set_coher(obj, newval)

## S3 method for class 'coh'
set_dat1(obj, newval)

## S3 method for class 'coh'
set_dat2(obj, newval)

## S3 method for class 'coh'
set_wtopt(obj, newval)

## S3 method for class 'coh'
set_norm(obj, newval)

## S3 method for class 'coh'
set_sigmethod(obj, newval)

## S3 method for class 'coh'
set_signif(obj, newval)

## S3 method for class 'coh'
set_ranks(obj, newval)

## S3 method for class 'coh'
set_bandp(obj, newval)
```

```
## S3 method for class 'coh'
get_times(obj)

## S3 method for class 'coh'
get_timescales(obj)

## S3 method for class 'coh'
get_norm(obj)

## S3 method for class 'coh'
get_sigmethod(obj)

## S3 method for class 'coh'
get_signif(obj)

## S3 method for class 'coh'
get_ranks(obj)

## S3 method for class 'coh'
get_bandp(obj)
```

Arguments

object, x, obj	An object of class coh
...	Not currently used. Included for argument consistency with existing generics.
newval	A new value, for the set_* methods

Value

summary.coh produces a summary of a coh object. A print.coh method is also available. For coh objects, set_* and get_* methods are available for all slots (see the documentation for coh for a list). The set_* methods just throw an error, to prevent breaking the consistency between the slots of a coh object.

errcheck_stdat *Error check for appropriate spatio-temporal data*

Description

Error checking whether a times vector and a matrix with each row a time series make a legitimate spatio-temporal data set for wavelet analysis

Usage

```
errcheck_stdat(times, dat, callfunc)
```

Arguments

times	the times of measurement, spacing 1
dat	each row is a time series - must have at least two rows
callfunc	the function calling this one, for error tracking

Value

errcheck_stdat returns nothing but throws and error if inputs not appropriate

Author(s)

Daniel Reuman, <reuman@ku.edu>

errcheck_times *Error check* times

Description

Error check whether a vector can represent times at which data suitable for wavelet transforms were measured

Usage

```
errcheck_times(times, callfunc)
```

Arguments

times	Tests whether this is a numeric vector with unit-spaced increasing values
callfunc	Function calling this one, for better error messaging

Value

errcheck_times returns nothing but throws and error if the conditions are not met

Author(s)

Daniel Reuman, <reuman@ku.edu>

errcheck_tsdat *Error check for appropriate temporal data*

Description

Error checking whether a times vector and t.series vector make a legitimate time series for wavelet analysis

Usage

```
errcheck_tsdat(times, t.series, callfunc)
```

Arguments

times	times of measurement, spacing 1
t.series	the measurements
callfunc	the function from which this one was called, for error tracking

Value

errcheck_tsdat returns nothing but throws and error if inputs not appropriate

Author(s)

Daniel Reuman, <reuman@ku.edu>

`errcheck_tts` *Error check whether inputs are suitable for a tts object*

Description

Error check whether inputs are suitable for a tts object

Usage

```
errcheck_tts(times, timescales, values, callfunc)
```

Arguments

`times`	times of measurement, spacing 1
`timescales`	timescales of analysis
`values`	a times by timescales matrix
`callfunc`	the function from which this one was called, for error tracking

Value

`errcheck_tts` returns nothing but throws and error if inputs not appropriate

Author(s)

Daniel Reuman, <reuman@ku.edu>

`errcheck_wavparam` *Error check wavelet transform parameters*

Description

Error check the parameters `scale.min`, `scale.max.input`, `sigma`, `f0`

Usage

```
errcheck_wavparam(scale.min, scale.max.input, sigma, f0, times, callfunc)
```

Arguments

scale.min	The smallest scale of fluctuation that will be examined. At least 2.
scale.max.input	The largest scale of fluctuation that is guaranteed to be examined
sigma	The ratio of each time scale examined relative to the next timescale. Should be greater than 1.
f0	The ratio of the period of fluctuation to the width of the envelope. Defaults to 1.
times	The times data were measured at, spacing 1
callfunc	Function calling this one, for better error messaging

Value

errcheck_wavparam returns nothing but throws and error if the conditions are not met

Author(s)

Daniel Reuman, <reuman@ku.edu>

---

fastcohtest *Fast algorithm for significance testing coherence using Fourier surrogates*

Description

This is the algorithm of Sheppard et al. (2017) (see references).

Usage

```
fastcohtest(dat1, dat2, scale.min, scale.max.input, sigma, f0, nrand, randnums,
  randbits, norm)
```

Arguments

dat1	A locations (rows) x time (columns) matrix (for spatial coherence), or a single time series
dat2	Same format as dat1, same locations and times
scale.min	The smallest scale of fluctuation that will be examined. At least 2.
scale.max.input	The largest scale of fluctuation guaranteed to be examined
sigma	The ratio of each time scale examined relative to the next timescale. Should be greater than 1.
f0	The ratio of the period of fluctuation to the width of the envelope
nrand	Number of surrogate randomizations to use for significance testing

randnums	A bunch of independent random numbers uniformly distributed on (0,1). There must be nrand*floor((dim(dat1)[2]-1)/2) of these.
randbits	A bunch of random bits (0 or 1). There must be nrand of these if time series are of odd length and 2*nrand if even length. You may pass more than this, so, in particular, you may pass 2*nrand for even or odd length.
norm	The normalization of wavelet transforms to use. Controls the version of the coherence that is performed. One of "none", "powall", "powind". See details in the documentation of coh.

Value

fastcohtest returns a list with these elements:

timescales	The timescales used
coher	The magnitude of this is the fast-algorithm version of the coherence between the two datasets, for comparison with scoher
scoher	A matrix with nrand rows, the magnitude of each one is the fast-algorithm version of the coherence for a surrogate

Note

Internal function, minimal error checking.

fftsurrog *Surrogate time series using Fourier surrogates*

Description

Creates surrogate time series using Fourier surrogates

Usage

```
fftsurrog(dat, nsurrogs, syncpres)
```

Arguments

dat	A locations x time matrix of observations
nsurrogs	The number of surrogates to produce
syncpres	Logical. TRUE for "synchrony preserving" surrogates (same phase randomizations used for all time series). FALSE leads to independent phase randomizations for all time series.

Value

fftsurrog returns a list of nsurrogs surrogate datasets

Note

For internal use, no error checking

---

is.connected *Tests if a graph is connected*

Description

Tests if a graph represented by an adjacency matrix is connected.

Usage

```
is.connected(adj)
```

Arguments

adj	An adjacency matrix. Must be a numeric matrix with non-negative entries.

Details

Idea by Ed Scheinerman, circa 2006. Source: http://www.ams.jhu.edu/~ers/matgraph/; routine: matgraph/@graph/isconnected.m

Value

`is.connected` returns `TRUE` or `FALSE` depending on whether the graph represented in `adj` is a connected graph.

Author(s)

Lei Zhao, <lei.zhao@cau.edu.cn>

See Also

`cluseigen`, `clust`, `browseVignettes("wsyn")`

Examples

```
g1<-matrix(c(0,0,0,1,1,0,0,0,0,1,0,0,0,0,1,0),4,4)
is.connected(g1)
g2<-matrix(c(0,1,0,0,1,0,0,0,0,0,0,1,0,0,1,0),4,4)
is.connected(g2)
```

---

makeunweighted *For converting certain synchrony matrices to unweighted versions*

Description

Convenience function for converting certain synchrony matrices to unweighted versions

Usage

```
makeunweighted(mat, sigthresh)
```

Arguments

`mat`	A synchrony matrix based on significance testing
`sigthresh`	Significance threshold to use

Value

`makeunweighted` converts to an unweighted version of the input. Entries of `mat` less than `sigthresh` become a 1, other entries become a 0. The diagonal is `NA`.

Note

Internal function, no error checking

Author(s)

Lei Zhao, <lei.zhao@cau.edu.cn>, Daniel Reuman <reuman@ku.edu>

mnphase *Mean phase of coherence*

Description

Gets the mean phase of a bunch of complex numbers

Usage

```
mnphase(nums)
```

Arguments

nums	A vector of complex numbers

Value

mnphase returns the mean phase

Note

Internal funcion, no error catching

Author(s)

Daniel Reuman, <reuman@ku.edu>

modularity *Modularity of a community structure of a graph*

Description

Computes the modularity of partitioning of a graph into sub-graphs. Similar to the modularity function in the igraph package, but allows negative edge weights.

Usage

```
modularity(adj, membership, decomp = FALSE)
```

Arguments

adj	An adjacency matrix, which should be symmetric with zeros on the diagonal.
membership	Vector of length equal to the number of graph nodes (columns/rows of adj) indicating the cluster/sub-graph each nodes belongs to.
decomp	Logical. If TRUE, calculate the decomposition of modularity by modules and nodes. Default FALSE.

Details

The difference between this function and the function `modularity` in the package `igraph` is that this function can be used with an adjacency matrix with negative elements. This is a common case for matrices arrising from a for correlation matrix or another synchrony matrix. If the matrix is non-negative, the result of this function should be exactly the same as the result from `modularity` in the `igraph` package.

Value

`modularity` returns a list containing the following:

`totQ`	The total modularity. This is the only output if `decomp=FALSE`
`modQ`	The contribution of each module to the total modularity
`nodeQ`	The contribution of each node to the total modularity

Note

Adapted from code developed by Robert J. Fletcher, Jr.

Examples

```
adj<-matrix(0, 10, 10) # create a fake adjacency matrix
adj[lower.tri(adj)]<-runif(10*9/2, -1, 1)
adj<-adj+t(adj)
colnames(adj)<-letters[1:10]
m<-cluseigen(adj)
z<-modularity(adj, m[[length(m)]], decomp=TRUE)
```

normforcoh *Normalization for the* coh *function*

Description

A convenience function for performing the normalization step for the coh function.

Usage

```
normforcoh(W, norm)
```

Arguments

W	An array of wavelet transforms, locations by times by timescales
norm	The normalization of wavelet transforms to use. Controls the version of the coherence that is performed. One of "none", "phase", "powall", "powind". See details section of the documentation for coh.

Value

normforcoh returns an array the same dimensions as W of normalized transforms

Note

Internal function, no error checking

Author(s)

Daniel Reuman, <reuman@ku.edu>

plotmag *For plotting the magnitude of values in* tts*,* coh *and* wlmtest *objects*

Description

For plotting the magnitude of values in tts objects (and derived classes) against time and timescale, and coh and wlmtest objects against timescale

Usage

```
plotmag(object, ...)

## S3 method for class 'tts'
plotmag(object, zlims = NULL, neat = TRUE, colorfill = NULL,
  colorbar = TRUE, title = NULL, filename = NA, ...)

## S3 method for class 'wt'
plotmag(object, zlims = NULL, neat = TRUE, colorfill = NULL,
  colorbar = TRUE, title = NULL, filename = NA, ...)

## S3 method for class 'wmf'
plotmag(object, zlims = NULL, neat = TRUE, colorfill = NULL,
  colorbar = TRUE, title = NULL, filename = NA, ...)

## S3 method for class 'wpmf'
plotmag(object, zlims = NULL, neat = TRUE,
  colorfill = NULL, sigthresh = 0.95, colorbar = TRUE, title = NULL,
  filename = NA, ...)

## S3 method for class 'coh'
plotmag(object, sigthresh = c(0.95, 0.99), bandprows = "all",
  filename = NA, ...)

## S3 method for class 'wlmtest'
plotmag(object, sigthresh = c(0.95, 0.99),
  bandprows = "all", filename = NA, ...)

## Default S3 method:
plotmag(object, ...)
```

Arguments

object	An object of class tts or some class that inherits from tts or of class coh or wlmtest
...	Additional graphics parameters passed to image (graphics package) if colorbar==FALSE, or to image.plot (fields package) if colorbar==TRUE (for tts objects)
zlims	z axis limits. If specified, must encompass the range of Mod(get_values(object)). Default NULL uses this range.
neat	Logical. Should timescales with no values be trimmed?
colorfill	Color spectrum to use, set through colorRampPalette. Default value NULL produces jet colors from Matlab.
colorbar	Logical. Should a colorbar legend be plotted?
title	Title for the top of the plot.
filename	Filename (without extension), for saving as pdf. Default value NA saves no file and uses the default graphics device.

sigthresh	Significance threshold(s). Numeric vector with values between 0 and 1. Typically 0.95, 0.99, 0.999, etc. For wpmf objects, contours are plotted at these values; for coh and wlmtest objects the threshholds are plotted on coherence plots.
bandprows	The rows of object$bandp for which to display results in coh plots

Details

For coh (respectively, wlmtest) objects, the modulus of object$coher (respectively, object$wlmobj$coher) is plotted using a solid red line, and the modulus of object$signif$coher is plotted using a dashed red line. The two coherences agree except for sigmethod="fast", for which they are close. The dashed line is what should be compared to the distribution of surrogate coherences (black lines, which only appear for coh objects if signif is not NA). Horizontal axis ticks are labeled as timescales, but are spaced on the axis as log(1/timescale), i.e., log frequencies.

`plotmap` *Map clusters from a* `clust` *object*

Description

Produces a map of the locations of sampling for a `clust` object, with colors indicating module (cluster) identity. The sizes of nodes (locations) are scaled according to the strength of membership in its module.

Usage

```
plotmap(inclust, spltlvl = length(inclust$clusters), nodesize = c(1, 3),
  filename = NA)
```

Arguments

`inclust`	A `clust` object, as created with `wsyn::clust`
`spltlvl`	The split level in the clustering to use. This is the index of inclust$clusters. Default the final split.
`nodesize`	A length = 2 vector giving the minimum and maximum node size for plotting. Defaults to c(1,3).
`filename`	a filename, possibly including path info, but without a file extension. If present, exports the plot as a .pdf using the specified filename. Default `NA` uses the default plotting device.

Value

plotmap produces a map.

plotphase *For plotting the phases of values in* tts *and* coh *objects*

Description

For plotting the phases of values in tts objects (and derived classes) against time and timescale, and coh objects against timescale

Usage

```
plotphase(object, ...)

## S3 method for class 'tts'
plotphase(object, filename = NA, ...)

## S3 method for class 'wt'
plotphase(object, filename = NA, ...)

## S3 method for class 'wmf'
plotphase(object, filename = NA, ...)

## S3 method for class 'wpmf'
plotphase(object, filename = NA, ...)

## S3 method for class 'coh'
plotphase(object, bandprows = "all", filename = NA, ...)

## Default S3 method:
plotphase(object, ...)
```

Arguments

object	A coh object.
...	Passed from the generic to specific methods. The plotphase.tss method passes it to fields::image.plot.
filename	Filename (without extension), for saving as pdf. Default value NA saves no file and uses the default graphics device.
bandprows	The rows of object$bandp for which to display p-value results in the plot

plotphase(res)
```

`plotrank` *Plots* `ranks` *slot for* `coh` *and* `wlmtest` *objects*

Description

Plots the `ranks` slot for `coh` and `wlmtest` objects to help identify statistical significance of coherence

Usage

```
plotrank(object, ...)

## S3 method for class 'coh'
plotrank(object, sigthresh = 0.95, bandprows = "all",
  filename = NA, ...)
```

```
## S3 method for class 'wlmtest'
plotrank(object, sigthresh = 0.95, bandprows = "all",
  filename = NA, ...)

## Default S3 method:
plotrank(object, ...)
```

Arguments

object	A coh or wlmtest object. Must have a non-NA signif slot.
...	Passed from the generic to specific methods. Not currently used.
sigthresh	Significance threshold(s). Numeric vector with values between 0 and 1. Typically 0.95, 0.99, 0.999, etc. The threshhold(s) are plotted on the rank plot as dashed horizontal line(s).
bandprows	The rows of object$bandp for which to display p-value results in the plot
filename	Filename (without extension), for saving as pdf. Default value NA saves no file and uses the default graphics device.

Details

The plot shows the modulus of object$ranks$coher versus log(1/object$timescales). Horizontal axis ticks are labeled as timescales, but are spaced on the axis as log(1/timescale), i.e., log frequencies. p-values from object$bandp are displayed above the rank plot.

power *Power of a* tts *object*

Description

Returns the power of a tts object, i.e., the mean over time of the squared magnitude (which is a function of timescale)

Usage

```
power(object)

## S3 method for class 'tts'
power(object)
```

Arguments

object	A tts object

Value

power returns a data frame with columns timescales and power

Author(s)

Daniel Reuman, <reuman@ku.edu>

res<-power(ttsobj)
```

---

predsync *Predicted synchrony of a wavelet linear model*

Description

Predicted synchrony of a wlm object. This is described in the first paragraph of Appendix S15 of Sheppard et al (2019).

Usage

```
predsync(wlmobj)

## S3 method for class 'wlm'
predsync(wlmobj)
```

Arguments

wlmobj	A wlm object

Value

predsync returns a tts object. Plotting the magnitude (see plotmag) displays a picture of predicted synchrony versus time and timescale that is comparable with the wavelet mean field (see wmf) of the response variable of the model. Calling the power function on that tts object should give the same results as one of the columns of output of syncexpl. Only norm="powall" implemented so far.

print.summary_wsyn *Print method for* summary_wsyn *class*

Description

Print method for summary_wsyn class

Usage

```
## S3 method for class 'summary_wsyn'
print(x, ...)
```

Arguments

x	A summary_wsyn object
...	Not currently used. Included for argument consistency with existing generics.

Value

print.summary_wsyn is called for its effect of printing to the screen.

---

setmints *Shifts a vector according to the argument mints*

Description

Shifts a vector according to the argument mints

Usage

```
setmints(ts, mints)
```

Arguments

ts	A vector of numeric values representing a time series
mints	The time series is shifted to have this minimum value. Default NA means use the smallest difference between consecutive, distinct sorted values of the time series. NaN means perform no shift.

Value

`setmints` returns the shifted vector.

Daniel Reuman, <reuman@ku.edu>

Note

This is an internal function, and no error checking is done.

`set_adj` *Set and get methods for classes in the* `wsyn` *package*

Description

Set and get methods for classes in the `wsyn` package. There are methods for each slot of each class, named `set_*` and `get_*` for `*` the slot name. Below are listed function specs for the generics and the default methods.

Usage

```
set_adj(obj, newval)

## Default S3 method:
set_adj(obj, newval)

set_clusters(obj, newval)

## Default S3 method:
set_clusters(obj, newval)

set_modres(obj, newval)

## Default S3 method:
set_modres(obj, newval)

set_mns(obj, newval)

## Default S3 method:
set_mns(obj, newval)

set_coords(obj, newval)

## Default S3 method:
set_coords(obj, newval)

set_methodspecs(obj, newval)
```

```
## Default S3 method:
set_methodspecs(obj, newval)

set_wmfs(obj, newval)

## Default S3 method:

## Default S3 method:
set_coefs(obj, newval)

set_modval(obj, newval)

## Default S3 method:
set_modval(obj, newval)

set_wts(obj, newval)

## Default S3 method:
set_wts(obj, newval)

get_coefs(obj)

## Default S3 method:
get_coefs(obj)

get_modval(obj)

## Default S3 method:
get_modval(obj)

get_wts(obj)

## Default S3 method:
get_wts(obj)

set_wlmobj(obj, newval)

## Default S3 method:
set_wlmobj(obj, newval)

set_drop(obj, newval)

## Default S3 method:
set_drop(obj, newval)
```

```
get_wlmobj(obj)

## Default S3 method:
get_wlmobj(obj)

get_drop(obj)

## Default S3 method:
get_drop(obj)

set_signif(obj, newval)

## Default S3 method:
set_signif(obj, newval)

get_signif(obj)

## Default S3 method:
get_signif(obj)

set_dat(obj, newval)

## Default S3 method:
set_dat(obj, newval)

set_wtopt(obj, newval)

## Default S3 method:
set_wtopt(obj, newval)

get_dat(obj)

## Default S3 method:
get_dat(obj)

get_wtopt(obj)

## Default S3 method:
get_wtopt(obj)
```

Arguments

obj	An object of one of the classes defined in the package
newval	A newvalue of the slot in question, for the set_* methods

Details

There are methods for the tts, wt, wmf, wpmf, coh, wlm, wlmtest, and clust classes. See documentation for the generator functions for these classes (which in all cases have the same name as the class) for lists of slots for each class.

Value

set_* methods throw an error - setting of individual slots is not allowed, as it breaks consistency with the other slots. get_* just returns the value in question.

Author(s)

Daniel Reuman, <reuman@ku.edu>

Examples

```
times<-1:10
timescales<-1/c(1:10)
values<-matrix(1,length(times),length(timescales))
h<-tts(times,timescales,values)
get_times(h)
```

---

surrog *Creates surrogate time series, either Fourier surrogates or amplitude adjusted Fourier surrogates*

Description

For significance testing wavelet coherence and other purposes

Usage

```
surrog(dat, nsurrogs, surrtype, syncpres)
```

Arguments

dat	A locations x time matrix of observations (for multiple-time series input), or a single vector
nsurrogs	The number of surrogates to produce
surrtype	Either "fft" (for Fourier surrogates) or "aaft" (for amplitude adjusted Fourier surrogates). Fourier surrogates are appropriate for time series with normal marginals; otherwise consider aaft surrogates.
syncpres	Logical. TRUE for "synchrony preserving" surrogates (same phase randomizations used for all time series). FALSE leads to independent phase randomizations for all time series.

Details

Fourier surrogates are somewhat faster than `aaft` surrogates, and may be much faster when some of the time series in the data have ties. Prenormalization (e.g., using `cleandat`) can make it possible to use `fft` surrogates.

Value

`surrog` returns a list of nsurrogs surrogate datasets

Author(s)

Jonathan Walter, <jaw3es@virginia.edu>; Lawrence Sheppard, <lwsheppard@ku.edu>; Daniel Reuman, <reuman@ku.edu>

res<-surrog(dat,nsurrogs,surrtype,syncpres)
```

---

syncexpl *Amount of synchrony explained, and related quantities*

Description

Gives amount of synchrony explained by a wavelet linear model, as a function of timescale, and related quantities (see details)

Usage

```
syncexpl(object)

## S3 method for class 'wlm'
syncexpl(object)
```

Arguments

object	A wlm object

Details

This function only works for norm="powall" at present. See Sheppard et al (2018) for details of the meaning and computation of the columns.

Value

syncexpl returns a data frame with columns for timescales, sync (the time-averaged square magnitude of the wavelet mean field of the response transforms), syncexpl (synchrony explained by the model predictors), columns named for each predictor (synchrony explained by that predictor), interactions (synchrony explained by all interaction effects), columns named for each pair of predictors (synchrony explained by individual pairwise interactions). There are also columns for crossterms and resids (residuals). The cross terms must be small for a given timescale band for the other results to be meaningful. All columns are functions of timescales.

synmat *Synchrony matrices*

Description

Calculate synchrony matrices using a variety of methods

Usage

```
synmat(dat, times, method, tsrange = c(0, Inf), nsurrogs = 1000,
  scale.min = 2, scale.max.input = NULL, sigma = 1.05, f0 = 1,
  weighted = TRUE, sigthresh = 0.95)
```

Arguments

dat	A locations (rows) x time (columns) matrix of measurements
times	The times at which measurements were made, spacing 1
method	Method for synchrony calculation. See details.
tsrange	A vector containing the min and max of the focal timescale range. Defaults to all timescales that are valid given choices for scale.min, scale.max.input, f0, sigma. Only used for wavelet-based methods.
nsurrogs	Number of surrogates for significance test. Defaults to 1000. Only used for surrogate-based methods.

scale.min	The smallest scale of fluctuation that will be examined. At least 2. Used only for wavelet-based methods.
scale.max.input	The largest scale of fluctuation guaranteed to be examined. Only used for wavelet-based methods.
sigma	The ratio of each time scale examined relative to the next timescale. Should be greater than 1. Only used for wavelet-based methods.
f0	The ratio of the period of fluctuation to the width of the envelope. Only used for wavelet-based methods.
weighted	If TRUE, create a weighted network. If FALSE, create a binary network using statistical significance. Binary networks are only allowed for networks based on significance.
sigthresh	Significance threshold needed, if weighted is false, for a network link to be realized. Typically 0.95, 0.99, or 0.999, etc. Only used if weighted is FALSE.

Details

The following values are valid for method: "pearson", "pearson.sig.std", "pearson.sig.fft", "pearson.sig.aaft", "spearman", "spearman.sig.std", "spearman.sig.fft", "spearman.sig.aaft", "kendall", "kendall.sig.std", "kendall.sig.fft", "kendall.sig.aaft", "ReXWT", "ReXWT.sig.fft", "ReXWT.sig.aaft", "ReXWT.sig.fast", "coh", "coh.sig.fft", "coh.sig.aaft", "coh.sig.fast", "phasecoh", "phasecoh.sig.fft", and "phasecoh.sig.aaft". The first portions of these identifiers correspond to the Pearson, Spearman, and Kendall correlations, the real part of the cross-wavelet transform, the wavelet coherence, and the wavelet phase coherence. The second portions of these identifiers, when present, indicates that significance of the measure specified in the first portion of the identifies is to be used for establishing the synchrony matrix. Otherwise the value itself is used. The third part of the method identifier indicates what type of significance is used.

Significance testing is performed using standard approaches (method flag containg std; for correlation coefficients, although these are inappropriate for autocorrelated data), or surrogates generated using the Fourier (method flag containing "fft") or amplitude adjusted Fourier surrogates ("aaft"). For "coh" and "ReXWT", the fast testing algorithm of Sheppard et al. (2017) is also implemented ("fast"). That method uses implicit Fourier surrogates. The choice of wavelet coherence (method flag containing "coh") or the real part of the cross-wavelet transform (method flag containing "ReXWT") depends mainly on treatment of out-of-phase relationships. The "ReXWT" is more akin to a correlation coefficient in that strong in-phase relationships approach 1 and strong antiphase relationships approach -1. Wavelet coherence allows any phase relationship and ranges from 0 to 1. Power normalization is applied for "coh" and for "ReXWT". All significance tests are one-tailed. Synchrony matrices for significance-based methods when weighted is TRUE contain 1 minus the p-values.

Value

synmat returns a synchrony matrix, of type depending on the method argument. See details. Diagonal entries are left as NA.

tts *Creator function for the* tts *class*

Description

The tts (time/timescale) class is for matrices for which the rows correspond to times and the columns correspond to timescales. This is a general class from which other classes inherit (e.g., wt, wmf, wpmf). tts inherits from the list class.

Usage

```
tts(times, timescales, values)
```

Arguments

times	A numeric vector of increasing real values, spacing 1
timescales	A numeric vector with positive entries
values	A complex or numeric matrix of dimensions length(times) by length(timescales)

Value

tts returns an object of class tts. Slots are:

times	a numeric vector of evenly spaced times
timescales	a numeric vector of positive timescales
values	a complex or numeric matrix of dimensions length(times) by length(timescales)

Author(s)

Daniel Reuman, <reuman@ku.edu>

See Also

tts_methods, wt, wmf, wpmf, browseVignettes("wsyn")

Examples

```
times<-1:10
timescales<-1/c(1:10)
values<-matrix(1,length(times),length(timescales))
h<-tts(times,timescales,values)
```

---

tts_methods *Basic methods for the* tts *class*

Description

Set, get, summary, and print methods for the tts class.

Usage

```
## S3 method for class 'tts'
summary(object, ...)

## S3 method for class 'tts'
print(x, ...)

## S3 method for class 'tts'
set_times(obj, newval)

## S3 method for class 'tts'
set_timescales(obj, newval)

## S3 method for class 'tts'
set_values(obj, newval)

## S3 method for class 'tts'
get_times(obj)

## S3 method for class 'tts'
get_timescales(obj)

## S3 method for class 'tts'
get_values(obj)
```

Arguments

object, x, obj	An object of class tts
...	Not currently used. Included for argument consistency with existing generics.
newval	A new value, for the set_* methods

Value

summary.tts produces a summary of a tts object. A print.tts method is also available. For tts objects, set_* and get_* methods are available for all slots, i.e., * equal to times, timescales, and values. The set_* methods just throw an error. Although class tts is flexible enough that setting of individual slots could have been allowed, because wt and other classes are based on it and because individual slots of those classes should not be changed, for consistency the same is forced for the tts class.

warray *Creates an array of wavelet transforms from input timeseries*

Description

Creates an array of wavelet transforms from input timeseries

Usage

```
warray(dat, times, scale.min = 2, scale.max.input = NULL, sigma = 1.05,
  f0 = 1)
```

Arguments

dat	A locations (rows) x time (columns) matrix
times	A vector of timestep values (e.g. years), spacing 1
scale.min	The smallest scale of fluctuation that will be examined. At least 2.
scale.max.input	The largest scale of fluctuation that will be examined. Note that if this is set too high relative to the length of the timeseries it will be truncated.
sigma	The ratio of each time scale examined relative to the next timescale. Greater than 1.
f0	The ratio of the period of fluctuation to the width of the envelope

Value

warray returns a list containing:

wavarray	locations x time x timescales array of wavelet transforms
times	the time steps specified (e.g., years)
timescales	the timescales (1/frequency) computed for the wavelet transforms

Note

Important for interpreting the phase: the phases grow through time, i.e., they turn anti-clockwise. This function is internal, no error checking.

---

wavmatwork — *Facilitates the computations in synmat for coherence and ReXWT methods*

Description

Worker/utility function serving the analysis carried out in synmat for methods based on coherence or real part of the cross-wavelet transform.

Usage

```
wavmatwork(dat, times, scale.min, scale.max.input, sigma, f0, norm, treatment)
```

Arguments

dat	A locations (rows) x time (columns) matrix of measurements
times	The times at which measurements were made, spacing 1
scale.min	The smallest scale of fluctuation that will be examined. At least 2. Used only for wavelet-based methods.
scale.max.input	The largest scale of fluctuation guaranteed to be examined. Only used for wavelet-based methods.
sigma	The ratio of each time scale examined relative to the next timescale. Should be greater than 1. Only used for wavelet-based methods.
f0	The ratio of the period of fluctuation to the width of the envelope. Only used for wavelet-based methods.
norm	The normalization of wavelet transforms to be used. One of "none", "phase", "powind".
treatment	Either "Mod" or "Re"

Value

wavmatwork returns a list consisting of:

timescales	The timescales of analysis
wavarray	An array, locations by locations by timescales, containing either the coherences (for treatment="Mod") or the real parts of the cross-wavelet transforms (for treatment="Re") between locations.

Note

Internal function, no error checking done.

wlm *Wavelet linear models*

Description

Fits wavelet linear models. Also the generator function of the wlm class, which inherits from the list class.

Usage

```
wlm(dat, times, resp, pred, norm, scale.min = 2, scale.max.input = NULL,
  sigma = 1.05, f0 = 1)
```

Arguments

dat	A list of matrices representing the data (or in the case of one location, a list of vectors). All the same dimensions (respectively, lengths)
times	The times at which measurements were made, spacing 1
resp	Index in dat for the response variable of the model
pred	Vector of indices in dat for the predictor variables of the model; must differ from resp
norm	The normalization of wavelet transforms to use. One of "none", "powall", "powind". See details.
scale.min	The smallest scale of fluctuation that will be examined. At least 2.
scale.max.input	The largest scale of fluctuation that will be examined. Note that if this is set too high relative to the length of the timeseries it will be truncated.
sigma	The ratio of each time scale examined relative to the next timescale. Greater than 1.
f0	The ratio of the period of fluctuation to the width of the envelope

Details

Normalization is as specified in the documentation for coh, HOWEVER, only the "powall" option is currently implemented, other choices throw an error. Details are specified in appendices S7 and S9 of Sheppard et al, 2018. The output modval is v in appendix S7, and coefs are the betas in equation 12 in that appendix.

Value

wlm returns an object of class wlm. Slots are:

dat	The input data list, but reordered and subsetted so the response is first and only used predictors are included
times	The times associated with the data
norm	The input
wtopt	The inputted wavelet transform options scale.min, scale.max.input, sigma, f0 in a list
wts	List of transforms, normalized as specified in norm. Same length as the output dat, each entry a locations x time x timescales array of transforms.
timescales	The timescales associated with the wavelet transforms of the data
coefs	A list (data frame, actually) of complex vectors, each of length the same as timescales. These are the model coefficients (which depend on timescale), and correspond to the wts.
modval	The model values.
coher	Appropriately normalized version of coherence of the model and response transforms. See details.

res<-wlm(dat,times,resp,pred,norm)
```

---

wlmfit *Fits a wavelet linear model*

Description

Stripped down internal function for doing the fitting

Usage

```
wlmfit(wts, norm)
```

Arguments

wts	List of normalized transforms, normalized as specified in norm. Each entry a locations x time x timescales array of transforms. The first is the response variable, others are the predictors.
norm	The normalization that was used. One of "none", "powall", "powind". See details.

Details

Only norm="powall" works now, other options throw an error.

Value

wlmfit returns a list with these elements:

coefs	Model coefficients
modval	The right had side of the model
coher	Appropriately normalized coherence of the model and response variable

Note

Internal function, no error checking done.

---

wlmtest *Statistical comparison of wavelet linear models*

Description

Compares a wavelet linear model with a nested model. Also the generator function for the wlmtest class.

Usage

```
wlmtest(wlmobj, drop, sigmethod, nrand = 1000)
```

Arguments

wlmobj	A wlm object
drop	Either names or indices of variables in wlmobj$dat that are being dropped to form the simpler, nested model. The first variable in wlmobj$dat, which is the response, is not allowed here.
sigmethod	Method for significance testing. One of "fft", "aaft", "fast". See details.
nrand	The number of randomizations to do for significance

Details

The slot signif provides the core information on significance. If sigmethod is not "fast", then signif$coher is the same as wlmobj$coher, and signif$scoher is a matrix of dimensions nrand by length(signif$coher) with rows equal to coherences between refitted models and the response-variable transforms, for datasets where the variables specified in drop have been replaced by surrogates. Normalization as specified in norm is used. The type of surrogate used (Fourier surrogates or amplitude adjusted Fourier surrogates, see surrog) is determined by sigmethod ("fft" or "aaft"). Synchrony-preserving surrogates are used. A variety of statements of significance (or lack thereof) can be made by comparing signif$coher with signif$scoher (see the plotmag, plotrank, and bandtest methods for the wlmtest class). If sigmethod is "fast", a fast algorithm of Lawrence Sheppard is used which is a generalization to wavelet linear models of the fast algorithm for coherence described in Sheppard et al (2017). In that case signif$coher can be compared to signif$scoher to make significance statements about the coherence in exactly the same way, but signif$coher will no longer precisely equal wlmobj$coher, and wlmobj$coher should not be compared directly to signif$scoher. Statements about significance of the coherence should be made using signif$coher and signif$scoher, whereas wlmobj$coher should be used whenever the actual value of the coherence is needed.

The slots ranks and bandp are empty on an initial call to wlmtest. They are made to compute and hold aggregate significance results over any timescale band of choice. These are filled in when needed by other methods, see plotrank and bandtest.

Value

wlmtest returns an object of class wlmtest. Slots are:

wlmobj	The input
drop	The input
signif	A list with information from the significance testing. Elements are sigmethod (the input), coher and scoher. See details.
ranks	A list with ranking information for signif. NA until plotrank or bandtest is called.
bandp	A data frame containing results of computing significances across timescale bands. Empty on an initial call to wlmtest, filled in by the function bandtest. See details.

wlmtest_methods *Basic methods for the* wlmtest *class*

Description

Set, get, summary, and print methods for the wlmtest class.

Usage

```
## S3 method for class 'wlmtest'
summary(object, ...)

## S3 method for class 'wlmtest'
print(x, ...)

## S3 method for class 'wlmtest'
set_wlmobj(obj, newval)

## S3 method for class 'wlmtest'
set_drop(obj, newval)

## S3 method for class 'wlmtest'
set_signif(obj, newval)

## S3 method for class 'wlmtest'
```

```
set_ranks(obj, newval)

## S3 method for class 'wlmtest'
set_bandp(obj, newval)

## S3 method for class 'wlmtest'
get_wlmobj(obj)

## S3 method for class 'wlmtest'
get_drop(obj)

## S3 method for class 'wlmtest'
get_signif(obj)

## S3 method for class 'wlmtest'
get_ranks(obj)

## S3 method for class 'wlmtest'
get_bandp(obj)
```

Arguments

object, x, obj	An object of class wlmtest
...	Not currently used. Included for argument consistency with existing generics.
newval	A new value, for the set_* methods

Value

summary.wlmtest produces a summary of a wlmtest object. A print.wlmtest method is also available. For wlmtest objects, set_* and get_* methods are available for all slots (see the documentation for wlmtest for a list). The set_* methods just throw an error, to prevent breaking the consistency between the slots of a wlmtest object.

wmf *Computes the wavelet mean field from a matrix of spatiotemporal data. Also the creator function for the* wmf *class.*

Description

Computes the wavelet mean field from a matrix of spatiotemporal data. Also the creator function for the wmf class. The wmf class inherits from the tts class, which inherits from the list class.

Usage

```
wmf(dat, times, scale.min = 2, scale.max.input = NULL, sigma = 1.05,
  f0 = 1)
```

Arguments

dat	A locations (rows) x time (columns) matrix
times	A vector of time step values (e.g., years), spacing 1
scale.min	The smallest scale of fluctuation that will be examined. At least 2.
scale.max.input	The largest scale of fluctuation that will be examined. Note that if this is set too high relative to the length of the timeseries it will be truncated.
sigma	The ratio of each time scale examined relative to the next timescale. Greater than 1.
f0	The ratio of the period of fluctuation to the width of the envelope

Value

wmf returns an object of class wmf. Slots are:

values	A matrix of complex numbers containing the wavelet mean field, of dimensions length(times) by the number of timescales. Entries not considered reliable (longer timescales, near the edges of the time span) are set to NA.
times	The time steps specified (e.g., years)
timescales	The timescales (1/frequency) computed for the wavelet transforms
dat	The data matrix (locations by time) from which the wmf was computed
wtopt	The inputted wavelet transform options scale.min, scale.max.input, sigma, f0 in a list

wpmf *Wavelet phasor mean field*

Description

Computes the wavelet phasor mean field from a matrix of spatiotemporal data. Also the creator function for the wpmf class. The wpmf class inherits from the tts class, which inherits from the list class.

Usage

```
wpmf(dat, times, scale.min = 2, scale.max.input = NULL, sigma = 1.05,
  f0 = 1, sigmethod = "none", nrand = 1000)
```

Arguments

dat	A locations (rows) x time (columns) matrix
times	A vector of time step values, spacing 1
scale.min	The smallest scale of fluctuation that will be examined. At least 2.
scale.max.input	The largest scale of fluctuation guaranteed to be examined
sigma	The ratio of each time scale examined relative to the next timescale. Should be greater than 1.
f0	The ratio of the period of fluctuation to the width of the envelop
sigmethod	Method for significance testing the wmpf, one of quick, fft, aaft (see details)
nrand	The number of randomizations to be used for significance testing

Details

For sigmethod equal to quick, the empirical wpmf is compared to a distribution of magnitudes of sums of random phasors, using the same number of phasors as there are time series. The signif output is a list with first element "quick" and second element a vector of nrand magnitudes of sums of random phasors. For sigmethod equal to fft, the empirical wpmf is compared to wmpfs of Fourier surrogate datasets. The signif output is a list with first element "fft", second element equal to nrand, and third element the fraction of surrogate-based wpmf magnitudes that the empirical wpmf magnitude is greater than (times by timescales matrix). For sigmethod equal to aaft, aaft surrogates are used instead. Output has similar format to the fft case. Values other than quick, fft, and aaft for sigmethod result in no significance testing.

Value

wpmf returns an object of class wpmf. Slots are:

values	A matrix of complex numbers containing the wavelet phasor mean field, of dimensions length(times) by the number of timescales. Entries not considered reliable (longer timescales, near the edges of the time span) are set to NA.
times	The times associated with the data and the wpmf
timescales	The timescales associated with the wpmf
signif	A list with information from the significance testing. Format depends on sigmethod (see details).
dat	The data matrix (locations by time) from which the wpmf was computed
wtopt	The inputted wavelet transform options scale.min, scale.max.input, sigma, f0 in a list

wt

Computes the wavelet transform of a timeseries. Also the creator function for the wt *class.*

Description

Computes the wavelet transform of a timeseries. Also the creator function for the wt class. The wt class inherits from the tts class, which inherits from the list class.

Usage

```
wt(t.series, times, scale.min = 2, scale.max.input = NULL, sigma = 1.05,
  f0 = 1)
```

Arguments

t.series	A timeseries of real values
times	A vector of time step values (e.g., years), spacing 1
scale.min	The smallest scale of fluctuation that will be examined. At least 2.
scale.max.input	The largest scale of fluctuation that is guaranteed to be examined
sigma	The ratio of each time scale examined relative to the next timescale. Should be greater than 1.
f0	The ratio of the period of fluctuation to the width of the envelope. Defaults to 1.

Value

wt returns an object of class wt. Slots are:

values	A matrix of complex numbers, of dimensions length(t.series) by the number of timescales. Entries not considered reliable (longer timescales, near the edges of the time span) are set to NA.
times	The time steps specified (e.g. years)
wtopt	The inputted wavelet transform options scale.min, scale.max.input, sigma, f0 in a list
timescales	The timescales (1/frequency) computed for the wavelet transform
dat	The data vector from which the transform was computed

Note

Important for interpreting the phase: the phases grow through time, i.e., they turn anti-clockwise.

Examples

```
time1<-1:100
time2<-101:200
ts1p1<-sin(2*pi*time1/15)
ts1p2<-0*time1
ts2p1<-0*time2
ts2p2<-sin(2*pi*time2/8)
ts1<-ts1p1+ts1p2
ts2<-ts2p1+ts2p2
ts<-c(ts1,ts2)
ra<-rnorm(200,mean=0,sd=0.5)
t.series<-ts+ra
t.series<-t.series-mean(t.series)
times<-c(time1,time2)
res<-wt(t.series, times)
```

wt_methods *Basic methods for the* wt *class*

Description

Set, get, summary, and print methods for the wt class.

Usage

```
## S3 method for class 'wt'
summary(object, ...)

## S3 method for class 'wt'
print(x, ...)

## S3 method for class 'wt'
set_times(obj, newval)

## S3 method for class 'wt'
set_timescales(obj, newval)

## S3 method for class 'wt'
set_values(obj, newval)

## S3 method for class 'wt'
set_dat(obj, newval)

## S3 method for class 'wt'
set_wtopt(obj, newval)

## S3 method for class 'wt'
```

```
get_times(obj)

## S3 method for class 'wt'
get_timescales(obj)

## S3 method for class 'wt'
get_values(obj)

## S3 method for class 'wt'
get_dat(obj)

## S3 method for class 'wt'
get_wtopt(obj)
```

Arguments

object, x, obj	An object of class wt
...	Not currently used. Included for argument consistency with existing generics.
newval	A new value, for the set_* methods

Value

summary.wt produces a summary of a wt object. A print.wt method is also available. For wt objects, set_* and get_* methods are available for all slots, i.e., * equal to times, timescales, wtopt, values, and dat. The set_* methods just throw an error, to prevent breaking the consistency between the slots of a wt object.

Examples

```
time1<-1:100
time2<-101:200
ts1p1<-sin(2*pi*time1/15)
ts1p2<-0*time1
ts2p1<-0*time2
ts2p2<-sin(2*pi*time2/8)
ts1<-ts1p1+ts1p2
ts2<-ts2p1+ts2p2
ts<-c(ts1,ts2)
ra<-rnorm(200,mean=0,sd=0.5)
t.series<-ts+ra
t.series<-t.series-mean(t.series)
times<-c(time1,time2)
```

```
h<-wt(t.series, times)
get_times(h)
summary(h)
print(h)
```
